The extent of county drainage was determined for four counties in South Central Minnesota followed by a study of the gemorphic nature of man's drainage in contrast to natural drainage. Selected drainage ditches and low order rivers were sampled for water quality and quantity in order to determine the contributions and timing of nutrient loads from each. Seventy-nine percent of the drainage ditches were found to terminate into rivers and they more than doubled the length of the surface fluvial systems. The closeness of fit of the drainage ditch systems to the low order Strahler classification scheme suggests that man has taken an immature lake-marsh environment and within 100 years created a geomorphically mature fluvial landscape. Nutrient loading by ditches into receiving bodies was found to vary by season, by individual ditch or river, and by stream order indicating that each ditch was unique. Water quality of one ditch during this wet study year was compared to a previous dry year study and the nutrient loading data was consistent and predictable. The most significant loading nutrient chemical parameter to the Minnesota River was found to be nitrate-nitrogen. Flow showed flashy response to storm events in some ditches and some were quite conservative. Sediment load was directly correlated to flow.

GROUND-WATER CONDITIONS AT BEALE AIR FORCE BASE AND VICINITY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
R. W. Page.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $8.75 in paper copy, $5.00 in microfiche. Geological Survey Open-File Report 80-204, April, 1980. 36 p, 7 Fig, 3 Plates, 12 Tab, 44 Ref.

Descriptors: *Groundwater resources, *Water quality, *Hydrogeology, *Aquifer characteristics, *California, Groundwater movement, Well data, Pumping, Water levels, Water supply, Water yield, chemical analysis, *Beale Air Force Base(CA), *Eastern Sacramento Valley(CA).

Ground-water conditions were studied in a 168-square-mile area between the Sierra Nevada and the Feather River in Yuba County, Calif. The area is in the eastern part of the Sacramento Valley and includes most of Beale Air Force Base. Source, occurrence, movement, and chemical quality of the ground water were evaluated. Ground water occurs in sedimentary and volcanic rocks of Tertiary and Quaternary age. The base of the freshwater is in the undifferentiated sedimentary rocks of Oligocene and Eocene age, that contain water of high dissolved-solids concentration. The ground water occurs under unconfined and partly confined conditions. At Beale Air Force Base it is at times partly confined. Recharge is principally from the rivers. Pumpage in the study area was estimated to be 129,000 acre-feet in 1975. In the 1960's, water levels in most parts of the study area declined less rapidly than in earlier years or became fairly stable. In the 1970's, water levels at Beale Air Force Base declined only slightly. Spacing of wells on the base and rates of pumping are such that excessive pumping interference is avoided. Water quality at the base and throughout the study area is generally good. Dissolved-solids concentrations are 700 to 900 milligrams per liter in the undifferentiated sedimentary rocks beneath the base well field. (USGS)

GROUND WATER OVERDRAFTING MUST BE CONTROLLED.
General Accounting Office, Washington, DC.
Available from Supt. of Documents, GPO, Washington, DC 20402. Comptroller General's Report to the Congress, CED-80-96, September 12, 1980. 56 p, 7 Append.

Descriptors: *Overdraft, *Groundwater mining, *Water management(Applied), *Groundwater resources, Saline water intrusion, Aquifers, Water conservation, Water resources development, Water demand, Land subsidence, Surface-groundwater relationships, Pumping, Planning.

The demand for water in many areas of the country is being met by overdrafting ground water. Overdrafting is most serious in the arid and semiarid western states where irrigation of crops accounts for over half of all ground water use. Subsidence caused by overdrafting has caused millions of dollars in damage to surface structures. In coastal areas where ground water levels are lowered by overdrafting the normal flow of freshwater to the ocean is reversed, and salt water moves into freshwater areas. In inland aquifers intrusion may occur when salt water migrates vertically and horizontally into freshwater aquifers. Where surface streams and rivers are geologically interrelated with the underlying ground water aquifers, surface flow may be reduced by overdrafting. When a ground water aquifer is continually overdrafted, the level of the aquifer declines, and more energy is required to pump the water from greater depths It is recommended that the Congress direct the Departments of Agriculture, the Army, and the Interior to require that affected states and commu-

nities implement or have plans to implement a program for controlling ground water pumping, and a conservation program before the start of federally funded water resources or ground water mitigation projects. (Moore-SRC)

4C. Effects On Water Of Man's Non-Water Activities

STREAM-WATERSHED RELATIONSHIPS IN THE MISSOURI OZARK PLATEAU PROVINCE,
Missouri Univ.-Columbia.
M. M. Smart.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-143398, Price codes: A09 in paper copy, A01 in microfiche. PhD Dissertation, August, 1980. 170 p, 12 Fig, 22 Tab, 94 Ref. OWRT-A-111-M0(1), 14-34-0001-9027.

Descriptors: *Land use, *Effects, *Water quality, Streams, Water chemistry, *Watersheds(Basins), *Missouri, Urban drainage, Pastures, Forest watersheds, Evaluation.

Land use is the most influential watershed characteristic determining chemical concentrations of 23 streams that drained watersheds with different land uses, geologic bedrock, and soil associations in the Missouri Ozark Plateau Province. Streams draining watersheds with urban land use had the highest chemical concentrations and streams draining forest watersheds the lowest. Streams draining pasture watersheds were intermediate, more closley resembling streams in overall salinity, and urban streams in nitrogen and phosphorus. Nutrient concentrations increase along a continuum in response to the area of urban or pasture area on the watershed and decrease with increasing forest area. Algal biomass was governed by plant nutrients, streamflow, and morphological characteristics of the stream. Planktonic biomass was determined by TP and NH sub 3-N and is derived from benthic populations. Prediction of stream chemical concentrations and algal biomass from watershed land use can be used to assess changes in streams that may occur as the result of changes on the watershed.

5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

EVALUATION OF PROCEDURES FOR RECOVERY OF VIRUSES FROM WATER-II. DETECTION SYSTEMS,
Severn Trent Water Authority, Coventry (England). Regional Lab.
R. Morris, and W. M. Waite.
Water Research, Vol 14, No 7, p 795-798, July, 1980. 3 Tab, 15 Ref.

Descriptors: *Viruses. *Rivers, *Monitoring, Cultures, Pollutant identification, Cytological studies, Aquatic environment, Water pollution, Testing procedures, Laboratory tests.

The feasibility of one human and two monkey cell systems in monolayers in tubes and flasks and in agar-suspended cells for detecting enteroviruses in river water samples was examined in laboratory tests. Monkey Vero cells proved to be inefficient for the detection of viral pollution. The Buffalo green monkey (BGM) cells generally gave the best recoveries, while the results of virus recovery using the human rhabdomyosarcoma (RD) cells were variable. Cell culture presentation played a major role in the efficiency of viral recovery. Agar suspensions afforded the best recovery of viruses from water samples, followed by tube cultures of cells, then by cell monolayers in flasks. Tests performed on water from the River Sowe using the BGM-agar suspended cell system yielded virus levels varying from 145 to 620 plaque-forming units/liter. The same test method used on the River Avon showed that much lower virus concentrations were present in this river, with an occasional high count of 540 plaque-forming units/liter being detected. It was concluded that BGM- and RD-agar suspended cells were satisfactory for the routine monitoring of aquatic environments. (See also W81-00766) (Geiger-FRC)

ATP AS AN INDICATOR OF TOXICITY,
Texas A and M Univ., College Station. Dept. of Oceanography.
M. C. Kennicutt, II.
Water Research, Vol 14, No 4, p 325-328, April, 1980. 6 Fig, 7 Ref.

Descriptors: *Adenosine triphosphate, *Bioindicators, *Water pollution sources, *Pollutant identification, Aquatic ecosystems, Monitoring, Aquatic life, Toxicity, Sterilants, Organic compounds, Laboratory tests, Analytical techniques, Bioassay, Hydrogen ion concentration.

As previous studies of sewage sludge and water purification techniques had suggested that adenosine triphosphate was a potential candidate as a toxicity indicator, the value of ATP as an indicator of aquatic environmental pollution was examined in laboratory tests. The use of different chemicals for aquatic sample sterilization was also studied. ATP levels were measured using the luciferin-luciferase technique, and the toxins tested were chloroform, acetone, acrolein, and mercuric chloride. Chloroform at 5 ppm induced a 40% reduction in ATP levels after 6 hr of exposure. Mercuric chloride at 1 ppm induced 100% loss of ATP in only 1 hr. Reductions of ATP levels by highly acidic or highly basic pH values were also demonstrated. Since all living organisms contain ATP, the use of this compound as a sensitive indicator of potential pollutants in aquatic environments is recommended for routine use in conjuction with other lethal and sublethal tests for determining aquatic toxicity. The ATP tests also offer rapid results and can be used on a variety of natural waters provided pH parameters are taken into account. Mercuric chloride was preferred over chloroform as an agent to sterilize aquatic samples. (Geiger-FRC)

REDUCTION OF COLIFORM BACTERIA IN TWO UPLAND RESERVOIRS: THE SIGNIFICANCE OF DISTANCE DECAY RELATIONSHIPS,
Leeds Univ. (England). School of Geography.
D. Kay, and A. McDonald.
Water Research, Vol 14, No 4, p 305-318, April, 1980. 7 Fig, 10 Tab, 42 Ref.

Descriptors: *Reservoirs, *Coliforms, *Fluctations, Theoretical analysis, Self-purification, Rainfall, Surface waters, Water quality, Pathogenic bacteria, Limnology, Land use, *England.

Two British upland reservoirs with multiple-use catchment areas were studied from September 1976 to September 1977 for coliform bacteria densities. The catchment-use level is defined in terms of recreation and agriculture. Purification rates for the reservoirs were calculated for different limnological conditions. Results showed that peak loadings of bacteria would occur following heavy rainfalls when waters fill depleted reservoirs. A model is presented that utilizes logarithmic bacterial decay to estimate self-purification by the reservoir. Reduction of coliform bacteria in other reservoirs was examined for comparison. Results indicated that the distance-decay relationships presented were applicable only to the individual impoundment for which they were calculated. The distance-dependent decay function may serve as a useful concept for the catchment manager, to predict not the exact outlet coliform levels but the order of magnitude of purification that could be expected. ANALYSES OF WATER AND DREDGED MATERIAL FROM SELECTED SOUTHERN LOUISIANA WATERWAYS AND SELECTED AREAS IN THE GULF OF MEXICO, 1976-78,
Geological Survey, Baton Rouge, LA. Water Resources Div.
G. R. Stallworth, and H. F. Jordan.
Available from the OFSS, USGS Box 25425, Fed.

Ctr., Denver, CO 80225, Price: $20.75 in paper copy, $4.50 in microfiche. Geological Survey Open-File Report 80-694, June, 1980. 141 p, 9 Plates, 12 Tab, 12 Ref.

Descriptors: *Chemical analysis, *Water analysis, *Dredging, *Environmental effects, *Inland waterways, Water quality, Louisiana, Gulf of Mexico, Basic data collections, Biochemical oxygen demand, Chlorophyll, Coliforms, Effluents, Nutrients, Pesticides, Trace elements, Southern Louisiana waterways.

The U.S. Geological Survey was requested by the U.S. Army Corps of Engineers to provide water-quality data to evaluate the potential environmental effects of (1) dredging activities in selected navigable waterways of southern Louisiana and (2) the disposal of dredged material at selected areas in the Gulf of Mexico. Areas studied from September 1976 to May 1978 included five ocean disposal sites in the Gulf of Mexico, in addition to the following waterways: Baptiste, Collette Bayou, Mississippi River at Head of Passes and Southwest Pass, Mississippi River at Tiger Pass, Bayou Black, Intracoastal Waterway (Port Allen to Morgan City), and Calcasieu River and Ship Channel. Samples were analyzed for selected chemical, physical, and biological constituents. (USGS)

SEMI-QUANTITATIVE DETERMINATION OF FULVIC ACID, TANNIN AND LIGNIN IN NATURAL WATERS,
National Water Research Inst., Burlington (Ontario).
J. Lawrence.
Water Research, Vol 14, No 4, p 373-377, April, 1980. 2 Fig, 4 Tab, 15 Ref.

Descriptors: *Spectrophotometry, *Lignins, *Fulvic acids, Organic compounds, Organic acids, Humic acids, Decomposing organic matter, Aromatic compounds, Water analysis, Wavelengths.

The simultaneous, semiquantitative determination of fulvic acid, tannin and lignin by ultraviolet spectrophotometry is described. Three different wavelengths are used to measure absorbance. Concentrations are calculated using an expanded form of Beer's Law. The method compares well to other analytical methods for naturally occurring organic compounds. The method has accuracy of less than 15% for fulvic acid, less than 30% for tannic acid and less than 50% for lignosulfonic acid. (Baker-FRC)

BIOLOGICAL MONITORING. PART I-EARLY WARNING SYSTEMS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
J. Cairns, Jr., and W. H. Van Der Schalie.
Water Research, Vol 14, No 9, p 1179-1196, September, 1980. 1 Tab, 165 Ref.

Descriptors: *Monitoring, *Reviews, *Water pollution, *Aquatic ecosystems, Pesticides, Waste disposal, Toxicity, Respiration, Nitrification, Environmental effects, Water pollution control, Public health, Fish toxins, Metals, Chlorinated hydrocarbon pesticides.

The first report focusing on early warning systems from a symposium on biological monitoring consisting of six separate reports is presented in a review format. Natural systems have been threatened by contamination with improperly disposed wastes, as was witnessed in large-scale incidents with mercury poisoning and Kepone (chlordecone) pollution. Many chemicals pose a threat to human health as potential carcinogens. Management programs for the disposal of wastes will be needed to assess the ecological impact of various compounds on the environment. Early warning systems will ideally have test organisms exposed in field or laboratory situations to toxins under continuous flow conditions. A physiological or behavioral parameter of the organism should be monitored by a device capable of sensing abnormal responses. Short term changes as opposed to chronic effects are monitored in early warning toxicity tests. Some tests that are applicable to early warning toxicity monitoring include bacterial ATP and porphyrin tests indicating changes in bacterial numbers, oxygen consumption tests, nitrification and various macroinvertebrate response tests. Effects of DDT, carbaryl and dieldrin on heart rate of fish have been investigated. Response times of aquatic organisms to various metals and pesticides including lindane, DDT, pentachlorophenol, endrin, chlordane and parathion are given. Three scenarios for regulation of specific toxicants are outlined which might be implemented for the control of waste disposal. (Geiger-FRC)

Progress in Water Technology, Vol 12, No 1, p 97-108, 1980. 1 Fig, 1 Tab, 26 Ref.

Descriptors: *Sea water, *Benthic fauna, *Mercury, *Bioindicators, *Effluents, Sewers, Water pollution, Cities, Sediments, Industrial wastes, Europe, Sewage, Spectrophotometry, Mediterranean, France.

Flameless atomic absorption spectrophotometry was used to determine mercury levels in marine sediments and benthic plants and animals in the French Mediterranean. Thus, the degree of mercury pollution was estimated. Three species were used as biological indicators of mercury pollution: the red alga Ceramium ciliatum, the marine phanerogam Posidonia oceanica, and the mussel Mytilus galloprovincialis. Highest mercury levels were found in the urban and industrial areas of Marseille and the Gulf of Fos. Mercury concentrations at the Cortiou sewer outfall reached 14.5 ppm in sediments, 0.73 ppm in the sea urchin, 2.90 ppm in the sea cucumber, and 51.50 ppm in the leaves of Posidonia oceanica. These results combined with others indicated that urban sewage, which contains industrial wastes, is a major source of pollution. The pollution, however, was not found to reach dangerous levels. DETERMINATION OF POLYOXYETHYLENE ALKYL ETHER NON-IONIC SURFACTANTS IN WATERS AT TRACE LEVELS AS POTASSIUM PICRATE ACTIVE SUBSTANCES,
Trieste Univ. (Italy). Inst. di Merceologia.
L. Favretto, B. Stancher, and F. Tunis.
Analyst, Vol 105, No 1254, p 833-840, September, 1980. 4 Fig, 3 Tab, 28 Ref.

Descriptors: *Surfactants, *Chemical precipitation, *Testing procedures, *Chemical reactions, *Physical properties, Soaps, Detergents, Water pollution sources, Wastes, Analytical techniques, Chemical properties, Organic compounds, Trace elements.

A method for absolute determination of polyoxyethylene alkyl ether non-ionic surfactants is proposed, in which potassium picrate is used as a precipitating agent. Application of the method to both mono- and poly-disperse surfactants is considered, and the reactivity of these is compared with the reactivity of other p-tert-nonylphenyl surfactants. Non-ionic surfactants, which are widely used in household detergent formulas and derived from industrial production, occur in trace levels in waters receiving untreated urban liquid wastes. Potassium picrate was added to varying concentrations of surfactant. The organic layer was extracted with 1,2-dichloroethane, centrifuged, and the absorbance was measured at 378 nm against the reagent blank. In all instances, the results demonstrated the validity of Beer's Law at trace levels. In all cases a second extraction produced small but significant absorbance. It was shown that n-dodecyl and p-tert-nonylphenyl monodisperse surfactants display maximum slopes of the calibration curves, converging to a limiting value with increasing degrees of polymerization. In polydisperse surfactants, no maximum is observed, but they tend toward the same limit as monodisperse surfactants. This method is effective for surfactants with polyoxyethylene chains which are too short to be precipitated with conventional methods. (Titus-FRC)

SIMPLIFIED METHOD FOR THE DETERMINATION OF CADMIUM, CHROMIUM, COPPER, NICKEL, LEAD AND ZINC IN SEWAGE SLUDGE USING ATOMIC-ABSORPTION SPECTROPHOTOMETRY,
Severn-Trent Water Authority, Malvern (England). Malvern Regional Lab.
K. C. Thompson, and K. Wagstaff.
Analyst, Vol 105, No 1254, p 883-896, September, 1980. 1 Fig, 13 Tab, 34 Ref.

Descriptors: *Heavy metals, *Sewage sludge, *Spectrophotometry, Analytical techniques, Chemical analysis, Cadmium, Chromium, Copper, Nickel, Lead, Zinc, Separation techniques, Testing procedures, Sludge disposal.

The deposition of digested sewage sludge on land may increase levels of certain toxic metals in the soil. An accurate, safe, rapid and simple method for analysis of these metals is presented, using nitric acid digestion in 50 ml calibrated glass tubes for the routine atomic absorption determination of cadmium, chromium, copper, nickel, lead, and zinc. Both wet and dried sludge can be analyzed by this technique. The use of a calibrated tube has advantages over the conventional beaker digestion in respect to the amount of volumetric apparatus required, the ease of digestion and the amount of space needed. Other digestion reagents such as aqua regia, nitric acid-hydrogen peroxide and nitric acid-perchloric acid can also be used with this method. The fractions insoluble in nitric acid were not significant in relation to the disposal of sewage sludge on agricultural land. (Baker-FRC)
W81-00899

RAPID AND SENSITIVE SPECTROPHOTOMETRIC METHOD FOR THE DETERMINATION OF NITRATE IN RAIN WATER USING 3,4-XYLENOL,
Ibadan Univ. (Nigeria). Dept. of Chemistry.
O. Osibanjo, and S. O. Ajayi.
Analyst, Vol 105, No 1254, p 908-912, September, 1980.

Descriptors: *Spectrophotometry, *Nitrates, Rain water, Nitrites, Chlorides, Analytical techniques, Water pollution, Fertilizers, Monitoring, Separation techniques.

An improved spectrophotometric method for determining nitrate in rain water has been developed using 3,4-xylenol. The reagent is nitrated at 0 degrees in 80% sulfuric acid, and the nitration product is extracted into toluene. The excess reagent remains in the aqueous layer. The toluene layer is treated with sodium hydroxide solution to produce a colored sodium salt of nitrophenol. The absorbance of the colored complex is measured at 432 nanometers. No significant interferences occurred in the presence of chloride. Bromide caused interference at 1:100 levels and above, and nitrite at 1:10 and above. Bromide interferences could be corrected with additions of silver sulfate or mercury sulfate, and nitrite interference was corrected by addition of sulfamic acid. Percent recovery of nitrate from spiked samples ranged from 96 to

108%. The technique may also be used for routine determination of nitrate in soils, river sediments and mineral oils. (Geiger-FRC)

IDENTIFICATION OF CHRYSOTILE ASBESTOS BY MICRODIFFRACTION,
Dow Chemical Co., Midland, MI.
D. R. Beaman, and H. M. Baker.
Analytical Chemistry, Vol 52, No 12, p 1983-1984, October, 1980. 1 Fig, 1 Tab, 20 Ref.

Descriptors: *Asbestos, *Electron microscopy, *Pollutant identification, Analytical techniques, Industrial effluents, Spectroscopy, Crystallography.

The analysis of asbestos in waste water effluents, especially of high solids and low chrysotile contents, by transmission electron microscopy presents some inconveniences. The selected area electron diffraction patterns (SAED) on which current asbestos analyses are based pose several problems. One major problem lies in the lack of a consistent classification scheme. Many patterns are initially incomplete, and others will fade within 30 sec to such an extent as to be unidentifiable. This is caused by electron beam induced degradation due to dehydroxylation and carbon contamination. This problem, coupled with differences in instruments, and the presence of fiber coatings or interfering crystalline solids, makes SAED identification unreliable. Subjecting individual fibers to elemental analysis with an energy dispersive spectrometer (EDS) can improve the situation. The use of the microdiffraction mode rather than SAED can aid identification in the diffraction portion of the method. Such analysis provides stable patterns which do not fade in the time required for anlysis of chrysotile asbestos in water and air samples. The EPA interim method with SAED replaced by microdiffraction could be used to test relatively clean water samples such as those from lakes or from tap water. (Baker-FRC)

SOME PROBLEMS IN THE DETERMINATION OF TOTAL RESIDUAL 'CHLORINE' IN CHLORINATED SEA-WATER,
Old Dominion Univ., Norfolk, VA. Inst. of Oceanography.
G. T. F. Wong.
Water Research, Vol 14, No 1, p 51-60, 1980. 6 Fig, 28 Ref.

Descriptors: *Volumetric analysis, *Chlorine, *Sea water, Chlorination, Analytical techniques, Chemical analysis, Effluents, Halogens, Bromine.

Significant errors may occur in using the amperometric titrimetric method to determine the amount of residual chlorine in chlorinated sea water unless specific precautions are taken. If the pH 4 buffer is added to the sample before the potassium iodide solution is added, serious analytical errors will result. Even if the reagents are added only seconds apart, the error will be significant, probably due to the volatilization of molecular bromine. In freshwater samples this practice should also be avoided, as loss of molecular chlorine may result. Even when the potassium iodide is added first, care must be taken to add the acidic buffer not more than 1 minute afterwards. Iodate present in sea water may cause significant uncertainty in determining small quantities of residual chlorine. Clear definitions in the literature for reporting the concentrations of residual chlorine are necessary. The preferred unit is micromolar concentration of hypohalite. (Baker-FRC)

ROLE OF STRONG ION EXCHANGE RESINS IN NITROSAMINE FORMATION IN WATER,
Science and Education Administration, Philadelphia, PA. Eastern Regional Research Center.
W. I. Kimoto, C. J. Dooley, J. Carre, and W. Fiddler.
Water Research, Vol 14, No 7, p 869-876, July, 1980. 9 Tab, 14 Ref.

Descriptors: *Ion exchange, *Resins, *Organic compounds, Potable water, Cations, Anions, Water analysis, Nitrogen compounds, Nitrosamines, Water pollution sources, Toxins, Ammonia.

The passing of tap water through a column containing only anion exchange resin caused formation of N-nitrosodimethylamine (NDMA). This indicated that nitrosamine formation by conventional acid catalyzed nitrosation was not the primary mechanism in NDMA formation. It is suggested that the quaternary ammonium ion of the strong anion resin may be the amine precursor for nitrosamine formation. Low levels of NDMA added to the influent were not able to be concentrated by strong anion and strong cation resins such as Amberlite and Dowex brands. Thus it was concluded that low levels of nitrosamine already present in the water do not contribute significantly to the concentration of nitrosamines found in deionized water. Normal levels of cations, anions, and heavy metals were similarly not responsible for the nitrosamines present in the water after passing through the column. An unknown substance was isolated in tapwater that promoted nitrosamine formation. This substance was able to be removed from the water either by activated carbon treatment or by degassing techniques. (Baker-FRC)

DETERMINATION OF NITRITE ION IN WASTE AND TREATED WATERS BY RESONANCE RAMAN SPECTROMETRY,
Meidensha Electric, Tokyo (Japan). Water Treatment Engineering Div.
N. Furuya, A. Matsuyuki, S. Higuchi, and S. Tanaka.
Water Research, Vol 14, No 7, p 747-752, July, 1980. 7 Fig, 4 Ref.

Descriptors: *Analytical techniques, *Pollutant identification, *Spectrometers, *Nitrites, Nitrates, Chemical analysis, Dyes, Waste water treatment, Water analysis, Resonance.

Resonance Raman spectrometry has been used to determine the concentration of nitrite ions in waste water. As the Raman spectrometry technique requires a colored product for identification, the nitrite is converted to an azo dye product by chemical reaction. The addition of sodium thiocyanate during the procedure reduced the background interference to such a degree that the sensitivity of this method is rated at about 0.5 ppb, which is approximately one order of magnitude lower than the sensitivity of the colorimetric method usually employed for such determinations. The analytical curve obtained for the aqueous solutions of nitrite ion in the concentration range from 10 to 180 ppb fit well enough to a straight line in the concentration range below 140 ppb. The standard deviation for the straight line is very small, 2.70 ppb. Thus the sensitivity of this method is high enough for optimum control of waste water treatment and the technique is practical for waste and treated water samples. The simultaneous determination of nitrite ion and nitrate ion utilizing this process was proposed. (Baker-FRC)

A MODEL PROVISION FOR NON-DEGRADATION OF GROUNDWATER: WHAT IS A DETRIMENTAL EFFECT AND WHERE IS IT MEASURED,
Wisconsin Univ.-Oshkosh. Coll. of Letters and Science.
J. I. Hoffman.
In: Third Annual Madison Conference of Applied Research & Practice on Municipal & Industrial Waste, September 10-12, 1980, p 168-173, 1980. 3 Ref. University of Wisconsin-Extension, Department of Engineering & Applied Sciences, 432 N. Lake Street, Madison, WI 53706.

Descriptors: *Wisconsin, *Aquifer testing, *Waste water(pollution), *Water quality control, *Waste disposal, Degradation, Monitoring, Geochemistry, Attenuation, Reservoirs, Pollution, EPA, Contamination, Subsurface drainage, Water quality standards, Path of pollutants, Model studies, Groundwater.

Non-degradation and zero pollution of water are goal statements which in practice cannot be achieved. Therefore, some measurable parameters must be set so that activities necessary for the existence of society can be evaluated as to compliance with a reasonable standard. A model framework for groundwater protection is presented. The goal should be that no activity will cause a statistically significant deviation from the main geochemistry of the groundwater existing beneath or in potential contact with a proposed activity. For waste disposal facilities, a compliance point is defined as the lesser of 1,200 feet from the source or the project property line, and an intervention point is established at one-half of the above distance. The intervention point is the place where measurements against the standards are to be taken, and correction action employed if necessary. For hazardous wastes, or large activities which involve a site of more than 100 acres, a computer model of groundflow and contamination should be required. (Garrison-Omniplan)

DETERMINATION OF TRIHALOMETHANES (THM) IN WATER USING HIGH EFFICIENCY SOLVENT EXTRACTION,
National Swedish Environment Protection Board, Stockholm (Sweden). Dept. of Environmental Hygiene.
H. Norin, and L. Renberg.
Water Research, Vol 14, No 10, p 1397-1402, October, 1980. 5 Fig, 3 Tab, 18 Ref.

Descriptors: *Gas chromatography, *Organic compounds, *Potable water, *Solvent extractions, *Separation techniques, Analytical techniques, Disinfection, Organic wastes, Monitoring, Rivers, Water pollution, Industrial wastes, Pulp wastes, Trihalomethanes.

A method for the gas chromatographic determination of trihalomethanes (THM) in water using solvent extraction is described. Volatile halogenated hydrocarbons occur in drinking water, natural water and waste waters as a result of industrial pollution or disinfection processes. In the present technique, the organic phase was extracted into a mixture of hexane and diisopropyl ether and was analyzed by gas chromatography. Mean recoveries of THM ranged from 89.0 to 106.0% in spiked samples when a solvent:water ratio of 1:50 was used. Ascorbic acid was recommended for preservation of water samples until analysis time, rather than sodium thiosulfate. The technique has been applied to the monitoring of THM levels in Swedish drinking water and the estimation of THM occurrence in pulp and paper mill effluents. Problems of emulsion formation in the latter studies due to high organic content were overcome by centrifugation. Of the 107 drinking water samples studied, 90% had THM levels in the range of 0.2-25 micrograms/liter. (Geiger-FRC)

A CONVENIENT PARAMETER FOR TRACING LEACHATE FROM SANITARY LANDFILLS,
Wollongong Univ. (Australia). Dept. of Chemistry.
J. Ellis.
Water Research, Vol 14, No 9, p 1283-1287, September, 1980. 1 Fig, 2 Tab, 16 Ref.

Descriptors: *Potassium, *Tracers, *Municipal wastes, *Path of pollutants, *Leaching, Groundwater movement, *Waste dilution, Landfills, Biochemical oxygen demand, Waste disposal, Leachate, Ion transport, Groundwater, Water pollution, Microbial degradation, Chemical degradation, Clays, Discharge.

Large amounts of material of vegetable origin have been identified in typical samples of municipal

wastes. Such constituents are subject to microbial and chemical breakdown producing high biochemical oxygen demands. As a result elevated levels of potassium often occur in the leachate and may serve as an accurate and easily measurable tracer for wastes. Studies of potassium ion levels in water samples collected at monthly intervals from three sampling sites at Russell Vale show this parameter served as a clean indicator of leachate pollution of groundwater. Potassium ion measurements also revealed the direction of movement of the leachate as illustrated in correlations of potassium ion concentrations in waters downstream from a landfill to levels upstream. Potassium ions could not be used to monitor leachate contributions when the inherent water level of this ion was high, when extended passage of leachate through potassium-absorbing clay strata was expected, or when leachate was derived from landfills receiving mainly industrial wastes. Although the cover material was shown previously not to be a source of potassium ion enrichment, care should be taken not to measure possible potassium ion contribution from contact with agricultural fertilizers, concrete and other odd cation sources. (Geiger-FRC)

EVALUATION OF A PORTABLE BARE-ELECTRODE AMPEROMETRIC ANALYZER FOR DETERMINING FREE CHLORINE IN POTABLE AND SWIMMING-POOL WATERS,
New York State Dept. of Health, Albany. Div. of Labs. and Research.
E. Canelli.
Water Research, Vol 14, No 10, p 1533-1540, October, 1980. 1 Fig, 8 Tab, 17 Ref.

Descriptors: *Potable water, *Swimming pools, *Amperometry, *Analytical techniques, *Chlorine, Titration, On-site tests, Sampling, Laboratory tests, Water analysis, Water pollution.

The determination of chlorine as HOCl or ClO(-) was carried out by a bare-electrode portable amperometric analyzer in samples of potable and swimming pool water. The method used no titration and gave rapid and precise results for chlorine levels ranging from 0.10 to 3.0 ppm chlorine. Stoichiometrically equivalent signals were noted for hypochlorite and bromine, triiodide ion, and Mn(VII), but no detectable amperometric signals were observed from MnO2. Interference was observed from N-chloroglycine, NH2Cl, NHCl2 and NCl3. Monochloroisocyanurate, chlorinated bovine albumin, and chlorinated urea gave amperometric signals which were lower than those produced by the N,N-diethyl-p-phenylenediamine (DPD) procedure. When potable water samples were analyzed for free chlorine using the DPD and amperometric method, no significant differences were found between the two sets of results. Field and laboratory tests on swimming pool water samples using both techniques resulted in slightly higher free chlorine values when the DPD method was used. This discrepancy was attributed to the presence of chlorinated urea in the samples, which gives a lower signal in amperometric analyses. (Geiger-FRC)

APPLICATION OF TWO ATTENUATION MECHANISM THEORIES TO A SANITARY LANDFILL,
Wisconsin Dept. of Natural Resources, Madison, Bureau of Solid Waste Management.
A. Bagchi, R. L. Dodge, and G. R. Mitchell.
In: Third Annual Madison Conference of Applied Research & Practice on Municipal & Industrial Waste, September 10-12, 1980, p 201-213, 1980. 8 Fig, 1 Tab, 26 Ref. University of Wisconsin-Extension, Department of Engineering & Applied Sciences, 432 N. Lake Street, Madison, WI 53706.

Descriptors: *Wisconsin, *Attenuation, *Cations, *Leachate, Monitoring, Groundwater, *Landfills, Subsoils, Surface water, Dispersion, Chlorine, Iron, Dilution, Madison area(WI).

Monitoring accuracy for testing cation exchange and dilution as attenuation mechanisms for landfill leachate is examined. Observations at points beneath and downgradient from the Dane County, Wisconsin landfill revealed a change in pH from alkaline toward a neutral value. It is difficult to draw any conclusions regarding the change, since background water quality monitoring data showed a large fluctuation of groundwater hardness through time. Calculations indicated it would take about 200 days for any contaminant to reach the nearest downgradient well. So far, a significant increase in the concentration of the parameters studied has not been observed. Further observation is needed to ensure that monitoring techniques used in the study were adequate to detect the contaminants if they are present. Recommendations for future study include additional downgradient monitoring points at depths calculated using the dispersion theory, and monitoring of upgradient water quality in the same aquifer monitored by the downgradient wells. A program is recommended for periodic leachate analysis to determine the leachate quality through time. (Garrison-Omniplan)

DETAILED REPORT ON THE USE OF ENZYMATIC CYCLING FOR HIGH SPECIFICITY AND PRECISION IN THE COLORIMETRIC ANALYSIS OF AMMONIA,
American Univ., Washington, DC. Dept. of Chemistry.
F. W. Carson, and H. W. Davies.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-145070, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Research Center, University of the District of Columbia, Washington, Report No 21, October, 1980. 80 p, 13 Fig, 11 Tab, 47 Ref. OWRT-B-011-DC(1).

Descriptors: *Ammonia, *Nitrogen compounds, *Analytical techniques, *Colorimetry, *Water analysis, *Methodology, Waste water(Pollution), Ammonium compounds, Ammonium salts, Analysis, Assay, Color reactions, Laboratory tests, Research and development, Testing, Testing procedures, Measurement, Calibrations, Evaluation, Estimating, Monitoring, Statistics, Technology, Waste identification.

A new method was developed for the determination of ammonium ion concentrations in water in the range of 0.0001-0.00001 molar, based upon enzymatic cycling. The sensitivity of the method could be extended well below the ten nanomoles/sample limit of determination, using suitable modifications of the procedure. This two-step method involved the use of an ammonia-specific glutamate dehydrogenase enzyme reaction with simultaneous oxidation of NADH; followed by an enzymatic cycling reaction to measure oxidized NADH by means of measuring the cycling reaction product, a tetrazolium formazan, in the visible at 600 nm. Using the procedure, linear plots of absorbance versus original ammonium ion concentration had correlation coefficients of 0.997-0.9998. The precision (coefficient of variation) of the method on replicate analyses of samples containing 0.0000441 molar ammonium ion was 2%. A calibration curve for determination of unknown ammonium concentrations could be constructed from standard solutions carried through the procedure. Analysis time per sample was three hours, and all solutions were stable for at least two weeks. (Zielinski-IPA)

5B. Sources Of Pollution

NITRATE FLUCTUATIONS IN GROUND WATER AS INFLUENCED BY USE OF FERTILIZER,
Connecticut Agricultural Experiment Station, New Haven.
H. C. DeRoo.
Bulletin 779, June, 1980. 13 p, 6 Fig, 8 Tab, 26 Ref.

Descriptors: *Nitrates, *Connecticut, *Groundwater, *Fertilizers, *Leachate, Tobacco, Nitrogen, Pollution, Organic compounds, Percolation, Soil types, Irrigation.

Fertilizers are often cited as sources of nitrogen in ground and surface water in suburban and rural areas. The most important nitrogen compounds found in soil solutions are ammonium and nitrate nitrogen (NO3-N). Nitrate nitrogen can be leached by heavy rain and eventually appear in ground and surface water. It is a component of the fertilizers studied on two types of terrain---farmland and suburban turf---to determine if they contribute to nitrate pollution of groundwater in the Connecticut River Valley. Groundwater under the Valley Laboratory Farm averaged 3mgL-1 nitrate nitrogen over three years, with temporary concentrations exceeding 10mgL-1 after a heavy rainfall, as observed downstream from areas treated with generous amounts of fertilizer. on the Merrell Farm in Suffield, a rural environment, there were yearround high levels of nitrate nitrogen, averaging 20mgL-1. The groundwater under suburban turf plots was not significantly influenced by moderate fertilization treatments, suggesting that the potential for nitrate leaching under turf is not significant if a reasonable N fertilizer program on lawns is followed. (Garrison-Omniplan)

TRANSPORT OF POTENTIAL POLLUTANTS IN RUNOFF WATER FROM LAND AREAS RECEIVING ANIMAL WASTES: A REVIEW,
North Carolina State Univ. at Raleigh. Dept. of Biological and Agricultural Engineering.
R. Khaleel, K. R. Reddy, and M. R. Overcash.
Water Research, Vol 14, No 5, p 421-436, May, 1980. 6 Tab, 54 Ref.

Descriptors: *Water pollution sources, *Farm wastes, *Nutrients, *Agricultural runoff, Snowmelt, Feed lots, Pastures, Ranges, Rainfall-runoff relationships, Chemical oxygen demand, Pathogenic bacteria, Path of pollutants, Ultimate disposal.

Literature on the quality of agricultural discharges from lands receiving animal wastes, the effects of climate, rates and timing of manure applications, and management practices relative to the transport of nitrogen and phosphorus nutrients, oxygen demanding compounds, and pathogens is reviewed. Pastures and rangelands where animals deposit wastes directly, croplands and other lands receiving mechanically spread animal wastes, and feedlots are considered. For lands receiving manure applications, linear regression analysis showed a highly significant correlation between nitrogen or phosphorus nutrient loading rates and both its average concentration in runoff water and its mass yield. Nutrient and COD losses were considerably higher when manure was applied on land subject to snowmelt runoff or within one day of significant rainfall. Thus higher concentrations and mass yields result from applications in spring and winter than in summer and fall. Applications of manure in solid form and as incorporated in soil result in low nutrient loss, but liquid injected application essentially eliminates pollutants in runoff. Pathogenic organisms are retained mostly at or near the soil surface, which creates great potential for surface runoff water pollution. Nutrient losses from pastures and rangelands are rarely significant and may be controlled with proper grazing schedules and by controlling erosion, sediment transport, and surface runoff. Pollutant concentrations are higher in feedlots by several orders of magnitude, with snowmelt runoff a principal factor. Future research should be directed to relating data on small plot-sized areas to larger watersheds and edge-of-field losses to receiving waters. (Just-FRC)

THE EFFECT OF PHYSICOCHEMICAL, PHYTOPLANKTON AND SEASONAL FACTORS ON FAECAL INDICATOR BACTERIA IN NORTHERN BRACKISH WATER,
Elainlaaketieteellinen Korkeakoulu, Helsinki (Finland).
J. Hirn, H. Vijamaa, and M. Raevuori.
Water Research, Vol 14, No 3, p 279-285, March, 1980. 5 Fig, 3 Tab, 20 Ref.

Descriptors: *Bioindicators, *Water quality, *Aquatic bacteria, *Fluctuations, *Gulfs, *Nutrients, Hydrogen ion concentration, Phytoplankton,

Sampling, Coliform bacteria, Seasonal, Brackish water, Laboratory tests, Streptococcus, Clostridium, Eutrophication, Statistical analysis, Temperature, Nitrogen, Salinity, Nitrates, Nitrites, Salmonella, Phosphorus, Finland.

Seasonal, physicochemical, and phytoplankton parameters were examined in relation to the number of coliforms, fecal coliforms, fecal streptococci, and Clostridium perfringens at several stations in the brackish waters of the Gulf of Finland. The study period lasted for 1 year, over which seasonal changes in the fecal indicator bacteria were noted. A significant correlation was found among the various species of non spore-forming fecal indicator bacteria investigated. Temperature and pH were found to have a marked effect on the number of fecal indicator bacteria. Some nutrients, especially total nitrogen and nitrate nitrogen, also played a role in influencing the number of fecal indicator bacteria present. The lack of correlation between C. perfringens and the other indicator bacteria was attributed to changes in pH values. It was concluded that C. perfringens would be useful as an indicator organism in ecosystems containing many stress factors. Since stress factors may affect the number of fecal indicator bacteria present, it was advised that the quality of water be evaluated using several parameters. (Geiger-FRC)

OCCURRENCE OF SULPHATE REDUCING BACTERIA IN THE HUMAN INTESTINAL FLORA AND IN THE AQUATIC ENVIRONMENT,
Institut Pasteur, Paris (France). Domine du Certia.
H. Leclerc, C. Oger, H. Beerens, and D. A. A. Mossel.
Water Research, Vol 14, No 3, p 253-256, March, 1980. 3 Fig, 3 Tab, 14 Ref.

Descriptors: *Enteric bacteria, *Water pollution, *Sewage treatment, *Sulfur bacteria, *Bioindicators, E. coli, River waters, Potable water, Secondary treatment, Sewage sludge, Sewage bacteria, Activated sludge, Cultures, Sampling, Laboratory tests, Chlorination, Monitoring.

A total of 609 samples of water, sludge, and human stools was examined for the presence of sufate-reducing bacteria. A random choice of 325 of these samples was studied for the presence of E. coli. Of the water samples, 220 were from tap water, 45 from rivers, 61 from influents, 30 from primary sewage effluent, 65 from secondary sewage effluent, and 45 from activated sludge. Sulfate reducing bacteria were detected at a mean rate of 1,000,000/100 g of feces, 1,000,000/100 ml of crude sewage, 100,000/100 ml of river water and about 100/100 ml of tap water. Some similarities were found in distribution curves of sulfate-reducing bacteria and E. coli in some types of water. The occurrence of sulfate-reducing bacteria at high levels in various types of water suggests their fecal origin. However, the high resistance of sulfate reducing bacteria to extraenteric conditions and the complicated techniques required for their detection make them inappropriate as indicator organisms for routine environmental pollution monitoring. DEVELOPMENT OF MODELS TO PREDICT QUALITY OF RUNOFF WATER FROM AGRICULTURAL WATERSHEDS,
Tennessee Univ., Knoxville.
C. H. Shelton, and G. M. Lessman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-143380, Price codes: A03 in paper copy, A01 in microfiche. Tennessee Water Resources Research Center, University of Tennessee, Research Report No 77, September, 1980. 35 p, 6 Fig, 11 Tab, 11 Ref. OWRT A-047-TENN(1).

Descriptors: *Model studies, *Agricultural runoff, Forecasting, *Water quality, *Sediment yield, Nutrients, Metals, Sewage sludge, Agricultural practices, Runoff, Coliforms, Groundwater, Aricultural watersheds.

Municipal sewage sludge following primary sedimentation was applied on a 3.7-ha watershed during four winter months of 1976, 1977, and 1978 at rates of 20.8, 25.7 and 25.2 t/ha (dry weight), respectively. Samples of the sludge, surface runoff, groundwater, soil, and corn leaves were analyzed for selected nutrients and metals. Concentrations of metals and nutrients in runoff were generally low and constant throughout the sampling period. Infrequent high concentrations of nutrients and metals, as well as fecal coliform count, were attributed to runoff occurring soon after applications of sludge when little or no vegetation was present. Concentrations of metals in groundwater sampled in the third year of sludge applications generally showed no increase over those in surface runoff. Data used for generation and testing of regression equations to predict sediment yield were obtained from a total of 145 runoff events on four small (3.7-80.4 ha) agricultural watersheds during the period 1974-1979. Attempts were made to modify the universal soil loss equation by inserting various combinations of watershed and climatic variables to describe conveyance and antecedent conditions. A stepwise linear regression of variables after logarithmic transformation accounted for more variation in sediment yield on two watersheds than other forms of equations attempted. Due to major differences in land use, however, a separate sediment-yield prediction equation was required for each of the four watersheds.

MICROBIOLOGICAL EVALUATION OF COASTAL WATERS QUALITY IN THE TYRRHENIAN SEA,
Genoa Univ. (Italy). Inst. of Hygiene.
F. L. Petrilli, G. P. De Renzi, P. Orlando, and S. De Flora.
Progress in Water Technology, Vol 12, No 1, p 129-136, 1980. 4 Fig, 1 Tab, 10 Ref.

Descriptors: *Sea water, *E. coli, *Streptococcus, *Viruses, *Coliforms, *Sewage bacteria, Tyrrhenian Sea, Microbiology, Water quality, Beaches, Coasts, Public health, Europe.

The microbiological quality of coastal waters in the Tyrrhenian Sea was evaluated in a four year study. Animal viruses were concentrated from sea water samples and sediments by adsorption of insoluble polyelectrolytes. Total coliforms were detected using the multiple tube fermentation test. Fecal streptococci were detected using the membrane filter method. Isolated viruses included types 1, 2, and 3 poliovirus, echovirus, one strain of reovirus, and unidentified enteroviruses. The virus titer ranged from 0.6 to 16 TCD50 per 100 ml of surface sea water, from 0.2 to 1.2 for bottom water, and from 4 to 40 for sediment eluates. The bacteriological load of the pollution in the area was highly variable. Most bathing areas were below 100 E. coli in 100 ml sea water, a limit set by Italian sanitary authorities. A positive correlation was found between total coliforms and E. coli, between total coliforms and fecal streptococci, and between E. coli and fecal streptococci. A significant positive correlation was also found between the numbers of E. coli and enteroviruses. The terminal tracts of two rivers, the Calambrone and the Cecina, were included in the coastline studied. The Cecina river, which receives a number of sewage effluents, was highly polluted, while the pollution load introduced by the Calambrone river was relatively low. (Small-FRC)

SANITARY AND AESTHETIC QUALITY OF THE COASTAL WATERS OF SPAIN,
Ministry of Public Health and Social Security, Madrid (Spain).
R. Mujeriego, and B. Sanchez Murias.
Progress in Water Technology, Vol 12, No 1, p 119-127, 1980. 6 Tab, 6 Ref.

Descriptors: *Sea water, *Coliforms, *Sewage bacteria, *Epidemiology, *Morbidity, Water quality, Beaches, Europe, Public Health, Mathematical studies, Spain.

The degree of pollution at the beaches and coastal areas of Spain was evaluated during the summers of 1977 and 1978. Microbiological water quality was recorded at selected beaches, and standardized epidemiological studies were carried out among people using the beaches. The multiple dilution technque was used to determine total coliform and fecal coliform concentrations in sea water. Approximately 15 to 30% of the areas studied could not be considered microbiologically satisfactory according to national and international water quality standards. The eidemiological study utilized 16,693 valid questionaires from 10 coastal provinces. No statistically significant correlation was found between morbidity rates for skin eruptions, or eye, ear, and nose infections and local sea water quality expressed in terms of total coliforms. There was a significant correlation between morbidity rates for mycosis and total coliform concentrations. (Small-FRC)

DISTRIBUTION OF HEAVY METALS IN THE SUPERFICIAL MARINE SEDIMENTS IN THE VICINITY OF THE RHONE MOUTHS,
Nice Univ. (France). Lab. de Sedimentolgie.
A. Added, F. Fernex, and F. Rapin.
Progress in Water Technology, Vol 12, No 1, p 89-96, 1980. 8 Fig, 11 Ref.

Descriptors: *Sea water, *Sediments, *Rivers, *Heavy metals, Water pollution, Mercury, Lead, Cobalt, Nickel, Zinc, Cadmium, Spectrophotometry, Copper, France, Rhone River, Transport, *Path of pollutants.

The transport of heavy metals to the sea by the Rhone River was investigated by analysis of sur-

face marine sediments within 20-30 km of the mouth of the river. The sediment samples were passed through a 63 micron sieve, and atomic absorption spectrophotometry was performed, followed by extraction in concentrated nitric-perchloric acid. The highest concentrations of metals were found near the river's mouth, with the exception of mercury, which was also high in the Golfe of Fos region. Concentrations in mg/kg were: 31-145 for Pb, 1-14 for Co, 13-32 for Ni, 70-160 for Zn, 18-50 for Cu, 0.14-1.5 for Cd, and 0.08-1.93 for Hg. This first phase of the analysis of results includes concentration contour maps. (Small-FRC)

PROBLEMS OF STORAGE OF VARIOUS SUBSTANCES FOUND IN THE INTERSTITIAL WATERS OF THE SURFACE SEDIMENTS OF THE FRENCH CONTINENTAL SHELF,
Station Marine, Villefranche-sur-Mer (France). Laboratoire Geodynamique Sous-marine.
C. Bagliniere, J. Cenciarini, F. Fernex, R. Pucci, and R. Vaissiere.
Progress in Water Technology, Vol 12, No 1, p 79-87, 1980. 7 Fig, 17 Ref.

Descriptors: *Sediments, *Sea water, *Nutrients, *Surfactants, Detergents, Ammonium compounds, Ions, Water pollution, Europe, Mediterranean, Cote d'Azur, Continental shelf, France.

The concentrations of a number of substances or ions existing in dissolved form in interstitial waters of superficial sediments of the continental shelf of the Cote d'Azur were determined. These substances include nutrients and anionic surfactants. Conentrations varied with region and time of year. For example, in November 1978, following a long period of good weather, the ammonium concentrations were very high in the superficial sediments of the Bay of Nice, reaching 1000 micrograms/liter. In January, the concentrations decreased as much as 100 times. There were no clear correlations between the various parameters studied. Thus, there were opportunities for dissolved nutrients, detergents, etc. stored in the interstitial waters to be liberated into the sea water, but the reasons for variations in rate of liberation are not yet known. The concentrations of anionic surfactants found in the Nice region were surprisingly low; this may be due to efficient waste water purification by this municipal system or to rapid biodegradation. (Small-FRC)

DISPERSANTS FOR ELIMINATING OIL SPILLS (AGENTES DISPERSANTES PARA ELIMINAR DERRAMES DE PETROLEO),
Carretera de Valldemosa, Palma de Mallorca (Spain). Dept. of Chemical Engineering.
M. Estrades, and J. R. Bergueiro.
Progress in Water Technology, Vol 12, No 1, p 35-48, 1980. 4 Tab, 6 Ref.

Descriptors: *Dispersion, *Sea water, *Oil, *Oil pollution, Water pollution, treatment, Oil spills, Salinity, Laboratory tests, Mixing, Surfactants, Non-ionic dispersants.

Experiments revealed that the dispersion of crude oil in sea water is influenced more by the velocity of agitation than by the dispersant/crude oil ratio. A non-ionic dispersant, Renex 690, and a Kiruk-type crude oil were used in sea water with a saline level greater than 5 g/liter. Changes in the concentration of crude oil in the sea water relative to the duration and velocity of agitation were determined. Optimum dispersion was obtained by stirring at 4000 rev/min. The optimum dispersant/oil ratio was 0.35 g. Regression analysis with 90% confidence limit indicated a 3% deviation from the mean with 15% dispersion. (Small-FRC)

BASELINE LEVELS OF HEAVY METALS IN THE WATERS AND SEDIMENTS OF BAFFIN BAY,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Atlantic Oceanographic Lab.
J. A. Campbell, and D. H. Loring.
Marine Pollution Bulletin, Vol 11, No 9, p 257-261, September, 1980. 1 Fig, 3 Tab, 22 Ref.

Descriptors: *Heavy metals, *Sea water, *Sediments, *Bays, Spectrophotometry, Iron, Manganese, Baffin Bay, Greenland, Cadmium, Chromium, Cobalt, Copper, Zinc, Mercury, Nickel, Baseline studies.

Baseline trace metal studies of both the waters and sediments of Baffin Bay, Greenland, were performed. Samples from the principal water fluxes and deep bay water were analyzed by flameless atomic absorption spectrometry following chelation (solvent extraction or ion exchange techniques). Sediment samples were obtained at water depths from 93 to 2320 m and sedimentological and chemical analyses were carried out. Concentrations of Cr, Mn, Fe, Ni, Cu, and Cd in water samples were generally lower than those observed in eastern Canadian coastal waters. Levels were close to those found in open ocean samples. Near shore sediment samples had comparable concentrations of Cr, V, Mn, Ni, Co, Cu, Zn, Hg, and Pb to unpolluted muds in eastern Canadian coastal regions. Concentrations of these elements in deep water sediments closely resembled levels in Atlantic Ocean deep-sea clays. (Small-FRC)

METHYLATION OF LEAD IN MARINE SEDIMENTS,
Institute of Ocean Sciences, Sidney (British Columbia). Ocean Chemistry Div.
J. A. J. Thompson, and J. A. Crerar.
Marine Pollution Bulletin, Vol 11, No 9, p 251-253, September, 1980.

Descriptors: *Sediments, *Lead, Mine wastes, Fjords, Coasts, Methane bacteria, Water pollution sources, Canada, British Columbia, Methylation, Aquatic microbiology.

Sediments were collected from a northern British Columbia fjord, Alice Arm, and three other coastal locations, to study the possible release of lead from mine tailings deposited in Alice Arm. The comparative abilities of the four sediments to support biologically mediated methylation of lead added in three chemical forms were determined. Lead as Pb(OAc)2 was not methylated under the experimental condition used. About 0.03% of lead as Pb(NO3)2 underwent methylation. Tetravalent lead, as (CH3)3PbOAc, was methylated almost completely. However, it is unlikely that (CH3)3PbOAc would be present under natural conditions. The sediments from the four locations showed little variation in methylating capacity, and there was no relationship between methylating capacity and the total ambient lead concentration. The lead contained in the mine tailings was not mobilized in detectable amounts. Thus, the lead in the samples was mostly unavailable to biological processes. (Small-FRC)

LABORATORY STUDIES ON THE ADSORPTION OF ACRYLAMIDE MONOMER BY SLUDGE, SEDIMENTS, CLAYS, PEAT AND SYNTHETIC RESINS,
Plymouth Polytechnic (England). John Graymore Chemical Labs.
L. Brown, K. C. C. Bancroft, and M. M. Rhead.
Water Research, Vol 14, No 7, p 779-781, July, 1980. 1 Fig, 2 Tab, 9 Ref.

Descriptors: *Adsorption, *Resins, Clays, Sediments, Sludge, Peat, Plastics, Waste water treatment, Toxins, Hydrogen ion concentration, Rivers, Chemical degradation, Acrylamide, Organic compounds.

The polyacrylamides are often contaminated by the highly toxic acrylamide monomer during their manufacture. Polymers are used extensively in water treatment processes; standards limit the level of acrylamide in potable water to 0.25 micrograms/liter. Long term analysis of the adsorption of acrylamide by sludges under environmental conditions has been hindered by the rapid degradation of the acrylamide monomer in non-sterile environments. The removal of acrylamide monomer from the water column by adsorption onto sludge, peat, and sediment particles was examined in short-term experiments. No significant adsorption of acrylamide monomer was found. Other studies showed that no acrylamide was rmoved from sterilized river water by clays and anionic, cationic or hydrophobic resins at various concentrations and pH levels tested. A limited affinity for acrylamide was found in activated carbon, which was not affected by pH in the range investigated. (Geiger-FRC)

MODEL STUDIES OF THE DEGRADATION OF ACRYLAMIDE MONOMER.
Plymouth Polytechnic (England). John Graymore Chemical Labs.
L. Brown, M. M. Rhead, K. C. C. Bancroft, and N. Allen.
Water Research, Vol 14, No 7, p 775-778, July, 1980. 3 Fig, 1 Tab, 7 Ref.

Descriptors: *Organic compounds, *Microbial degradation, *Model studies, *Plastics, Biodegradation, Anaerobic bacteria, Aerobic bacteria, Photosynthetic bacteria, Waste water disposal, Sampling, Acrylamides.

Factors which are likley to affect the residence time of acrylamide in natural and polluted waters are discussed. Acrylamide degraded in all unsterilized natural and polluted water samples studied. The major cause of acrylamide loss from spiked water samples was microbial degradation. The ability to degrade the chemical is widespread among natural bacterial stocks found in river, estuarine and sea water samples. In situations where light is available the major decomposers will be photosynthetic, while nonphotosynthetic bacteria predominate in darker regions. Light did not significantly alter the degradation of acrylamide; however, degradation did occur more rapidly in light than in dark after deaeration. This suggests that certain nonphotosynthetic aerobic and photosynthetic and nonphotosynthetic anaerobic bacteria in the samples tested had the capability to degrade acrylamide. Sterile samples of tap water taken at Plymouth showed no chemical degradation occurring over 2000 hr. It is suggested that the industrial addition of strong acids, bases, oxidizing or reducing agents to process waste waters may aid in degrading acrylamide. (Baker-FRC)

VIRUS INTERACTIONS WITH SOIL COMPONENTS: MEASUREMENTS AND USE FOR PREDICTING MOVEMENT DURING LAND APPLICATION OF MUNICIPAL WASTEWATER,
California Univ., Los Angeles. Dept. of Chemical, Nuclear and Thermal Engineering.
V. L. Vilker.
In: Third Annual Madison Conference of Applied Research & Practice on Municipal & Industrial Waste, September 10-12, 1980, p 34-53, 1980. 12 Fig, 22 Ref. University of Wisconsin - Extension, Department of Engineering & Applied Sciences, 432 N. Lake Street, Madison, WI 53706.

Descriptors: *Viruses, *Waste water disposal, *Sands, *Clays, *Adsorption, Sorption, Percolation, Sewage, Effluent, Attenuation, Filtration, Soils, Electron microscopy, Entrapment.

Growing interest in various forms of water reuse, and an increased awareness concerning public health aspects of wastewater disposal, require better understanding of the fate of human pathogens contained in domestic raw sewage. Studies on the fate of viruses in soil-water environments and recent research on the specific interactions of attenuated poliovirus I with sand and clay are summarized. The results concerning sand indicate that adsorption sites occupy about 1.5% of the total sand particle surface area. There is also indication that the adsorption reaction of polio to sand is weak. The clay interaction was examined both optically and with electron microscopy which gave reasonable assurance that poliovirus is removed from clay suspensions of batch equilibrium experiments by the adsorption mechanism. The

poliovirus preparations and the batch adsorption mechanism suspensions were of the same composition in both the sand and clay studies. Further study of the movement of poliovirus through laboratory packed beds of sand and sand/clay mixtures, to assure that clay aggregation effects are absent or minimized, would be desirable. OZONE-INDUCED BIODEGRADABILITY OF A NON-IONIC SURFACTANT,
Environmental and Water Resources Engineering, Haifa (Israel).
N. Narkis, and M. Schneider-Rotel.
Water Research, Vol 14, No 9, p 1225-1232, September, 1980. 6 Fig, 2 Tab, 24 Ref.

Descriptors: *Ozone, *Surfactants, *Waste water treatment, *Chemical oxygen demand, *Biodegradation, Ultraviolet radiation, Organic wastes, Sewage effluents, Biological treatment, Molecular structure, Waste treatment, Separation techniques.

The OECD (Organization for Economic Cooperation and Development) screening test for biodegradability was modified to test the ozone-induced biodegradability of a non-ionic surfactant, branched chain nonyl phenol ethoxylate. Ozonized solutions and blanks were seeded with 1 ppm filtered sewage treatment plant effluent, shielded from light and placed in shaking devices at 25 degrees. Samples were drawn and analyzed at different time periods for COD and TOC (total organic carbon) levels and changes in UV spectrum adsorption. Results showed that the efficiency of removal of non-ionic surfactants increased with increasing ozone doses. Biodegradation after ozonation resulted in overall removals of 70% COD and 62.5% of the TOC as compared with an 8 to 25% removal of COD and a 23% removal of TOC with biodegradation of the non-ozonized non-ionic surfactant. The enhanced biodegradability in ozonated preparations was attributed to changes in molecular structure of the non-ionic surfactant which were demonstrated in its UV spectrum and its chemical reaction with ammonium cobaltothiocyanate. VARIATIONS IN WATER QUALITY DURING WINTER IN TWO YUKON RIVERS WITH EMPHASIS ON DISSOLVED OXYGEN CONCENTRATION,
British Columbia Univ., Vancouver. Dept. of Soil Science.
H. Schreier, W. Erlebach, and L. Albright.
Water Research, Vol 14, No 9, p 1345-1351, September, 1980. 9 Fig, 2 Tab, 7 Ref.

Descriptors: *Rivers, *Dissolved oxygen, *Water quality, *Seasonal, *Ice cover, *Alaska, Sampling, Monitoring, Environmental effects, Trace metals, Nutrients, Fluctuations, Groundwater, Aeration, Alcan pipeline.

In view of the increasing development of energy sources in the Arctic and the lack of information on the baseline water quality of the rivers of this area, some winter variations in water quality were studied in an arctic and subarctic river basin in the Yukon Territory. This project was undertaken as part of the environmental impact analysis program for the Alcan pipeline conducted by the Department of the Environment, Inland Waters Directorate. The Swift River of the Southern Yukon and the Ogilvie River in the Northern Yukon Territory were sampled over a one year period for dissolved oxygen (DO), minerals, selected trace metals, nutrients, nitrogen, organic components, pH, and specific conductance. Depressions in DO were noted in both rivers during the winter when ice cover was present. In late winter, DO levels were the lowest while concentrations of basic cations were at a maximum. No relationships were found between oxygen levels and ice thickness or type. More groundwater low in DO was present as winter progressed and ice cover offered little chance for aeration. Other contributing factors to the low DO were oxygen uptake by suspended solids and by biota. These results support other studies showing low DO levels in Alaskan environments in the late winter. RAIN WATER LEACHATES OF HEAVY METALS IN ROAD SURFACE SEDIMENTS,
Middlesex Polytechnic, London (England).
D. M. Revitt, and J. B. Ellis.
Water Research, Vol 14, No 10, p 1403-1407, October, 1980. 2 Fig, 1 Tab, 16 Ref.

Descriptors: *Leaching, *Heavy metals, *Surface runoff, *Water pollution sources, *Drainage water, Storm water, Paving, Cadmium, Lead, Manganese, Toxicity, Particle size, Benthos, Sediments, Storm drains, Construction materials.

It has been shown that certain street surface sediments can contribute to the heavy metal pollution of stormwater drainage systems. The extractabilities of heavy metals from London street particles of different sizes were compared under simulated storm water flow conditions. Samples of street surface and roadside gutter sediments of separate catchment areas were examined for heavy metal leachability using rainwater of pH 6.5. Levels of Pb, Cd and Mn were determined by atomic absorption spectrophotometry in sediment preparations removed from rainwater after 1, 5, 11, 15, or 28 days. Solubility curves varied with time. Results of sorption and desorption experiments showed that Cd tended to desorb more rapidly from fractions with grain sizes greater than 250 micrometers. Heavy metal leachate patterns in areas of high and low motor vehicle traffic showed no significant differences. The overall extraction efficiency of Cd was found to be 10 times that of Mn which was, in turn, 100 times that of Pb. Mn showed the greatest potential for attaining equilibrium in rainwater samples. Under heavy storm conditions, enrichment of heavy metals through leaching from street pavings might cause toxic effects on benthic organisms. (Geiger-FRC)

CONTAMINATION OF FRESH WATER AQUIFERS BY OIL SPILLS,
Department of Energy, Morgantown, WV. Morgantown Energy Technology Center.
K. I. Kamath, J. Pasini, and B. J. Kush.
In: Third Annual Madison Conference of Applied Research & Practice on Municipal & Industrial Waste, September 10-12, 1980, p 174-186. 4 Fig, 3 Ref. University of Wisconsin-Extension, Department of Engineering & Applied Sciences, 432 N. Lake Street, Madison, WI 53706.

Descriptors: *Contamination(Water), *Oil pollution, *Oily water, *Fluid flow, *Aquifers, Well drilling, Groundwater, Reservoirs(Oil), Water quality, Flow rates, Darcys Law.

The flow and distribution of spilled water-immiscible liquids within sand and gravel aquifers is discussed on the basis of the theory of multi-phase fluid flow through porous media and water well hydraulics. In an aquifer fully saturated with water, the flow is homogeneous or 'single-phase.' Air in the strata with the water is described as a 'two-phase' flow. The water can also be associated with immiscible or partially miscible liquid instead of air, thus altering the flow and posing potential water quality problems. Fluid flow sufficiently contaminated with oil can be in two distinct stages. In Stage I, the oil saturation at the contaminated section of the aquifer is above its residual value. Invasion by air of an oil-contaminated aquifer with a stabilized residual oil saturation represents Stage II. An oil spill will ultimately result in the dispersion of the oil into the aquifer pore systems as a 'residual' immobile phase, possibly modified by gravity effects. Aquifer contamination by buried 'oil wastes' is a serious problem and the damage may be irreversible. The problem of decontamination of an aquifer after an oil spill is nearly identical to that of the tertiary recovery of crude oil, but with even more constraints. Tertiary oil recovery also poses potential contamination situations. There are few practical inexpensive means to decontaminate affected aquifers except by drilling emergency wells to apply solvents or other fluids to the spill to recover and dispose of the contaminats. There is a need for preventive rather than curative methods for oil spill control. (Atkins-Omniplan)

UNDERGROUND RESIDENCE TIMES AND CHEMICAL QUALITY OF BASAL GROUND WATER IN PEARL HARBOR AND HONOLULU AQUIFERS, OAHU, HAWAII,
Hawaii Univ., Honolulu.
T. H. Hufen, P. Eyre, and W. McConachie.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-135444, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Research Center, Honolulu, University of Hawaii, Technical Report 129, February, 1980. 83 p, 1 Fig, 1 Tab, 24 Ref, 1 Append. 14-31-0001-3811.

Descriptors: *Hawaii, *Water pollution control, *Groundwater resources, *Aquifer management, *Aquifer testing, *Isotope studies, Time of concentration, Chemical analysis, Oil spills, Subsurface waters, Radioactive waste disposal, Underground storage, Contamination(Water), Organic compounds.

The deterioration in chemical quality of basal water with underlying saline water is of utmost concern on Oahu, where the Pearl Harbor and Honolulu groundwater systems constitute a primary source of fresh water. This study uses isotope and chemical analyses to investigate the storage and flow of the systems of six areas in southern Oahu. Potential origins of waters were determined by using mixing models and chemical compositions of water samples from sources located within a few miles of each other. Striking differences were found among the six areas; for example, underground residence times of basal waters in the Kalihi, Beretania and Moiliili systems are quite long in comparison to residence times of other systems. However, basal water in the Waialae system has a comparatively short residence time within the Honolulu systems. Many regions show the presence of transition-zone water, return irrigation water or caprock-type water, either singularly or in some combination. The study recommends preventive measures be taken to minimize the possible deterioration of Pearl Harbor basal water due to infiltration of manmade substances such as petroleum products or dangerous radioactive substances. The effect of agricultural activity on the chemical quality of Pearl Harbor basal water also needs further study. (Garrison-Omniplan)

DIEL PATTERNS OF ICHTHYOPLANKTON LENGTH-DENSITY RELATIONSHIPS IN UPPER WATTS BAR RESERVOIR, TENNESSEE,
Oak Ridge National Lab., TN. Environmental Sciences Div.
G. F. Cada, J. M. Loar, and K. D. Kumar.
In: Proceedings of the Fourth Annual Larval Fish Conference, February 27-28, 1980, Oxford, Mississippi, Fuiman, L. A., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/43, September, 1980, p 79-90. 4 Fig, 1 Tab, 9 Ref. W-7405-eng-26.

Descriptors: *Plankton, *Fish, *Larvae, *Sampling, Diel migration, Reservoirs, Fish populations, Fish behavior, Diurnal distribution, Vertical migration, Growth stages, Tennessee, Aquatic drift, Clupeids, *Bar Reservoir(TN).

Diel changes in drift rates bias the results of ichthyoplankton field studies which are restricted to day or night sampling, and these changes must be accounted for in investigations of fish populations or in assessment of water-use impacts. A diel ichthyoplankton sampling program was conducted in upper Watts Bar Reservoir, Tennessee, during 1978 to obtain information on diel changes in abundance of fish larvae in the planktonic drift and the extent of visually mediated sampling gear avoidance by motile larvae. Two-way analysis of variance tests revealed few significant diel differences in densities of individual taxa but showed consistently significant diel differences in mean total lengths of fish larvae. Clupeids in the 5 to 18 mm total length range were more abundant in surface samples during the day than during the night. Clupeid larvae either smaller or larger were relatively more abundant during the night. The greater nocturnal densities of larger larvae may be due to the inhibition of visual gear avoidance during the night. Although no direct evidence is available, diel vertical migration may also influence the observed patterns in size-specific, day-night density ratios. (Moore-SRC)

DETERMINATION OF THE VERTICAL DISTRIBUTION OF ICHTHYOPLANKTON IN LAKE NORMAN, NORTH CAROLINA, USING A DISCRETE-DEPTH SAMPLING DESIGN,
Duke Power Environmental Sciences Unit, Huntersville, NC.
R. E. Lewis, and J. R. Siler.
In: Proceedings of the Fourth Annual Larval Fish Conference, February 27-28, 1980, Oxford, Mississippi, Fuiman, L.A., Ed., Fish and Wildlife Service, Office of Biological Service, Report FWS/OBS-80/43, September, 1980, p 91-100. 3 Fig, 4 Tab, 9 Ref.

Descriptors: *Depth, *Sampling, *Larvae, *Fish, *Plankton, Spatial distribution, Lakes, Water temperature, Dissolved oxygen, North Carolina, Nuclear powerplants, Growth stages, Vertical distribution, Perches, Shad, Crappie, *Lake Norman(NC).

A vertical distribution study of larval shad, crappie, and percids in Lake Norman, North Carolina, was initiated in 1977 to: determine vertical distribution of ichthyoplankton in the vicinity of the McGuire Nuclear Station discharge during preoperational and operational periods; compare vertical distribution with water temperature, dissolved oxygen concentration, and total length of individuals in each taxon; and address the suitablity of a discrete depth sampling design in meeting these objectives. Vertical distribtuion varied with length of individuals in each taxon and water temperature, but dissolved oxygen concentration did not appear to influence the vertical distribution. The discrete-depth sampling design, using 2.5 m depth increments, was adequate for comparing vertical distribution of larval fishes with physical variables. Although a precise estimate of larval fish density for the complete water column was not possible, changes in vertical distribution of ichthyoplankton were detected. (Moore-SRC)
W81-00762

DIEL, VERTICAL AND HORIZONTAL VARIATIONS IN ABUNDANCE OF LARVAL DOROSOMA SPP. IN CENTER HILL RESERVOIR, TENNESSEE,
Tennessee Cooperative Fishery Research Unit, Cookeville.
M. J. Van Den Avyle, and D. D. Fox.
In: Proceedings of the Fourth Annual Larval Fish Conference, February 27-28, 1980, Oxford, Mississippi, Fuiman, L.A., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/43, September, 1980, p 116-122. 2 Fig, 2 Tab, 8 Ref.

Descriptors: *Distribution, *Larvae, *Fish behavior, *Fish, Tennessee, Spatial distribution, Temporal distribution, Shad, Sampling, Reservoirs, *Center Hill Reservoir(TN).

Knowledge of spatial and diel variations in abundance of larval fishes is important for understanding fish behavior and for developing efficient sampling programs. Larval Dorosoma species were collected at five depths from one midchannel station and from the surface at two inshore stations during May and June 1979. Collections were made six times during each of three 24 hour periods. Catches were highest at night and lowest at midday, and the larvae were always most abundant in the surface or 2 m samples. Diel variations are believed to result primarily from changes in catchability rather than vertical migrations. Midchannel densities were lower than shoreline or nearshore densities during two of the three sampling periods. Median lengths of shad larvae showed no consistent vertical or diel patterns, but specimens collected along the shoreline were usually shorter than those collected at the midchannel station. (Moore-SRC)

SEASONAL OCCURRENCE, DISTRIBUTION, AND POWER PLANT ENTRAINMENT OF LARVAL FISHES IN PRESQUE ISLE HARBOR, LAKE SUPERIOR,
Minnesota Univ., Minneapolis. Dept. of Ecology and Behavioral Biology.
J. T. Hatch.
In: Proceedings of the Fourth Annual Larval Fish Conference, February 27-28, 1980, Oxford, Mississippi, Fuiman, L.A., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/43, September, 1980, p 123-135. 4 Fig, 3 Tab, 24 Ref.

Descriptors: *Lake Superior, *Entrainment, *Fish, *Larvae, *Distribution, Michigan, Powerplants, Plankton, Seasonal, Temporal distribution, Spatial distribution, Fish reproduction, Fish behavior, Limnology, Sculpins, Cisco, Smelts, Lake trout, Suckers, Perches.

As part of a study to assess effects of expansion and operation of the Presque Isle Power Station, Marquette, Michigan, on the aquatic biota of Presque Isle Harbor, Lake Superior, ichthyoplankton were collected from April 1975 through July 1976. Larval fishes were found in the harbor during all months except September, October, and November. Larvae of most taxa appeared only between April and August, but coregonines and fourhorn sculpin occurred from December to July, and December to June, respectively. In 1976, coregonines and fourhorn sculpin reached peak abundance about mid-May, followed by rainbow smelt in late May, lake trout and white sucker in early June, yellow perch in mid-June, burbot in late June, sculpins of the genus Cottus in mid-July, and ninespine stickleback in late July. Larvae of most taxa exhibited clumped distributions during their respective periods of peak abundance. total entrainment from August 1975 through 1976 was estimated at 8,800,000 larvae. Rainbow smelt, coregonines, fourhorn sculpin, and lake trout accounted for 92.8%, 3.4%, 1.5%, and 1.2% of this estimate, respectively. Entrainment appeared to be associated with seasonal succession of larvae, behavioral characteristics of larvae, and physical factors such as river discharge, harbor circulation, and wave action. (Moore-SRC)

COPPER PHARMACOKINETICS IN FISH GILLS-II. BODY SIZE RELATIONSHIPS FOR ACCUMULATION AND TOLERANCE,
Concordia Univ., Montreal (Quebec). Dept. of Biological Sciences.
P. D. Anderson, and P. A. Spear.
Water Research, Vol 14, No 8, p 1107-1111, August, 1980. 2 Fig, 4 Tab, 25 Ref.

Descriptors: *Fish, *Copper, *Kinetics, *Lethal limit, Rainbow trout, Sunfish, Metals, Chemical analysis, Bioassay, Water quality.

Lethal tolerance levels to copper were determined for two species of fish: a warm-water species, pumpkinseed sunfish (Lepomis gibbosus), and a cold water species, rainbow trout (Salmo gairdneri). The LC50 for sunfish increased disproportionately with body weight and varied as the reciprocal of copper accumulation rate in the gills. Thus, smaller sunfish accumulated copper at a greater rate, receiving a larger dosage per unit body weight, and were less tolerant to copper. In contrast, the body weight of rainbow trout had no effect on the LC50 and the accumulation rate of copper. It is suggested that a causal relationship exists between the amount of copper accumulated in gills and the lethal tolerance to copper. A comparison is made between the results of this study and other findings published on lethal tolerance levels. (McKeon-FRC)

HETEROTROPHIC BACTERIA IN TWO CANADIAN RIVERS-I. SEASONAL VARIATIONS IN THE PREDOMINANT BACTERIAL POPULATIONS,
New Brunswick Univ., Fredericton. Microbiology Research Lab.
C. R. Bell, M. A. Holder-Franklin, and M. Franklin.
Water Research, Vol 14, No 5, p 449-460, May, 1980. 8 Fig, 7 Tab, 55 Ref.

Descriptors: *Rivers, *Populations, *Nutrients, *Seasonal, *Aquatic bacteria, Water quality, Canada, Eutrophication, Monitoring, Chlorophyll, Photosyntheses, Fluctuations, Pseudomonas, Nitrogen fixing bacteria, Ice cover, Oligotrophy, Aquatic populations, Surface waters, Dissolved oxygen, Hydrogen ion concentration, Conductance, Temperature.

The Dunbar River, a small pristine woodland tributary of the St. John River, was monitored for seasonal variations in heterotrophic bacteria and physico-chemical water quality parameters from February 1977 to February 1978. Samples were drawn for analysis every other week. Temperature and oxygen levels were determined on site, and all other water parameters were determined at the Water Quality Laboratory of Environment Canada in Moncton, New Brunswick. Results were compared with those obtained in similar studies on the Meduxnekeag River, an upstream tributary of the St. John River. Both the Meduxnekeag and the Dunbar appeared oligotrophic, although the former received effluents of domestic and industrial wastewaters. A toxometric approach coupled with multivariate statistical analysis of bacterial populations showed a predominance of fluorescent Pseudomonas spp. Bacterial populations were largely psychrotrophs, and their numbers were limited by nitrogen. Temperature had a strong influence on in situ heterotrophic activity. Both rivers had ice covers for 5 months, during which the dissimilation of nitrate was increased. (Geiger-FRC)

INTERACTING LIMITS TO ALGAL GROWTH: LIGHT, PHOSPHORUS, AND CARBON DIOXIDE AVAILABILITY,
Clarkson Coll. of Technology, Potsdam, NY. Dept. of Civil and Environmental Engineering.
T. C. Young, and D. L. King.
Water Research, Vol 14, No 5, p 409-412, May, 1980. 3 Fig, 27 Ref.

Descriptors: *Eutrophication, *Aquatic algae, *Nutrients, *Limiting factors, Environmental effects, Plant growth, Light intensity, Phosphorus, Carbon dioxide, Nuisance algae.

New information regarding the interactions between some commonly recognized factors which limit algal growth is discussed with a view to adding to knowledge of the mechanisms of eutrophication and to contributing to the development of strategies to control its adverse impacts. Some of these factors include light, phosphorus, and carbon dioxide availability. A cyanophyte, Anacystis nidulans, was grown under conditions which gave a range of growth limitation for each of these factors. The effects of the three limiting factors on algal growth were readily apparent and demonstrate the existence of a positive interaction between light, phosphorus and carbon dioxide as regulators of algal carbon fixation. Algae incubated at high light with ample phosphorus grew faster over a wider range of carbon dioxide concentrations and a lower concentration of carbon dioxide than did algae grown under other conditions. Algae incubated at low light with only limited phosphorus grew at a lower rate over a narrower range of concentrations of carbon dioxide, and ceased growth at a higher concentration of carbon dioxide compared to other conditions. An initial dependence on the amount of illumination was noted in each study. The results suggest that interactions between limiting factors can be important in determining the rate and amount of algal growth in freshwater ecosystems. (Baker-FRC)
W81-00777

ACUTE TOXICITY AND BEHAVIORAL RESPONSES OF COHO SALMON (ONCORHYNCHUS KISUTCH) AND SHINER PERCH (CYMATOGASTER AGGREGATA) TO CHLORINE IN HEATED SEA-WATER.
Washington Univ., Seattle. Fisheries Research Inst.
Q. J. Stober, P. A. Dinnel, E. F. Hurlburt, and D. H. DiJulio.
Water Research, Vol 14, No 4, p 347-354, April, 1980. 5 Fig, 3 Tab, 3 Ref.

Descriptors: *Coho salmon, *Shiner perch, *Chlorine, *Thermal waters, Fish, Fish attractants, Fish behavior, Fish repellents, Toxicity, Bioassay, Effluents, Statistics, Sea water, Heated water.

The acute toxicity and behavioral responses of 1-yr-old coho salmon and 1-3-mo-old shiner perch to chlorinated sea-water at 13, 16, and 20C were determined. Both species were exposed to chlorine concentrations of 0.077-1.035 mg/liter, as measured by total residual oxidant (TRO), for 7.5, 15, 30, and 60 min. Shiner perch did not survive exposures exceeding 1.0 mg/liter TRO for 7.5 min. All survived a 60 min exposure at TRO concentrations of < 0.2 mg/liter. Coho salmon did not survive an exposure of 7.5 min at 0.5 mg/liter TRO or more. A survival of 100% after 60 min was observed at TRO concentrations of < 0.1 mg/liter. The mean 60 min LC50 for shiner perch was significantly reduced ($P < or = 0.05$), from 308 microg/liter TRO at 13C to 230 microg/liter at 20C. The 60 min LC50 for coho salmon decreased from 208 microg/liter TRO at 13C to 130 microg/liter at 20C. Coho salmon consistently avoided chlorine at all test concentrations from 2 to 500 microg/liter. Increased temperatures reinforced this response. A significant avoidance threshold was observed for shiner perch at 175 microg/liter TRO, while a significant preference response occurred at concentrations of from 10 to 100 microg/liter at 16 and 20C. This study indicates that the discharge of chlorinated effluents into sea-water may be attractive to some resident marine populations. (McKeon-FRC)
W81-00786

A PRESSURIZED PROPORTIONAL DILUTER FOR AQUATIC TOXICOLOGICAL STUDIES,
Environmental Protection Agency, Gulf Breeze, FL. Gulf Breeze Environmental Research Lab.
M. J. Hemmer.
Water Research, Vol 14, No 3, p 243-246, March, 1980. 3 Fig, 1 Tab, 6 Ref.

Descriptors: *Equipment, *Siphon, *Testing procedures, Analytical techniques, *Toxcity, Chlorinated hydrocarbon pestcides, Pumps, Carbamate pesticides, Pesticide toxicity, Laboratory tests, Sampling, Aquatic animals, Water pollution effects.

A proportional diluter which was recommended for use in routine aquatic toxicity tests by the committee on Methods for Toxicity Test With Aquatic Organisms (1975) is described. The half-liter proportional diluter uses positive pressure, with its primary siphons being activated by a pulse of pressure instead of by a partial vacuum as in conventional diluters. The need for venturi tubes, vacuum manifolds, and individual water blocks is eliminated by the device. Pressure is delivered through air cylinders, air compressor lines or air pumps. Performance evaluations of the diluter were conducted in 96-hour acute toxicity tests to the grass shrimp, Palaemonetes pugio, exposed to the organochlorine pesticide, endrin, or the carbamate pesticide, sevin. Recoveries of the pesticides from seawater samples wer greater than 90%. Other advantages of the proportional diluter include its ease of construction, calibration and cleaning, its low cost, compact size, and albility to conserve water. (Geiger-FRC)
W81-00795

A COMPARISON OF THE INFLUENCE OF IRON ON THE GROWTH AND NITRATE METABOLISM OF ANABAENA AND SCENEDESMUS,
State Univ. of New York at Fredonia.
D. R. Verstreate, T. A. Storch, and V. L. Dunham.
Physiologia Plantarum, Vol 50, p 47-51, 1980. 2 Fig, 4 Tab, 20 Ref. OWRT-B-074-NY(1), 14-34-0001-8102.

Descriptors: *Iron, Effects, *Growth rates, *Algae, *Cyanophyta, *Chlorophyta, Nitrate assimilation, Glutamine synthetase, Anabaena flos-aquae, Scenedesmus bijugatus.

A comparative study of growth and nitrate metabolism of Anabaena flosaquae (Lyng.) Breb, and Scenedesmus bijugatus var. seriatus Chodat investigated possible mechanisms for the iron-stimulated increases in growth specific for blue-green algae in mixed algal communities. Algae were separately grown in an inorganic medium with varying concentrations of iron and nitrate to determine the effects on each organism. Iron was found to be a limiting nutrient for cultures of both Anabaena and Scenedesmus as determined by chlorophyll a concentrations and cell enumeration. Both iron and nitrate stimulated the specific activity of nitrate reductase, nitrite reductase, and glutamine synthetase in Anabaena. Iron enrichment did not increase the activity of the enzymes in Scenedesmus, but inhibited the activity of nitrate reductase and glutamine synthetase. The stimulation of growth by iron in cells grown under iron limiting conditions was associated with increased nitrate metabolism in Anabaena but not in Scenedesmus.

ROLE OF THE U.S. FISH AND WILDLIFE SERVICE IN PUMPED STORAGE POWER PLANT PROJECTS,
National Power Plant Team, Ann Arbor, MI.
J. Boreman.
In: Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations, May 15-16, 1979, Clemson, South Carolina, Clugston, J.P., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/28, April, 1980, p 4-11. 4 Tab.

Descriptors: *Pumped storage, *Hydroelectric plants, *Environmental effects, *Wildlife, Water quality, Aquatic life, Streamflow, Methodology, Decision making, Permits, Information exchange, Fish, Habitats, Migration, Fish and Wildlife Service.

The construction and operation of pumped storage projects pose a threat to the well-being of the fish and wildlife resources of the United States. This threat results from potential environmental impacts such as entrainment and impingement of aquatic organisms, degradation of water quality, alteration of natural stream flows, removal of terrestrial habitat, and interference with migration pathways. The U.S. Fish and Wildlife Service is currently involved with pumped storage projects in two areas: review of license and permit applications, and research and development of information that can be used to minimize project impacts. To increase the effectiveness of this involvement, in the future the Fish and Wildlife Service will emphasize three areas of effort: development of an environmental information base, timely dissemination of information and methodologies to decision makers, and evaluation of the usefulness of the disseminated information and methodologies. Descriptors: *Pumped storage, *Hydroelectric plants, *Water temperature, *Reservoirs, Thermal stratification, Hydraulic structures, Weirs, Dams, Reservoir design, Trout, South Carolina, Nuclear powerplants, Aquatic habitats, Environmental effects, *Keowee-Toxaway Project(SC).

The Keowee-Toxaway Project is located in the foothills and mountains of northwestern South Carolina. The project consists of a system of impoundments and power facilities including Keowee and Jocassee Reservoirs, the three-unit Oconee Nuclear Station, a conventional hydroelectric station at the Keowee dam, and a pumped storage hydroelectric station at the Jocassee dam. Each impoundment and power facility is briefly described. Representative water temperature profiles, both preoperational and operational, are given for each impoundment that indicate the general effects of project operations on thermal conditions. The design of these power plants includes a skimmer wall and submerged weirs that result in selective use of reservoir water for different functions. In Keowee Reservoir during summer the lower strata are warmed noticeably above preoperation conditions, and during winter temperatures cool to within a few degrees of the preoperation condition. The effect of pumped storage operations has been to lower the upper boundary of suitable trout habitat in Jocassee Reservoir. An additional pumped storage station, Bad Creek, is scheduled for construction above Jocassee Reservoir. In order to reduce the probability that the flows from the Bad Creek station will erode the trout habitat in Jocassee Reservoir through destratification, a submerged weir will be placed downstream of the discharge. PREDICTIONS OF EFFECTS OF PUMPED STORAGE HYDROELECTRIC OPERATIONS ON TROUT HABITAT IN JOCASSEE RESERVOIR, SOUTH CAROLINA,
Fish and Wildlife Service, Clemson, SC. Southeast Reservoir Investigations.
J. L. Oliver, and P. L. Hudson.

In: Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations, May 15-16, 1979, Clemson, South Carolina, Clugston, J.P., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/28, April, 1980, p 21-25. 2 Tab, 6 Ref.

Descriptors: *Pumped storage, *Hydroelectric plants, *Trout, *Water temperature, Reservoirs, Aquatic habitats, Dissolved oxygen, Winter, Thermal stratification, South Carolina, Turnovers, Forecasting, Environmental effects, *Jocassee Reservoir(SC).

Jocassee Reservoir is the upper pool for the Jocassee Pumped Storage Station. Keowee Reservoir serves as the lower pool and as a cooling reservoir for the Oconee Nuclear Station. Although Jocassee reservoir supports an excellent fishery for both trout and warmwater species, increased operation of the power stations has resulted in a continual decline in the volume of trout habitat from 1973 to 1976. Temperature and dissolved oxygen profiles were taken monthly at three stations in Jocassee Reservoir since August 1973 and at one station in the tailwaters since April 1972. Two regression equations describing the effect of pumped storage operations were developed: both estimate the volume of trout habitat during the most critical period of the summer, before fall overturn. Various combinations of minimum winter water temperature (MWWT) and pumping volumes were used to predict September trout habitat. On the basis of estimated 1985 and 1991 pumping volumes it is estimated that trout habitat will be present in those years after cold winters, but that it may be nearly or completely eliminated after a typical or warm winter. ENTRAINMENT OF ICHTHYOPLANKTON AT JOCASSEE PUMPED STORAGE STATION,
Fish and Wildlife Service, Clemson, SC. Southeast Reservoir Investigations.
E. D. Prince, and L. J. Mengel.
In: Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations, May 15-16, 1979, Clemson, South Carolina, Clugston, J. P., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/28, April, 1980, p 26-39. 3 Fig, 2 Tab, 20 Ref.

Descriptors: *Pumped storage, *Hydroelectric plants, *Entrainment, *Larvae, *Fish, Reservoir operation effects, South Carolina, Mortality, Penstocks, Reservoirs, Diel migration, Ecology, Jocassee pumped storage station(SC).

The entrainment of larval fish at Jocassee pumped Storage Station, South Carolina, has been studied since April 1977 to evaluate the effects of power plant operations on fish populations. Duplicate weekly samples of fish larvae were taken in 1977 during generation and pumping using plankton nets. A frame trawl has been used to sample larval fish throughout the upper and lower reservoirs and to assess diel depth distribution at both ends of the penstocks. About six times more larvel fish were entrained during pumping than during generation in 1977. The differences in the densities of larvel fish passing through the pumped storage station during different modes of operation appear to be related to three major factors: configuration of the basin surrounding the penstock openings; diel depth distribution of the fish larvae; and times of day during which the plant operated. About 7% of the larval clupeids in Keowee Reservoir were killed due to operation of the pumping mode in 1977. (Moore-SRC)

REVIEW OF THE LITERATURE ON THE EFFECTS OF PUMPED STORAGE OPERATIONS ON ICHTHYOFAUNA,
Georgia Power Co., Atlanta.
R. D. Miracle, and J. A. Gardner, Jr.
In: Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations, May 15-16, 1979, Clemson, South Carolina, Clugston, J.P., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/28, April, 1980, p 40-53. 71 Ref.

Descriptors: *Pumped storage, *Hydroelectric plants, *Fish, *Mortality, Reservoir operation effects, Ecology, Aquatic habitats, Water temperature, Dissolved oxygen, Velocity, Water levels, Reservoirs, Entrainment, Animal pathology, Pressure, Growth stages.

Pumped storage operations pass large volumes of water from one reservoir to another, ultimately affecting fishes, either by entrainment in withdrawn waters or by modification of the aquatic environment. Mortality caused during entrainment is primarily due to the following physical stresses: abrasion and collision; pressure changes; velocity changes; and acceleration effects. Fish passage or entrainment is influenced by: size and life stage of fish; susceptibility of the fish which directly relates to life history aspects; and physical characteristics of the pumped storage facility. Pumped storage facilities can adversely affect reservoir hydrology through changes in water level, water temperature, dissolved oxygen and water velocity. Although adverse effects of pumped storage can be severe when drastic modifications result from plant operations, most fish populations are able to adapt to the changing environments encountered at facilities in the United States. STUDIES OF THE EFFECTS OF OPERATING THE MT. ELBERT PUMPED STORAGE POWERPLANT,
Water and Power Resources Service, Denver, CO. Engineering and Research Center.
J. F. LaBounty, and R. A. Roline.
In: Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations, May 15-16, 1979, Clemson, South Carolina, Clugston, J. P., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80-28, April, 1980, p 54-66. 3 Fig, 1 Tab, 38 Ref.

Descriptors: *Pumped storage, *Hydroelectric plants, *Aquatic habitats, Reservoir operation effects, Ecology, Mortality, Aquatic life, Limnology, Fish, Shrimp, Sampling, Lake sediments, Ecosystems, Colorado, *Twin Lakes(CO).

The Mt. Elbert Pumped Storage Powerplant is located on the northwest shore of the lower lake of Twin Lakes near Leadville, Colorado. Construction of the powerplant started in February 1972, and initial operation of the first of two units is planned for 1981. In 1971, the Water and Power Resources Service initiated studies to obtain limnological and fishery data in an attempt to better understand the environmental impacts of pumped storage. Past, ongoing, and planned research on the Twin Lakes ecosystem is reviewed. Expected impacts resulting from powerplant operation include fish and mysis shrimp mortality, stirring of lake sediments, and changes in the physical environment of Twin Lakes. To assess and quantify the impacts of pumped storage on Twin Lakes biota, sampling facilities in the tailrace of the lower lake and in the Mt. Elbert forebay are being designed and constructed. These structures and techniques will allow sampling of aquatic organisms at any time during the pumping and generation modes of the powerplant. (Moore-SRC)

PREOPERATIONAL FISHERY INVESTIGATIONS OF TWIN LAKES, COLORADO,
Colorado Div. of Wildlife, Buena Vista.
T. P. Nesler.
In: Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations, May 15-16, 1979, Clemson, South Carolina, Clugston, J.P., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/28, April, 1980, p 67-79. 6 Fig, 3 Tab, 8 Ref.

Descriptors: *Pumped storage, *Sport fishing, *Rainbow trout, *Lake trout, Creel census, Baseline studies, Fish populations, Reservoirs, Ice fishing, Lake fisheries, Sampling, Colorado, *Twin Lakes(CO).

Twin Lakes, near Leadville, Colorado, is the first of Colorado's reservoirs to be developed as a pumped storage site. The fishery at Twin Lakes can be classified into two major components: stocked rainbow trout fishery during the open-water season, and lake trout during the ice fishing season. Because of the potential impact of pumped storage operations on the sport-fishing harvest, a creel census and a standardized program of gillnet sampling were initiated in 1973. Annual harvests of rainbow trout for both lakes during the open-water season ranged from over 25,000 to 43,000 during 1974-1977, and over 81,000 in 1973. Lake trout harvested in 1974-1977 ranged from 1,000 to 1,500 fish. Fishermen-hours on the lower lake were approximately 2-3 times greater than estimates for the upper lake. On the lower lake, the catch rate for shore fishermen ranged from 0.25-0.44 fish per man-hour, and for boat fisherman ranged from 0.17-0.27 fish man-hour. With the exception of one season, ice fishing catch rates ranged from 0.11-0.14 fish per man-hour and lake trout composed 89% or more of the total harvest. (Moore-SRC)

SUMMARY OF ECOLOGICAL STUDIES OF FISHES IN MUDDY RUN PUMPED STORAGE POND, PENNSYLVANIA,
Radiation Management Corp., Drumore, PA.
P. G. Heisey, and D. Mathur
In: Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations, May 15-16, 1979, Clemson, South Carolina, Clugston, J.P., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/28, April, 1980, p 80-94. 2 Fig, 5 Tab, 11 Ref.

Descriptors: *Pumped storage, *Hydroelectric plants, *Fish populations, *Ecology, Reservoirs, Fish reproduction, Mortality, Entrainment, Pennsylvania, Muddy Run pumped storage pond(PA), Conowingo Pond(PA)

Muddy Run Pumped Storage Pond and Conowingo Pond are located in southeastern Pennsylvania. Most water for Muddy Run is drawn form Conowingo. Most of the fish species inhabiting the lower pond (Conowingo) were entrained by the Muddy Run Station soon after it commenced operation; however, fish entrainment and mortality at Muddy Run Station had little impact on fish populations in Conowingo. Variations in abundance of many common fishes in Conowingo appear to depend upon success or failure of individual year classes and not on operation of Muddy Run Station. Total standing crop of fishes in Muddy Run compares favorably with that from numerous non-pumped storage reservoirs except for sunfishes and crappies. Data collected in recent years indicate that a more favorable game fish to rough fish ratio is developing in Muddy Run. Reproductive success of most fishes in Muddy Run was limited by water level fluctuations. Numerous fish appear to be recruited from a constant elevation lake set aside for recreation (Moore-SRC)

WATER QUALITY AT THE TVA RACCOON MOUNTAIN PUMPED STORAGE PLANT,
Tennessee Valley Authority, Chattanooga. Div. of Water Resources.
H. Olem, and L. H. Woosley, Jr
In: Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations, May 15-16, 1979, Clemson, South Carolina, Clugston, J.P., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/28, April, 1980, p 95-108. 9 Fig, 4 Ref.

Descriptors: *Pumped storage, *Hydroelectric plants, *Dissolved oxygen, *Reservoirs, Stratification, *Water quality, Hydrogen ion concentration, Aquatic productivity, Diurnal, Tennessee, *Raccoon Mountain pumped storage plant(TN)

The Raccoon Mountain Pumped Storage Plant, just west of Chattanooga, Tennessee, has been providing peaking and reserve capacity requirements to the Tennessee Valley Authority power system since 1978. Because of the potential for low concentrations of dissolved oxygen in releases from the upper reservoir having a significant impact on the water quality of the lower reservoir, Nickajack Lake, the water quality in the upper reservoir and in reservoir releases is investigated. Operation of the Raccoon Mountain Plant on a routine basis did not result in releases of water containing dissolved oxygen concentrations below 4.0 mg/l. When water released from the upper reservoir was below 5.0 mg/l, the calculated decrease in dissolved oxygen in Nickajack Lake after mixing was less than 5%. The newly formed upper reservoir exhibited dissolved oxygen stratification in the upper layer during routine summer operation in 1979 due to a biologically productive surface layer. Dissolved oxygen concentrations between 8.9 and 11.4 mg/l were measured in the upper three meters. Diurnal fluctuations of pH and dissolved oxygen in the upper layer of the upper reservoir were observed during routine summer operation. (Moore-SRC).

EFFECTS OF PUMPBACK STORAGE ON ZOOPLANKTON POPULATIONS,
Virginia Polytechnic Inst. and State Univ., Blacksburg, VA.
A. L. Buikema, Jr., and P. H. Loeffelman.
In: Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations, May 15-16, 1979, Clemson, South Carolina, Clugston, J.P., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/28, April, 1980, p 109-124. 10 Fig, 22 Ref.

Descriptors: *Pumped storage, *Hydroelectric plants, *Thermal statification, *Zooplankton, Virginia, Water temperature, Crustaceans, Rotifers, Aquatic animals, Limnology, Predation, *Smith Mountain Lake(VA).

The impact of pumped storage operations on the aquatic mirofauna of impoundments was investigated at Smith Mountain Lake, a mainstream pumped storage complex southeast of Roanoke, Virginia. Smith Mountain Lake was sampled for zooplankton and water temperature at four stations once a month for 13 months and then at two stations once a day for seven days. The most obvious effect of pumpback on temperature was disruption of thermal stratification in the forebay. Thermal layers fluctuated greatly, and isolated lenses of water of differing temperature were apparent. A total of 1088 pump samples and 104 tow samples were qualitatively and quantitatively analyzed for zooplankton. Forty-nine species of rotifers, 15 species of Cladocera, and 8 species of copepods were identified. It appears that the interaction of pumped storage operation and zooplankton populations in Smith Mountain Lake is very complex. Pumpback appears to stimulate predation, and normal thermal characteristics of the lake were altered to the apparent benefit of the zooplankton. (Moore-SRC)

A MATHEMATICAL MODEL TO ASSESS THE EFFECTS OF PASSAGE OF ZOOPLANKTON ON THEIR RESPECTIVE POPULATIONS,
Stone and Webster Engineering Corp., Boston, MA.
T. J. Horst.
In: Proceedings of the Clemson Workshop on Environmental Impacts of Pumed Storage Hydroelectric Operations, May 15-16, 1979, Clemson, South Carolina, Clugston, J.P., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/28, April, 1980, p 177-189. 9 Fig, 3 Tab, 7 Ref.

Descriptors: *Pumped storage, *Hydroelectric plants, *Mathematical models, *Zooplankton, *Mortality, Limnology, Aquatic animals, Entrainment, Crustaceans, Sweden, *Lake Ivosjon(Sweden).

A mathematical model is used to study the operational effects of the proposed Vastana pumped storage plant on the Lake Ivosjon, Sweden, ecosystem by assessing the effects of withdrawal and discharge of water on zooplankton. Bosmina coregoni was selected as representative of zooplankton with a relatively rapid development time and Eudiaptomus graciloides was selected as the representative of long-lived zooplankton. A series of simulations was conducted to assess the effects of power plant operation on the populations of the zooplankters. Mortality values of 10%, 50%, and 100% were used for entrainment mortality. The percent reduction in the Bosmina population was 2% for the low entrainment mortality, and 8 to 12% for the assumption of total mortality of entrained organisms. The percent reduction in the Eudiaptomus population was 2% for the low entrainment mortality and 9 to 16% for the assumption of total entrainment mortality. Except for the most extreme cases simulated, the predictions fall within the range of measured variation. Based on this study, the proposed Vastana plant is expected to have a tolerable effect on the lake ecosystem. (Moore-SRC)

TOXIC SUBSTANCES FROM FRESHWATER ALGAE,
Alberta Univ., Edmonton. Dept. of Botany.
P. R. Gorham, and W. W. Carmichael.
Progress in Water Technology, Vol 12, No 2, p 189-198, 1980. 1 Fig, 3 Tab, 36 Ref.

Descriptors: *Cyanophyta, *Eutrophication, *Algal toxins, *Scum, *Poisons, Toxicity, Freshwater, Animal groupings, Chemicals, Chemical properties.

Toxins isolated from strains of freshwater planktonic blue-green algae are discussed including their structure and toxicity. Known Microcystis toxins are either a fast-acting/low-molecular weight alkaloid or a slow-acting, comparatively small polypeptide. Toxins isolated from Anabaena and Aphanizomenon strains are fast-acting, low-molecular weight alkaloids. Recent research has identified toxins from Anabaena and Microcystis that are different from ones studied earlier. A pteridine toxin has been isolated from a strain of Synechococcus. Poisoning by freshwater blue-green algae is now better understood because of these findings. To cause poisoning, a waterbloom or scum must have a relative proportion of one or more toxic strains that equals or exceeds a poisonous threshold value and maintain this composition of species for a period of time. The threshold will differ with the species and strains of toxic algae involved, the amounts ingested, and the target animals. Achieving and maintaining toxic levels depends on growth conditions, phytoplankton and zooplankton, decomposition and detoxification mechanisms, lysis, agglomeration, and others. (Small-FRC)

THE SIGNIFICANCE OF THE PREDATOR FOOD CHAIN IN LAKE METABOLISM,
Trondheim Univ. (Norway). Zoological Dept.
A. Langeland, and P. Larsson.
Progress in Water Technology, Vol 12, No 2, p 181-187, 1980. 1 Fig, 29 Ref.

Descriptors: *Zooplankton, *Eutrophication, *Fish populations, *Predation, *Lakes, Biological communities, Primary productivity, Phytoplankton, Cyanophyta, Europe, Food chains.

Selective fishing as a biological tool in the control of eutrophication of lakes is discussed. Field studies are cited to demonstrate the significance of the predator food chain in lakes. Increased self-purification has been reported in serveral limnetic water bodies when large filter feeding cladocerans were allowed to increase their populations. Fish predation reduces the size of zooplankton populations, causing less efficient grazing on phytoplankton. In most cases when large cladoceran populations develop, the general phytoplankton biomass is reduced. There is also usually a reduction in the amount of blue green algae. An additional positive factor is that the fish may be harvested and serve as a food for man. (Small-FRC)

EFFECTS OF EUTROPHICATION ON ZOOPLANKTON,
Commission of the European Communities, Ispra (Italy). Phsyical and Natural Sciences Dept.
O. Ravera.
Progress in Water Technology, Vol 12, No 2, p 141-159, 1980. 1 Fig, 3 Tab, 61 Ref.

Descriptors: *Zooplankton, *Eutrophication, *Methodology, *On-site investigations, Lake stages, Nutrients, Water pollution effects, Industrial wastes, Predation, Cladocerans, Reviews.

A review is presented of the methodologic difficulties and the uncertainty in interpreting results of studies on the variation of zooplankton with eutrophication. Two methods are normally used: a comparison of characteristics of zooplankton within the same body of water as eutrophication levels change, and comparison of zooplankton in different bodies of water with different levels of trophy. Zooplankton samples are collected from sediment cores, and Cladocerans are usually studied. The influence of phytoplankton, the effects of predation, and the succession of species are discussed. Because of the combined influences of nutrient enrichment, industrial pollution, and the introduction of planktivore fish on zooplankton communities, it can be difficult to determine the effects of eutrophication. The most successful studies apply different methods to the same body of water to obtain a more complete picture of zooplankton changes. (Small-FRC)

THE INFLUENCE OF EUTROPHICATION ON DEEP LAKE BENTHIC INVERTEBRATE COMMUNITIES,
Bergen Univ. (Norway). Zoological Museum.
O. A. Saether.
Progress in Water Technology, Vol 12, No 2, p 161-180, 1980. 8 Fig, 1 Tab, 53 Ref.

Descriptors: *Zooplankton, *Eutrophication, *Lakes, *Succession, Biological communities, Great lakes, Phosphorus, Lake stages, Europe, Water pollution effects, Oligochaetes, Chironomids.

Case histories are presented of eutrophication in the following deep lakes: Vattern, Malaren, Constance, Geneva, Maggiore, Mergazzo, Taho, the Great Lakes, and the Okanagan Lakes. In most of these lakes the first reaction to eutrophication was an increase in abolute and relative amounts of oligochaetes without any change in species composition. Shaeriids, large crustaceans, and chironomids also increased in number. Further, there is a shift in relative abundance of common species. When a strongly oligotrophic lake changes to a less strongly oligotrophic lake, only species of chironomids may be eliminated from the profundal zone. A study of characteristic chironomids in lakes of different trophic levels indicated 15 subdivisions of communities. A significant correlation was found between the 15 subdivisions and chlorophyll a/mean depth and between subdivisions and total phosphorus/mean depth. These correlations indicate that while it is easy to change benthic communities from ultraoligothrophic to moderately oligotrophic, it takes higher shifts in primary production to change oligotrophic to mesotrophic or mesotrophic to eutrophic. More primary production is needed to change the benthic communities as the depth of the lake increases. (Small-FRC)

BLUE-GREEN ALGAE IN LAKE MJOSA AND OTHER NORWEGIAN LAKES,
Norsk Inst. for Vannforskning, Oslo.
O. M. Skulberg.
Progress in Water Technology, Vol, 12, No 2, p 121-140, 1980. 13 Fig, 1 Tab, 35 Ref.

Descriptors: *Eutrophication, *Lakes, *Nutrients, *Algal control, Algae, Water quality, Aquatic environment, Water properties, Phosphorus, Water pollution, Lake Mjosa, Norway.

Various lakes in Norway were investigated to determine increases in blue-green algae resulting from human activities that have changed the oligotrophic conditions of the waters. These activities include waste disposal and agriculturally related pollution. The trophic nature of inland waters is closely linked with the growth of planktonic algae. Evidence of trophic changes in algal growth includes variations in the major components of phytoplankton, studied from May through November of 1976. In some regions of Norway, eutrophication has been associated with invasions of planktonic species of Oscillatoria which are able to develop dense populations in lakes and slow flowing rivers. Climatic conditions also influence phytoplankton development. It is concluded from current research that an invasion of blue-green algae occurs under disturbed ecological conditions. Eutrophication provides a sequence of events leading to mass development of vegetation with blue-green algae. Eutrophication is a continuous and coherent phenomenon, and thus control measures must concentrate on local reservoirs of the blue-green algae. (Baker-FRC)

THE CASE OF LAKE MJOSA,
Norsk Inst. for Vannforskning, Oslo.
H. Holtan.
Progress in Water Technology, Vol 12, No 2, p 103-120, 1980. 13 Fig, 4 Tab, 45 Ref.

Descriptors: *Eutrophication, *Lakes, *Nutrients, *Algal control, Water qulaity, Aquatic environment, Water properties, Phosphorus, Nitrogen, Algae, Lake Mjosa, Norway.

Lake Mjosa is located 121 m above sea level and has a surface area of 365 square km, an average water depth of 153 m, maximum depth of 447 m, and a volume of about 56 cubic km. The lake with several tributary valleys extends far into Norway's largest mountain area, Jotunheimen. The total phosphorus supplied to the lake in tons per year for 1973 through 1977 ranged from 396.8 to 218.9 tons. Samples were taken from the lake four times a year from 1966 to 1974 to perform eutrophication studies. Eutrophication is occurring as a result of continuously increasing supplies of nutrients and other growth stimulating substances entering the lake. The phosphourus load is not the only problem. Increasing supplies of nitrogen and nitrate have also been noted. The phytoplankton biomass in general has consisted of diatoms, but in the latter part of 1976 summer season the blue-green alga Oscillatoria bornetii fa. tenuis became dominant. A plan has been drawn up for restoration of the water and is described. (Baker-FRC)

EUTROPHICATION OF ALPINE LAKES,
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung Und Gewaesserschutz, Zurich (Switzerland).
H. Ambuhl.
Progress in Water Technology, Vol 12, No 2, p 89-101, 1980. 8 Fig, 2 Tab, 1 Ref.

Descriptors: *Eutrophication, *Lakes, *Nutrients, Water quality, Limnology, Aquatic environment, Water properties, Oxygen, Phosphorus, Alpine lakes, Switzerland.

Eutrophication is discussed as it occurs in alpine lakes which are strongly influenced by their mountainous surroundings, many being relatively deep, quite steep walled, and in certain cases even typical of fjord lakes with partly tectonic origin. Phosphorus plays the major role in determining the extent of photosynthesis in lakes. The load of phosphate which leads to eutrophication depends on various parameters including local climate, wind exposure, morphometry, retention time and others. Some general comments on phosphorus loading of alpine lakes are given. It is noted that the existence of dissolved oxygen in the near-bottom water does not necessarily exclude the possiblity of phosphorus release from the sediment into the waterbody, which thus leads to self-fertilization of the lake. Morphometric and hydrographic data are given for several lakes. The vertical distribution of the oxygen content in Swiss lakes at the end of the summer stagnation for 1965-1975 is graphed. The possibility of restoration of small and hallow lakes by lowering phosphorus load and by internal lake measures such as aeration, hypolimnion drainage and others is considered. (Baker-FRC)

APPLICATION OF US OECD EUTROPHICATION STUDY RESULTS TO DEEP LAKES,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
R. A. Jones, and G. F. Lee.
Progress in Water Technology, Vol 12, No 2, p 81-88, 1980. 4 Fig, 1 Tab, 6 Ref.

Descriptors: *Eutrophication, *Lakes, *Model studies, Aquatic environment, Water properties, Algal control, Algae, US OECD eutrophication model, Norway, Lake Mjosa.

The US portion of the OECD eutrophication study was recently completed and applied to a deep Norwegian lake, Lake Mjosa. This portion of the OECD nutrient load-eutrophication response model demonstrated that the Vollenweider approach of using phosphorus load normalized by mean depth and hydraulic residence time to predict the planktonic algal chlorophyll in the waterbody is valid for a wide variety of waterbodies. This particular lake shows the same normalized phosphorus load-planktonic algal chlorophyll relationships. It is concluded that the OECD eutrophication modeling approach and the nutrient load-eutrophication response relationships developed by Vollenweider and expanded by the US together present a powerful tool to assess the impact of eutrophication control programs. Water quality managers will be able to predict with a high degree of reliability the changes in water quality that will occur as a result of reducing the phosphorus input to a waterbody by a certain magnitude. (Baker-FRC).

EUTROPHICATION OF NORWEGIAN FRESHWATERS IN RELATION TO NATURAL CONDITIONS,
Oslo Univ. (Norway).
J. Kjensmo.
Progress in Water Technology, Vol 12, No 2, p 39-47, 1980. 4 Tab, 17 Ref.

Descriptors: *Eutrophication, *Phosphorus, *Glacial soils, Bedrock, Soil chemistry, Soil structure, Soil types, Rocks, Glacial sediments, *Norway, Lakes, Rivers.

The natural supply of phosphorus to Norwegian fresh water is considered. The most important natural source for phosphorus supply is the rocks and soils in the drainage areas of lakes and rivers. The bulk of phosphorus in rock is in the form of apatite. Surface soil layers are often rich in phosphorus due to the plant detritus in various stages of decomposition. Total phosphorus levels in 14 Norwegian lakes were determined. The range is from 3.8 to 5.8 micrograms/liter in a group of Permian lakes. Two humic influenced lakes which are situated in Pre-Eocambrian and Eocambrain rocks have total P contents of 8.8 and 10.3 micrograms/liter, respectively. The export of total P from the watersheds of some Norwegian rivers ranges from 4.0 to 57.3 mg/sq m/year. The annual average export derived from 7 watersheds which consist mainly of forested and unproductive igneous areas was found to be 7.2 mg/sq m/year. The findings in rivers and lakes studied demonstrate the large scale of natural oligotrophic features in the watersheds of Norway. (Baker-FRC)

COMBINED EFFECTS OF DODECYL BENZENE SULFONATE AND LOW SALINITIES ON TISBE BULBISETOSA (COPEPODA: HARPACTICOIDA),
National Research Council, Venice (Italy). Inst. of Marine Biology.
L. Dalla Venezia, V. U. Fossato, and S. Scarfi.
Progress in Water Technology, Vol 12, No 1, p 109-117, 1980. 3 Fig, 2 Tab, 9 Ref.

Descriptors: *Toxicity, *Laboratory tests, *Alkylbenzene sulfonates, *Salinity, Water pollution, Water pollution effects, Sea water, Invertebrates, Tisbe bulbisetosa.

Laboratory experiments analyzed the effects of four concentrations of dodecyl benzene sulfonate (DBS), a component of commercial detergents, at four salinity levels on adult Tisbe bulbisetosa. The methylene method of anlysis was used to control stability of DBS over time. The effective concentration of DBS decreased within two weeks after preparation of solutions. This decrease seemed to be dependent on the initial concentration and the salinity level. The noxiousness of detergents decreased as salinity increased. The two-day LC50 of DBS in sea water with 36% salinity was 5.12 ppm. This is higher than expected, indicating that the other components of domestic detergents are toxic and that all the components together may have a synergistic effect. (Small-FRC)

EFFECT OF LEAD SPECIATION ON TOXICITY,
Clemson Univ., SC. Dept. of Zoology.
M. L. Freedman, P. M. Cunningham, J. E. Schindler, and M. J. Zimmerman
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 3, p 389-393, May-June, 1980. 1 Fig, 3 Tab, 13 Ref.

Descriptors: *Phosphates, *Speciation, *Lead, Metals, Hydrogen ion concentration, Bioassay, *Model studies, Cations, Chemical properties, Chemical reactions, *Toxicity, Limnology, Aquatic environment, Mathematical studies, Kinetics.

In limnological and aquatic toxicity studies the interactions between ligands and metals are often ignored. Tests were conducted to show the effects of phosphate on toxicity of lead in a synthetic medium. The REDEQL2 chemical equilibrium model was used to calculate lead speciation at different total concentrations of lead and phosphate and at pH 6 or 8. At pH 6, very little free lead was found to exist at high phosphate concentrations, regardless of total lead levels. Little free lead was predicted at any phosphate level at pH 8. Static bioassays on the amphipod, Hyallela azteca, were conducted to test the role of free lead versus total lead in causing toxicity. Graphs of mortality data for the maximum lead level (5 milligrams/liter) at three different phosphate levels show the detoxifying effect of increasing phosphate concentrations. Some physiological stresses due to the synthetic media, observed via control mortalities, explain slight deviations of observed results from predicted values at the highest (0.003 M) levels of phosphate tested. These findings demonstrate the value of chemical and kinetic equilibrium models in examining the interaction of extraneous substances which might affect results in aqueous systems. (Geiger-FRC)

PARAQUAT TOXICITY TO LOUISIANA CRAYFISH (PROCAMBARUS CLARKII),

Southern Univ., Baton Rouge, LA. Dept. of Biological Sciences.
T-S. Leung, S. M. Naqvi, and N. Z. Naqvi.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 3, p 465-469, May-June, 1980. 2 Fig, 4 Tab, 9 Ref.

Descriptors: *Bioassays, *Mortality, *Crayfish, *Toxicity, *Mississippi River, *Paraquat, Lethal limits, Aquatic ecosystems, Rivers, Water pollution, Herbicides, Aquatic animals, Crustaceans, Chlorinated hydrocarbon pesticides, Organophosphorus pesticides, Water pollution sources.

Paraquat is highly soluble in water and is used extensively in Louisiana to control all annual grassy and broadleaf weeds. If sufficient levels of the herbicide reach aquatic ecosystems, toxic effects on aquatic species might occur. The toxicity of paraquat to adult and juvenile Louisiana crayfish, an important human food, was examined in laboratory tests. Bioassays were conducted in Mississippi River Bayou water, with adult crayfish being exposed to 6 concentrations of paraquat (15-100 ppm) and juveniles to 5 levels of the herbicide (0.5-8.0 ppm). Dissolved oxygen, temperature, pH, and crayfish mortality were checked every 24 hours over the course of 96 hours. A significantly greater amount of oxygen was consumed by treated crayfish, in a dose-dependent and exposure time-dependent pattern. At 25 ppm, no mortality occurred in adults, while at only 8 ppm, 50% mortality was found for juvenile crayfish after 24 hours. The death rate increased with exposure time for both juveniles and adults. Juveniles proved more susceptible than adults to paraquat in the present study, and also to aldrin and mirex in other experiments reported in the literature. Adult crayfish also showed a dose-dependent hyperactivity with exposure to paraquat; this was not explained. (Geiger-FRC)

LEAD IN THE MARINE ENVIRONMENT,
M. Waldichuk.
Marine Pollution Bulletin, Vol 11, No 9, p 241-242, September, 1980.

Descriptors: *Lead, *Sea water, Toxicity, Analytical techniques, Regulation, Europe, Water analysis, Absorption, Water pollution, Heavy metals.

A general discussion is presented of lead, its toxicity, and research and monitoring efforts in marine environments. Reliable analyses of lead in sea water have been plagued with problems of contamination, interference, and high background levels. The California Institute of Technology has conducted some high quality analyses using the isotopic dilution technique with mass spectrometry. The Marine Biological Association of the United Kingdom in Plymouth has done some of the best work on lead uptake. New British regulations effective April 12, 1980 set specific limits for lead in fish (2 mg/kg) and shellfish (10 mg/kg). (Small-FRC)

AN APPARATUS FOR THE PREPARATION OF VARYING CONCENTRATIONS OF CHEMICALS FOR TOXICITY TESTS WITH AQUATIC ORGANISMS,
Natural Environment Research Council, (Bangor Wales). Marine Invertebrate Biology Unit.
A. R. Manley.
Water Research, Vol 14, No 8, p 1023-1027, August, 1980. 6 Fig, 6 Ref.

Descriptors: *Toxicity, *Water pollution, *Laboratory equipment, *Aquatic life, Monitoring, Testing, Aquatic environments, Research equipment, Automatic control, Model studies, Performance, Fluctuations, Simulation analysis, Discharge.

An increase in the chemical pollution of the aquatic environment has prompted the manufacture of an array of equipment to simulate chemical discharges for toxicity testing under a variety of environmental conditions. The apparatus described here is capable of producing planned variations in chemical levels for aquatic toxicity tests to allow more realistic study of naturally occurring variations and their effects on aquatic life. The apparatus was designed to produce chemical concentration gradients over short or extended time spans at high flow rates. The apparatus was also made from chemically inert material. The new device was equipped with an animal chamber, constant head tanks, uncontaminated water at a constant flow, a distilled deionized water stock tank, a mixing chamber, peristaltic pump, a chemical solution stock tank, Teflon tubing, an Ultrograd and an Ultrograd valve. Satisfactory levels of accuracy are achieved in chemical dosing with the apparatus under a variety of toxicity testing conditions. However, abrupt changes in the concentration of a pollutant still cause problems in the system resulting in about a 4.5 minute delay between actual and recorded concentrations. (Geiger-FRC)

RIPARIAN ECOSYSTEMS: A PRELIMINARY ASSESSMENT OF THEIR IMPORTANCE, STATUS, AND NEEDS.
Fish and Wildlife Service, Kearneyville, WV. Eastern Energy and Land Use Team.
Report, August 1980. 18 p, 64 Ref.

Descriptors: *Wildlife habitats, *Riparian land, *Ecosystems, *Floodplains, Water quality, Fish, Esthetics, Value, Land use, Land management, Economic justification, Conservation, Water quality, Wetlands, Environmental effects, Evaluation.

Riparian ecosystems have outstanding values for fish and wildlife, supporting very diverse and productive animal communities. A majority of the nation's wildlife, including a relatively large proportion of endangered species depend on riparian habitats for survival. In their natural condition floodplain ecosystems have tremendous intrinsic and potential values. Riparian systems function as a buffer between aquatic ecosystems and potential values. Riparian systems function as a buffer between aquatic ecosystems and potential impacts of upland activities upon water quality. Most riparian systems are jeopardized by intensive economic pressures for a variety of alternative land and water uses, including channelization, farming, flood control, grazing, hydroelectric projects, irrigation, water salvage efforts, and recreation. Consequently, 70 to 90% of all original riparian communities in the United States have already been destroyed. High fish and wildlife values, multiple intrinsic values and high economic values of natural riparian ecosystems argue for their protection and management. Extensive and continued loss of riparian habitat and associated fish and wildlife populations is testimony to the ineffectiveness of present conservation efforts. (Moore-SRC)

A MATHEMATICAL MODEL SIMULATING FISH LOSSES NEAR POWER PLANTS USING ROTENONE DATA,
Rensselaer Polytechnic Inst., Troy, NY. Dept. of Chemical and Environmental Engineering.
C. Kleinstreuer, and B. E. Logan.
Water Research, Vol 14, No 8, p 1047-1053, August, 1980. 7 Fig, 3 Tab, 33 Ref.

Descriptors: *Model studies, *Power plants, *Rotenone, *Fish populations, *Mortality, Toxicity, Lakes, Rivers, Aquatic ecosystems, Mathematical studies, Hydrodynamics, Temperature, Environmental effects, Future planning, Screens, Intakes.

Impingement studies at power plants have shown that cooling water intake screens have played a major role in fish loss and alterations in aquatic biota. The present study examines the main factors causing impingement, and attempts to develop an indicator to predict high impingement losses and which fish species will be affected. Far field estimates were used to gather data on flow patterns, temperature, and fish populations. Rotenone data was used specifically for estimating fish numbers because its application to the power plants was most consistent year after year. A method was devised to utilize rotenone samples to predict which fish species were the most likely to be impinged in greatest quantity based on their abundance in the fishery. The model was successfully applied to the Arkansas Nuclear One Plant (a lake with a long intake canal) and Brown's Ferry, Tennessee (a river with a short intake canal). The impingement model was also designed to be applicable to other sites for toxicity or fish mortality studies. It was proposed that the model along with the systems analysis approach be used in future planning in regard to optional location and design of power plant facilities. (Geiger-FRC)

STREAM CATION CONCENTRATIONS AND LOSSES FROM DRAINAGE BASINS WITH CONTRASTING LAND USES IN SOUTHERN ONTARIO,
York Univ., Toronto (Ontario). Dept. of Geography.
A. R. Hill.
Water Research, Vol 14, No 9, p 1295-1305, September, 1980. 5 Fig, 6 Tab, 18 Ref.

Descriptors: *Minerals, *Agricultural watersheds, Land management, Cations, Land use, Effects, Forest watersheds, Urban drainage, Ontario.

Factors affecting the concentration and loss of calcium, magnesium, potassium and sodium from 22 watersheds near Toronto, Ontario were investigated over a 27 month period. Human activities in agricultural and land use practices, soils, surface geology and topographic features were considered in relation to mineral and nutrient levels of the watersheds. Positive relationships were noted between calcium and potassium levels and crop area, while a negative correlation was observed between these cations and abandoned farm land plus forest and sand areas plus sandy loam soils. Multicolinearity was found between land use and soils, resulting in the association of soil properties and farming activities with stream cation levels. Lower annual stream discharges in agricultural watersheds than in watersheds surrounded by areas of forest and non-farm lands caused no correlations to appear between crop area and annual losses of calcium and potassium. Losses of potassium and sodium and stream levels of these cations were positively correlated with urban land use. Urban sampling regimes established that these areas are major supply wells for sodium and to a lesser extent, potassium, eventually found in streams. Variations in watershed hydrology had a major effect upon levels of magnesium, with little influence from urban or agricultural land use. (Geiger-FRC)

BIOACCUMULATION PROFILES OF 35S-LABELLED SODIUM ALKYLPOLY(OXYETHYLENE) SULFATES IN 35 CARP (CYPRINUS CARPIO),
Tokyo Metropolitan Research Inst. for Environmental Protection, Tokyo (Japan).
M. Kikuchi, M. Wakabayashi, H. Kojima, and T. Yoshida.
Water Research, Vol 14, No 10, p 1541-1548, October, 1980. 6 Fig, 3 Tab, 9 Ref.

Descriptors: *Toxicity, *Surfactants, *Carp, Aquatic life, Metabolism, Fish physiology, Water pollution effects, Laboratory tests, Environmental effects, Water pollution, Detergents, Water pollution sources.

Surfactants present as pollutants in the aquatic environment are often accumulated by aquatic organisms. The uptake, distribution and elimination of radioactively labelled sodium dodecyltri(oxyethylene)sulfate (C-12-AES 3) and sodium dodecylpenta(oxyethylene)sulfate (C-12-AES 5) were studied in carp (Cyprinus carpio). Carp were exposed to concentrations of 0.3-0.6 milligrams/liter of the compounds during the various experiments. Levels of detergents were measured by whole-body autoradiography and liquid scintillation counting. Rapid absorption of the compounds occurred via the gills and skin. After 24 hours of exposure, high levels of radioactivity were noted in gills, hepatopancreas, gall bladder, intestinal content and oral and nasal cavities. Similar distribution patterns for C-12-AES 3 and C-12-AES 5 were observed. Carp whole body concen-

tration factors after 72 hours of exposure were calculated to be 18 for C-12-AES 3 and 4.7 for C-12-AES 5. The absorbed radioactivity was eliminated more rapidly from fish exposed to C-12-AES 3 than to C-12-AES 5 in surfactant-free water, with elimination from the gills and hepatopancreas proceeding more rapidly than that from the gall bladder. INFLUENCE OF WATER HARDNESS ON CADMIUM TOXICITY TO SALMO GAIRDNERI RICH,
Istituto di Ricerca sulle Acque, Milan (Italy).
D. Calamari, R. Marchetti, and G. Vailati.
Water Research, Vol 14, No 10, p 1421-1426, October, 1980. 1 Fig, 4 Tab, 25 Ref.

Descriptors: *Hardness, *Toxicity, *Rainbow trout, *Cadmium, Calcium, Heavy metals, Fish physiology, Water pollution, Laboratory tests, Lethal limits, Theoretical analysis, Chemical properties.

The effects of water hardness as well as the chemical species of metals on the acute toxicity of cadmium (Cd) to rainbow trout were examined in laboratory tests. The acute toxicity of Cd to trout was increased by reducing water hardness. The theoretical distribution of the chemical species of Cd in water of different levels of hardness at pH 7.2 was determined. Different levels of mortality were observed in fish exposed to similar concentrations of Cd in the same form. Different amounts of ionic-form Cd gave similar acute toxic effects. When fish acclimated at 320 milligrams CaCO3/liter were tested at 20 milligrams CaCO3/liter, an intermediate toxic effect was noted, showing agreement with the biological hypothesis. The proliferation of chloride cells in gills often accompanies exposure to toxic levels of metals. Fish exposed to hard water would normally contain a larger number of these cells, thereby making them more resistant to the toxic actions of Cd. Fish maintained in waters of a variety of hardnesses had different ionic contents in the blood, but the same number of chloride cells in the gills. Therefore detoxification schemes based mainly on the increase in chloride cells should be independent of hardness and show more relation to the presence of metals. However, some findings indicate the toxic action of Cd depends upon water hardness as a regulator of gill permeability. (Geiger-FRC)

AN APPROACH TO CHEMICAL AND BIOLOGICAL RIVER MONITORING SYSTEMS,
Southern Water Authority (England).
A. D. Hamer, and P. G. Soulsby.
Water Pollution Control, Vol 79, No 1, p 56-69, January, 1980. 5 Fig, 4 Tab, 30 Ref.

Descriptors: *Rivers, *Monitoring, *Reviews, *Water quality, *Bioindicators, *Water quality standards, Mathematical studies, Model studies, Water pollution control, Water pollution treatment, Sewage treatment, Fluctuations, Aquatic animals, Invertebrates, Biological communities, Water quality control, Diurnal, Streams.

New guidelines for the chemical and biological monitoring of river water are outlined to comply with quality objectives of the Water Act of 1973 and the Pollution Act of 1974. Chemical monitoring of a river is usually done to establish the long-term quality of the system, for pollution control and investigation, or for water quality monitoring. Quality monitoring should be done at frequent intervals; however, usually sampling is only done on a monthly basis. Mathematical evidence is presented to indicate the importance of obtaining an adequate number of samples to ensure accurate data. The effects that a particular discharge might have on the flora and fauna of the receiving stream are of particular importance in pollution investigations. The effects of diurnal fluctuations in effluent flows are considered in relation to sewage treatment works. Water quality modeling used a simple mass balance equation as a mathematical model. As yet, criteria have not been established for the biological surveillance of river water quality through the study of microinvertebrates. Problems of sampling and data analysis in biological monitoring are reviewed. Other data analysis techniques often used in biological studies include multivariate techniques, ordination, clustering, abundance categories, and community schemes. Taxa are characterized in an unpolluted Upper Chalk stream and an unpolluted tertiary stream to illustrate the application of principal component analysis, a multivariate technique, over a three year period. It was suggested that, regardless of costs, chemists as well as biologists take appropriate measures to gain the skills which will be needed for successful water quality monitoring in the future. MICROBIAL DYNAMICS OF TWO SUB-ARCTIC CANADIAN RIVERS,
Simon Fraser Univ., Burnaby (British Columbia). Dept. of Biological Sciences.
L. J. Albright, K. V. Masuda, G. L. Ennis, and H. Schreier.
Water Research, Vol 14, No 9, p 1353-1362, September, 1980. 8 Fig, 6 Tab, 30 Ref

Descriptors: *Rivers, *Sub-Arctic, *Aquatic productivity, *Microorganisms, Canada, Algae, Primary productivity, Ice breakup, Bacteria, Plankton, Standing crops.

Microalgal and bacterial biomasses and activities of two sub-Arctic rivers, Ogilvie and Swift Rivers, were greatest in spring and summer with decresing values noted through fall and winter. The data obtained suggests that light and dissolved organic carbon may be the major factors controlling standing crops and activities of microalgae and bacteria respectively. In late fall and winter, the phytoplankton and bacterioplankton were observed to be under greater physicochemical stress as compared to spring and summer. Microorganisms were more productive in the Ogilvie River than in the Swift River during all seasons. The authors suggest that the difference in productivity was due to the greater levels of total inorganic carbon and dissolved organic carbon found in the Ogilvie as compared to the Swift River at equivalent times of the year. AVOIDANCE RESPONSE OF RAINBOW TROUT (SALMO GAIRDNERI) TO SINGLE-DOSE CHLORINATION IN A POWER PLANT DISCHARGE CANAL,
Wisconsin Electric Power Co., Milwaukee. Environmental Dept.
P. D. Schumacher, and J. J. Ney
Water Research, Vol 14, No 6, p 651-655, June, 1980. 3 Fig, 2 Tab, 23 Ref.

Descriptors: *Toxicity, *Rainbow trout, *Chlorination, *Fish behavior, *Electric powerplants, *On-site tests, Canals, Lethal limits, Chlorine, Water pollution, Water treatment, Statistics, Distribution patterns, Analytical techniques, Lake Michigan, Effluents, Discharge, Thermal pollution, Water pollution sources, Aquatic animals.

The use of chlorination to control biofouling in stream electric plants may not affect aquatic life if avoidance responses to chlorine are practiced. The initial avoidance responses of rainbow trout (Salmo gairdneri) to single-dose chlorine additions in a power plant discharge canal were examined as a function of chlorine concentration and total exposure. Trout were exposed in a cooling water discharge canal of Wisconsin Electric Power Company's Lakeside Plant on Lake Michigan to chlorine additions designed to achieve maximum total residual chlorine (TRC) levels of 0.04, 0.2, 0.6, and 1.0 milligrams/liter. The first retreat of trout from the chlorine front was observed at 0.05 milligrams/liter TRC. About 95% of the trout moved downstream at 0.5 milligrams/liter TRC. Fish retreated from the exposure area well before cumulative time-dose exposure approached lethal limits. The decrease in percentage of fish near the discharge was linear with increasing TRC levels. It was suggested that complete evaluations of the use of the avoidance response must take into account trout distribution throughout chlorination and the chance for repeated exposures. (Geiger-FRC)

LONG-TERM EFFECTS OF PCB (CLOPHEN A50) ON GROWTH, REPRODUCTION AND SWIMMING PERFORMANCE IN THE MINNOW, PHOXINUS PHOXINUS,
National Swedish Environment Protection Board, Studsvik. Brackish Water Toxicology Lab.
B-E. Bengtsson.
Water Research, Vol 14, No 6, p 681-687, June, 1980. 4 Fig, 4 Tab, 31 Ref.

Descriptors: *Toxicity, *Fish behavior, *Minnows, *Fish reproduction, *Polychlorinated biphenyls, Pollutants, Water pollution, Fish toxins, Fish diets, Spawning, Laboratory tests, Fish physiology, Growth rates, Aquatic animals, Gas chromatography, Temperature, DDT, Chlorinated hydrocarbon pesticides, Pesticides.

The long-term sublethal effects of Clophen A50, a mixture of more than 50 polychlorinated biphenyl compounds (PCB), on the minnow (Phoxinus phoxinus) were examined in laboratory tests lasting 300 days. PCB's have been found as contaminants of many natural waters, and their toxicity to various aquatic organisms has been documented. In the present study, mortality, growth, swimming performance and reproduction were studied in minnows fed 20, 200 or 2000 micrograms PCB/g food (dry weight) for 40 days. Clophen A50 was found to promote the growth of minnows. Uptake of PCB residues varied between 22 and 36% upon gas chromatographic analysis of fish tissues. Mortality rate was very slow for all groups, but began to accelerate towards the end of the experiment At the highest dose level, PCB delayed spawning and significantly reduced egg hatchability. Hatching times were significantly reduced in fish fed the medium and high doses of PCB. Effects of temperature upon hatchability and of egg formation and spawning on PCB body residues are also considered. No effects due to PCB were observed on swimming performance. (Geiger-FRC)

CELLULAR BIOASSAY OF FISH AS A SENSITIVE INDEX OF WATER QUALITY RELATED TO MINE WATER,
West Virginia Univ., Morgantown. Water Research Inst
D. E. Hinton, and E. R. Walker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-149742, Price codes: A07 in paper copy, A01 in microfiche. Technical Completion Report, 1980. 139 p, 59 Fig, 9 Tab, 74 Ref. OWRT-A-037-WVA(1), 14-34-0001-0152.

Descriptors: *Acid mine water, *Water pollution effects, *Fish, *Bioassay, *Water quality, Analysis, Analytical techniques, Cytological studies, Coal mine wastes, Methodology, Mine water, Trace elements, Water quality standards, Chemical analysis, Evaluation, Metals.

The overall objective was to develop a cellular bioassay useful in determining the effects of constituents of mine water (acid, pH, and metals) upon tissues and enzymes of freshwater fishes and to determine, via biological criteria, water quality Coal-associated polynuclear aromatics caused induction of drug metabolizing enzymes in fish Mn(++) caused enhanced metabolism of benzo (a) pyrene in-vitro but was inhibitory under in-vivo conditions in rainbow trout. Particulate iron (Fe2O3) suspended in aquarium water and Mn(++) caused gill alterations. Most subtle changes involved swelling of surface epithelial cells (both metals) and appearance of phagocytic cells in secondary lamellae (Fe2O3) Mn(++) caused a reduction in the surface microridge pattern of gill epithelia. A quantitative morphometric

evaluation of control and acid-stressed (pH 4.0 or 5.0 by addition of H2SO4 to aquarium water) bullhead catfish showed a two-fold increase in the number of skin mucous cells of exposed fish, which was associated with an equivalent increase in volume density of skin mucosubstances. The three individual components of mine waters produced alterations which were easily differentiated from those produced by other agents and constitute evidence that cellular bioassay of target tissues in exposed fishes may yield valuable information relative to water quality.

ECOLOGICAL RESPONSE TO RELAXATION OF SEWAGE STRESS OFF SAN ISLAND, OAHU, HAWAII,
Hawaii Univ., Honolulu.
S. J. Dollar.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-135436, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Research Center, University of Hawaii, Honolulu, Technical Report No 124, March, 1980. 84 p, 34 Fig, 2 Tab, 28 Ref, 2 Append. 14-34-0001-9013.

Descriptors: *Benthos, *Reefs, *Coral, *Ecology, Sewage effluents, *Hawaii, Speciation, Macrobenthos.

The largest domestic sewage outfall in Hawaii discharged 3 cu m/s (62 mgd) of raw sewage in 10 m of water approximately 1,000 m off Sand Island, Oahu, from 1955 to 1977. Results of an ecological field study of epibenthic communities in proximity to Sand Island conducted in 1975 and 1979 show clear patterns of community change associated with both sewage impact and relaxation of this stress; negative community effects attributable to sewage input decreased, and degree of recovery of community structure increased with distance from the point source of discharge. Sewage discharge had an impact of up to 5,000 m west and 1,900 m east of the outfall. This elliptical area of influence is assymetrical to the west due to the prevailing current pattern which carried the sewage-laden plume to the southwest. Following sewage abatement two distinct zones of impact are distinguished by the degree of physical degradation of the benthic reef structure. A high impact zone extending some 500 m east and 1,000 m west of the outfall is now characterized by a complete biochemical reduction of the reef structure to a pitted, flat carbonate pavement covered presently with sediment-bound algal turf and few benthic faunal colonizers. In the zone of intermediate impact the old reef framework is largely intact, though devoid of most living corals. Instead a veneer of encrusting coralline algae covers most of the reef framework. Patterns of occurrence and diversity of reef fish show characteristics of response to sewage stress similar to attached invertebrates except that the area of influence is of much smaller extent. ROLE OF SEAGRASSES IN ESTUARINE SYSTEMS,
Seattle Pacific Univ., WA. School of Natural and Mathematical Sciences.
R. C. Phillips.
In: Proceedings of the Gulf of Mexico Coastal Ecosystems Workshop, September 4-7, 1979, Port Aransas, Texas, Fore, P. L., and Peterson, R. D., Eds., Fish and Wildlife Service, Office of Environment, Report FWS/OBS-80/30, May, 1980, p 67-96. 1 Tab, 126 Ref, 1 Append. OCE 74-24358 A01.

Descriptors: *Marine plants, *Estuarine environment, *Seagrasses, *Ecology, Ecosystems, Water pollution effects, Salinity, Water temperature, Primary productivity, Cycling nutrients, Dredging, Aquatic animals, Eutrophication, Depth.

Owing to the protection from erosion they provide, their role in sediment accretion, and their high primary productivity, seagrasses are extremely important to coastal ecosystems. Estuaries typically support large seagrass meadows, and 80 to 90% of commercial and sport fishes depend on estuaries for part or all of their life cycle. Seagrasses appear to be euryhaline, with various species growing in waters of 6 to 60 parts per thousand salinity, and they tolerate a wide range of water temperatures. The depth distribution of seagrasses depends on interrelated factors: waves, currents, substrate, turbidity, and light penetration. Productivity, role in the food chain, nutrient cycling, and sediment stabilization are important ecological functions of seagrass meadows. Dredging poses the greatest threat to the seagrass ecosystem. Other hazards to seagrasses include eutrophication, temperature and salinity changes due to man's activities, wind and sea stress, population explosions, oil pollution, heavy metal pollution, and dumping of other toxic substances. Techniques for measuring the productivity of seagrasses are described in the appendix. (Moore-SRC)

ECOLOGY OF A HYPERSALINE LAGOON: THE LAGUNA MADRE,
Texas Univ. at Austin, Port Aransas. Port Aransas Marine Lab.
W. Pulich, Jr.
In: Proceedings of the Gulf of Mexico Coastal Ecosystems Workshop, September 4-7, 1979, Port Aransas, Texas, Fore, P. L., and Peterson, R. D., Eds., Fish and Wildlife Service, Office of Environment, Report FWS/OBS-80/30, May, 1980, p 103-122. 5 Fig, 2 Tab, 31 Ref.

Descriptors: *Estuarine environment, *Saline water, *Cycling nutrients, *Lagoons, *Ecology, Texas, Salinity, Marine plants, Detritus, Marine algae, Light penetration, Productivity, Water pollution, Seagrasses, Laguna Madre(TX).

A coastal Gulf of Mexico ecosystem, the Texas Laguna Madre represents one of only three oceanic hypersaline lagoons in the World. Salinity fluctuations between 30 and 60 per thousand now constitute a major feature of Laguna Madre. The overriding influence of salinity makes the Upper Laguna too unstable for biological succession, and consequently colonizing species persist. The Lower Laguna has showed shifts in species abundance in recent years. Environmental constraints have led to the dominance of three monotypic plant habitats: seagrass beds, algal mat communities, and drifting seaweeds. While the species distribution of benthic plants in the Laguna Madre is attributable to the general salinity conditions, the abundance of seagrasses in the Upper Laguna may be traced to the water clarity and nutrient loading effects. The combination of low nutrient input, but high primary and secondary production of the Upper Laguna indicates the efficiency of the nutrient cycling process there. Any activity which opens the system to flushing would cause significant impact on cycling of nutrients from detritus. The accumulation of pollutants in the Laguna also presents a real threat to sustained productivity. Pollutants such as pesticides and metals, drained from Rio Grande Valley agricultural and residential areas certainly are changing the Lower Laguna today. (Moore-SRC)

MANAGING IMPACTS OF PETROLEUM DEVELOPMENT IN BRACKISH MARSHES,
General Land Office of Texas, Austin.
W. Longley, and R. G. Jackson.
In: Proceedings of the Gulf of Mexico Coastal Ecosystems Workshop, September 4-7, 1979, Port Aransas, Texas, Fore, P. L., and Peterson, R. D., Eds., Fish and Wildlife Service, Office of Environment, Report FWS/OBS-80/30, May, 1980, p 157-174. 12 Ref.

Descriptors: *Oil fields, *Brackish water, *Coastal marshes, *Environmental effects, *Management, Exploration, Natural gas, Wetlands, Marsh management, Flow, Ecosystems, Hydrology, Canals, Levees, Roads, Construction, Texas, Blaumont area(TX).

Petroleum exploration and extraction operations produce two obvious levels of ecological effects in marsh ecosystems. The first level involves the radical change or complete removal of a given parcel of the system. Unrestrained growth and development of an oil field maximizes habitat fragmentation, which can radically alter the ecological character of the ecosystem. The second level of effects occurs when threshold levels of critical linkages or components are reached, and the ecosystem changes noticeably. Water is the major factor in maintaining marsh systems. Brackish marshes and delta marshes characteristically receive inputs of both saline and fresh water, although not in equal proportions. The movement of water through the system is the important force driving and controlling the wetlands. Because roads, levees, and canals alter water flows, they are considered to be the source of the most important impacts at the ecosystem level. Methods of reducing significant impacts from oil and gas operations can be catergorized as: minimizing total habitat losses during each phase of petroleum activities; maintaining adequate major water flows for the particular wetland ecosystem; and providing for restoration of landforms and conditions after petroleum operations have terminated. (Moore-SRC)

5D. Waste Treatment Processes

OPTIMAL PERIODIC CONTROL OF ACTIVATED SLUDGE PROCESSES: II. COMPARISON WITH CONVENTIONAL CONTROL FOR STRUCTURED SLUDGE KINETICS,
Houston Univ., TX. Dept. of Chemical Petroleum Engineering.
S. Y. S. Yeung, D. Sincic, and J. E. Bailey.
Water Research, Vol 14, No 1, p 77-83, January, 1980. 5 Fig, 2 Tab, 8 Ref, 1 Append.

Descriptors: *Waste water treatment, *Activated sludge, *Mathematical models, *Automatic control, Kinetics, Biochemical oxygen demand, Flocculation, Microbial degradation, Organic loading, Design.

Optimal periodic control and conventional control of activated sludge are compared by means of mathematical models. Conventional control was defined as a steady-state base case design augmented by a regulating controller of a kind typically used for the activated sludge process. For two quite different examples, periodic control reduced effluent BOD and/or its variability relative to conventional control. The optimal periodic control for structured sludge kinetics can be substantially different from the Monod/decay result. This result has important implications. If minimization of effluent BOD is the objective, classical control may produce control manipulations that are nearly opposite to the most effective response. Since the structured kinetics are believed more accurately to reflect the true behavior of the system, use of Monod/decay kinetics must be viewed with caution in designing conventional or optimal periodic dynamic operational strategies. Since the structured model may behave approximately like the Monod model or much differently, depending upon its parameter values, accurate kinetic parameter identification for a particular process is important in designing operational approaches. THE TREATMENT OF MALT WHISKEY DISTILLERY WASTE USING THE FUNGUS GEOTRICHUM CANDIDUM,
New Univ. of Ulster, Coleraine (Northern Ireland). School of Biological and Environmental Studies.
J. P. Quinn, and R. Marchant.
Water Research, Vol 14, No 5, p 545-551, May, 1980. 3 Fig, 6 Tab, 23 Ref.

Descriptors: *Waste water treatment, *Fungi, *Cultures, *Biochemical oxygen demand, *Chemical oxygen demand, Carbon, Economic feasibility, Biomass, Proteins, Organic wastes, Industrial wastes, Whiskey distillery waste, Malt.

The effects of the imperfect fungus Geotrichum candidum in reducing the BOD, COD, and total organic carbon (TOC) of Irish malt whiskey distill-

ery waste are reported. When the fungus was grown in batch and in single and tow-stage continuous laboratory culture, a maximum BOD reduction of 92.2% was achieved. Maximum reductions of 80.6% and 75.6% were achieved for COD and TOC, respectively. When a two-stage continuous culture system was used, the fungal biomass removed from the second fermenter, when operated at a dilution rate of 0.125/hr, was found to have a true protein content of 45.5%. The economic prospects of using this process for waste treatment and perhaps as a source of single-cell protein seem encouraging. (McKeon-FRC)

DENITRIFICATION WITH METHANOL: MICROBIOLOGY AND BIOCHEMISTRY,
Natal Univ., Peitermaritzburg (South Africa). Dept. of Biochemistry.
G. R. Nurse.
Water Research, Vol 14, No 5, p 531-537, May, 1980. 5 Fig, 56 Ref.

Descriptors: *Water treatment, *Denitrification, *Mathematical models, Microbiology , Chemical reactions, Anaerobic bacteria, Nitrates, Activated sludge, Carbon, Biomass, Equations.

The development of a theoretical equation that adequately describes the stoichiometry of the denitrification of nitrate-polluted effluents with methanol is presented. Kinetic parameters previously reported have been for an unidentified biomass, as it was believed that the composition of bacterial species present in reactors was unimportant. However, denitrification with methanol results in selective enrichment of the genus Hyphomicrobium. Nitrate assimilation and respiration in inorganic nitrogen metabolism, methanol oxidation, and methanol assimilation are discussed. To develop the desired equation, the amounts of methanol and nitrate required to supply the total energy and reducing power requirements for the biosynthesis of cell material were determined. The energy requirement for 3-phosphoglycerate (3-PGA) and energy and reducing power requirements for synthesis of cells form 3-PGA with nitrate as nitrogen source and for synthesis of cells from methanol and nitrate were calculated as equations. From these, the equation 50.5 CH3H + 3 HN3 + 46.2 N3(-) yields 3 C4H72N + 38.5 C2 + 23.1 N2 + 46.2 H(-) + 68.9 H2 is derived. When the equation was used to calculate a theoretical growth yield (0.188 g cells/g methanol on an ash-free basis) or a consumptive ratio (1.31), the values obtained closely agreed with experimental values. This corresponds to experimental values of 0.195 g cells/g methanol with an ash content of 3.7% and a consumptive ratio of 1.30 plus or minus 0.06. The development of an equation describing the upper limit to the yield parameter is important for optimizing.

ESTIMATION OF NITRIFYING BIOMASS AND KINETICS IN WASTEWATER,
McMaster Univ., Hamilton (Ontario). Dept. of Chemical Engineering.
E. R. Hall, and K. L. Murphy.
Water Research, Vol 14, No 4, p 297-304, April, 1980. 6 Fig, 4 Tab, 31 Ref.

Descriptors: *Waste water treatment, *Nitrification, *Microorganisms, *Nitrates, Nitrites, Kinetics, Bacteria, Oxidation, Tertiary treatment, Biomass.

A technique for in situ measurement of nitrogen oxidation rates in waste waters is described. An estimate of the nitrifying populations and their maximum specific substrate rates in the presence of heterotrophic organisms can be made by the direct addition of known quantities of pure nitrifiers to a mixed liquor sample, along with selective inhibition of Nitrosomonas activity. The design and modeling of combined carbon removal-nitrification systems for steady and dynamic loading conditions is made possible by knowledge of these parameters. Nitrogen oxidation was shown to be zero order for substrate and first order for microorganism concentration. Populations of nitrifiers in mixed liquor increased significantly with total Kjeldahl nitrogen loading. In addition, substantial changes were noted in maximum unit oxidation rates. This suggested a differential effect of heterotrophic organisms on nitrifying bacteria. (McKeon-FRC)

SIGNIFICANCE OF COD, BOD AND TOC CORRELATIONS IN KINETIC MODELS OF BIOLOGICAL OXIDATION,
West Pakistan Univ. of Engineering and Technology, Lahore.
J. A. Aziz, and T. H. Y. Tebbutt.
Water Research, Vol 14, No 4, p 319-324, April, 1980. 7 Fig, 1 Tab, 11 Ref.

Descriptors: *Biochemical oxygen demand, *Chemical oxygen demand, *Waste water treatment, *Organic loading, Correlation analysis, Model studies, Organic compounds, Biological treatment, Activated sludge, Oxidation, Mathematical studies, Kinetics, Sewage effluents, Domestic wastes.

At the Birmingham University, England, pilot plant for treating domestic sewage by activated sludge, correlations between COD, BOD, and total organic carbon (TOC) were analyzed at various stages of waste treatment. Automatic hourly collections were made over a 24-hr period from the influent to the aeration tanks and from the effluents from the final clarifiers. A significant correlation was found between COD and BOD for settled domestic sewage ($r = 0.747$, $p < 0.05$). As biological treatment proceeded, COD:BOD ratios of treated effluents increased, and no conclusively significant correlation between the parameters was found. BOD:TOC ratios decreased during treatment and were not significantly correlated in any filtered or unfiltered samples. Similarly, TOC was not satisfactorily related to COD. Studies of biological oxidation kinetic models revealed that these polluted assessment parameters are not interchangeable unless changes are made in the mathematical constants. Therefore, the indiscriminate interchanging of BOD, COD, and TOC in biological oxidation studies is not advisable. (Geiger-FRC)

AN EVALUATION OF PRETREATED NATURAL ZEOLITES FOR AMMONIUM REMOVAL,
Monsanto Research Corp., Dayton, OH. Dayton Lab.
J. R. Klieve, and M. J. Semmens.
Water Research, Vol 14, No 2, p 161-168, February, 1980. 1 Fig, 9 Tab, 22 Ref.

Descriptors: *Zeolites, *Ammonium, Water treatment, *Waste water treatment, Analytical techniques, X-ray diffraction, *Tertiary treatment, *Nutrient removal, Nitrogen compounds, Acids.

The results of laboratory studies on the evaluation of phillipsite, mordenite, erionite, and pretreated clinoptilolites for ammonium removal from wastewater are presented. Clinoptilolite's capacity for NH4(+) was not significantly affected by heat treatment (600C for 1 hr), but the zeolites capacity for NH4-N in the presence of competing cations was increased. The selectivity of clinoptilolite for ammonium was thus enchanced. Upon treating clinoptilolite with NaOH, its capacity for NH4-N using a pure solution of NH4Cl as feed was slightly improved, but the zeolite's selective capacity for NH4-N in the presence of competing cations was not affected. Acid (HNO3) and steam treatments did not influence clinoptilolite's capacity for NH4-N. Phillipsite's observed selectivity for ammonium was equal to clinoptilolite's, and its higher total capacity resulted in an effective capacity that was about double that of clinoptilolite on a weight basis. Unfortunately, phillipsite is structurally weak and breaks easily to produce fines, and it is about twice as expensive as clinoptilolite. If the strength of phillipsite could be improved with a binder it may become useful for water treatment. Erionite and mordenite removed ammonium poorly. (McKeon-FRC)

SOME DIMENSIONLESS PARAMETERS OF IMPELLER POWER IN COAGULATION-FLOCCULATION PROCESSES,
Agricultural Univ., Wageningen (Netherlands). Dept. of Water Pollution Control.
J. Leentvaar, and T. S. J. Ywema.
Water Research, Vol 14, No 2, p 135-140, February, 1980. 8 Fig, 3 Tab, 12 Ref.

Descriptors: *Waste water treatment, *Flocculation, *Coagulation, *Impellers, Colloids, Reynolds number, Pilot plant, Mixing, Treatment facilities, Mathematical studies, Domestic wastes, Velocity.

The effect of impeller and vessel geometry on impeller power dissipation was discussed. Particular attention was paid to square tanks as commonly used in coagulation-flocculation processes of waste waters. A pilot-scale dynamometer was used to measure dissipated energy into the water by the impeller as a function of revolutions/min. Four stirrers were used: a paddle, a small and a large two bladed propeller, and a turbine stirrer. The experiments showed that the dimensionless Power number for a square tank can be estimated by the Power number of a baffled cylindrical tank with distance between two baffles equal to the diameter of the square tank. The experiments showed a direct ratio between G value (average velocity gradient of the fluid) and another dimensionless number, the Reynolds number. When the dimensionless Power number was plotted as a function of the Reynold number on a log-log scale, it was found that at Reynolds numbers $> 1{,}000$, the dimensionless power number was constant for the square and cylindrical baffled tanks. Coagulation-flocculation experiments with mainly domestic sewage of the village of Bennekom indicated that the coagulation-flocculation performance for the removal of colloidal compounds at the same G value differed slightly with the stirrer type and type of vessel applied. The optimal G value was the same for all vessel-stirrer combinations. (McKeon-FRC)

UTILISATION, TREATMENT AND DISPOSAL OF DISTILLERY WASTEWATER,
Queensland Univ., Brisbane (Australia). Dept. of Chemical Engineering.
G. J. Sheehan, and P. F. Greenfield.
Water Research, Vol 14, No 3, p 157-277, March, 1980. 1 Fig, 9 Tab, 150 Ref.

Descriptors: Reviews, *Waste water treatment, Fertilizers, *Fermentation, Yeasts, *Alcohols, *Filtration, Biological treatment, Recycling, *Waste water disposal, Biomass, Nitrification, Denitrification, Sewage lagoons, Anaerobic digestion, Sludge treatment, Waste treatment, Activated sludge, Cultures, Trickling filters, Byproducts, Municipal wastes, Profit, Costs, Agriculture, Irrigation programs, Deep wells, Aquatic ecosystems, Toxicity, Environmental effects, Sewage effluents, *Distillery waste water.

Methods used in the treatment of distillery wastewater are reviewed. Distillery wastewater is usually comprised of a high volume of greatly acidic matter which presents many disposal and treatment problems. Waste streams generally contain high levels of both dissolved organic and inorganic materials. There has been increasing interest in the use of ethanol from biomass as a liquid fuel alternative. Ethanol fermentation is examined in relation to distillery wastes. Reducing the volume of wastes may be accomplished by fermenting higher strengths of molasses. Raw stillage discharge has a highly deleterious effect on fish life. Stillage has been proposed for use as a fertilizer, food supplement, biomass production agent, animal feed, and potash source. Physical-chemical treatment of stillage has met with little success. Anaerobic digestion, anaerobic filters, lagoons, activated sludge, trickling filters and rotating biological contactors have all been successfully applied to the treatment of stillage waste water. Pilot and full scale data is also available on the combined treatment of municipal wastes and stillage wastes. NaNO3 addition to stillage in shallow lagoons, followed by denitrification, has also been tried. (Geiger-FRC)

INVESTIGATION TO REPLACE THE CONVENTIONAL SEDIMENTATION TANK BY A MICROSTRAINER IN THE ROTATING DISC SYSTEM,
Stuttgart Univ. (Germany, F.R.). Inst. fuer Siedlungswasserbau und Wasserguetewirtschaft.
P-S. Cheung, K. Krauth, and M. Roth.
Water Research, Vol 14, No 1, p 67-75, January, 1980. 7 Fig, 6 Tab, 16 Ref.

Descriptors: *Waste water treatment, *Microstrainers, *Settling basins, *Suspended solids, Biological treatment, Filters, Rotating disc system, Effluents, Weather, Separation techniques, Tertiary treatment.

The efficiency of a microstrainer to remove suspended solids (SS) from the effluent of a rotating disc system was studied. The microstrainer (filter medium: polyester fiber fabric; filter surface area: 1.17 sq m) and a conventional sedimentation tank (surface area: 64 sq m) were run in parallel to compare the removal rates of each. Under dry weather flow conditions, the microstrainer removed about 95% of SS, achieving an effluent with about 8 mg/liter SS at a surface loading rate of up to 20 m/hr. The ability of the microstrainer to remove SS under wet weather flow conditions was slightly lower but still fell within acceptable limits. The microstrainer failed to effectively remove SS from the effluent of a partially treated biological system. Direct comparison between the efficiency of the microstrainer and of the conventional sedimentation tank showed that it was justified for the former to replace the latter in a rotating disc system with complete biological treatment. STANDING PROUD. CONSISTENCY SPELLS SUCCESS AT SALT CREEK,
Salt Creek Drainage Basin Sanitary Dept., Villa Park, IL.
F. Dole, and J. Crosby.
Water and Sewage Works, Vol 127, No 10, p 18, 49, October, 1980. 2 Fig, 2 Ref.

Descriptors: *Treatment facilities, *Waste water treatment, *Sludge treatment, *Anaerobic digestion, Sludge, Dewatering, Drying, Aeration, Separation techniques, Sand, Filtration.

The wastewater treatment plant at Salt Creek, Illinois, is described. The plant effluent averages 1.48 mg/liter suspended solids and 1.79 mg/liter BOD, according to 1979 records. The activated sludge plant treats an average flow of 3 mgd. About 90% of the flow is domestic in nature. Raw sludge is pumped into one or two primary anaerobic digesters once or twice daily. For drying and dewatering there are 12 sand drying beds available and a belt filter press. An average of 25,000 gal/wk of sludge is pumped from the secondary digester to the sand drying beds or the belt filter press. At least an equivalent amount of supernatant is produced. Good liquid-solid separation is achieved in the secondary anaerobic digesters. Liquid drawn from secondary digesters is returned directly to the preaeration tanks, with the effluent going directly into the primary clarifiers. The return is at the rate of about 20 gpm. The supernatant is aerated with 2-3 ppm dissolved oxygen upon returning it to the primary treatment units. Close monitoring of raw sludge pumping, consistent temperatures throughout primary digesters, and consistent sludge drawoffs from the secondary digesters have produced the well-digested sludge reported at this plant. ROTATING DISC SEWAGE TREATMENT SYSTEM FOR SUBURBAN DEVELOPMENTS AND HIGH-DENSITY RESORTS OF HAWAII,
Hawaii Univ., Honolulu. Water Resources Research Center.
G. T. Griffith, R. H. F. Young, and M. J. Chun.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-138349, Price codes: A05 in paper copy, A01 in microfiche. Project Completion Report, Technical Report No 116, May, 1978. 72 p, 22 Fig, 19 Tab, 43 Ref, 1 Append. OWRT-A-068-HI(2), 14-34-0001-7025.

Descriptors: *Sewage treatment, *Suburban areas, *Municipal wastes, *Hawaii, *Design criteria, Treatment, Waste treatment, Research and Development, Potential flow, Suspended solids, Wastes, Biochemical oxygen demand, Waste water(Pollution), Water Quality control, Water quality, Sewage systems, Sewerage, Sewage sludge.

Testing of this large-scale pilot rotating disc treatment system was carried out at the Honolulu Pacific Palisades Municipal Wastewater Treatment Facility to determine its treatment effectiveness and to provide design/operation criteria in domestic waste water treatment in Hawaiian/tropical climates. The system included primary clarification and sludge storage facilities, and a 1.8-foot disc diameter 225 sq ft four-stage rotating disc treatment unit. The test unit, evaluated at four hydraulic loadings (2.25-6.7) gallons per day per sq ft, achieved overall removal of carbonaceous BOD-5 and suspended solids of 94-82 and 96-82% when treating degritted raw domestic waste water. Peripheral rotational disc speed was held constant (1.0 foot per second) and waste water temperature of 27-28 degrees was used for the study. The disc section produced 0.40-0.50 mass units sludge per mass unit BOD-5 removed in the disc section. Installed rotating disc package systems treating sewage volumes of 25,000 and 100,000 gallons per day were estimated to be about 10% higher than for extended aeration and high-rate activated sludge package systems, but total annual cost over a 20-year period would be about 14 and 20% lower than these systems, respectively. (Zielinski-IPA)
W81-00801

INFLUENCE OF FULVIC ACID ON THE REMOVAL OF TRACE CONCENTRATIONS OF CADMIUM(II), COPPER(II), AND ZINC(II) FROM WATER BY ALUM COAGULATION,
New Hampshire Univ., Durham. Dept. of Chemistry.
R. E. Truitt, and J. H. Weber.
Water Research, Vol 13, p 1171 to 1177, 1979. 4 Tab, 33 Ref, OWRT-B-004-NH(5), 14-34-0001-8132.

Descriptors: Copper, Cadmium, Zinc, *Fulvic acid, *Water treatment, Ions, Water pollution, *Trace elements, *Coagulation, Separation techniques, Trace metals, *Alum coagulation, Metal ion removal, Coagulants.

The effectiveness of Cu sup 2+, Cd sup 2+ and Zn sup 2+ removal form solution by alum coagulation was measured with fulvic acid present and absent. A factorial experimental design and analysis of variance were used to determine the effect on metal ion removal of the individual variables pH, metal ion concentration, alum concentration and fulvic acid concentration and their combinations. The variable levels model water treatment plant conditions. Metal ion losses up to 96% for Cu sup 2+, 59% for Cd sup 2+ and 82% for Zn sup 2+ were measured in the preence of fulvic acid. In its absence the maximum metal ion losses observed were 93%, 14% and 53% for Cu sup 2+, Cd sup 2+ and Zn sup 2+, respectively. Fulvic acid enhances metal ion removal under most experimental conditions. The practical implication of the results is that strong complexes between natural water organic matter and metal ions enhance their removal by the alum coagulation process.

A FEW THOUGHTS ON WASTE,
National Building Research Inst., Pretoria (South Africa).
R. C. Jones.
The Certified Engineer (Johannesburg), Vol 52, No 3, p 382-386, March, 1979.

Descriptors: *Pollution abatement, *Waste disposal, *Management, *Optimization, *Social aspects, Technology, Methodology, Soil conservation, Waste dumps, Waste treatment, Water conservation, Water consumption, Water pollution control, Energy, Recycling, Rainfall, Desalination, Winds, Tides, Hydrogen, Hydroelectric power, Stream, Animal population, Vegetation, South Africa.

A challenge is presented to every one to decrease waste, recycle material, use what materials are available wisely and conserve what we have. A decrease in waste is economically feasible if it is applied correctly such as where refuse from one plant's operation is used as the raw material for another. Water recycling and conservation is particularly critical in South Africa because consumption will surpass the amount of rainfall by 1986. More water can be obtained by desalination of seawater and purification of effluent water by plants such as the water hyacinth. The nutrients in the soil must be maintained and the amount of gaseous wastes decreased in the air. New and old sources of energy must be found and rediscovered such as hydrogen, hydroelectric power, stream, sunlight, wind, tides, and lightening. Indigenous animal populations which are good protein producers should be fully exploited. The potential for human ingenuity and talent development remains the key to responsible waste management and a productive society. (Sidney-IPA)

PERFORMANCE OF AEROBIC DIGESTION AT DIFFERENT SLUDGE SOLID LEVELS AND OPERATION PATTERNS,
Toronto Univ. (Ontario). Dept. of Civil Engineering.
J. Ganczarczyk, M. F. Hamoda, and H-L. Wong.
Water Research, Vol 14, No 6, p 627-633, June, 1980. 9 Fig, 3 Tab, 18 Ref.

Descriptors: *Activated sludge, *Suspended solids, *Laboratory tests, *Sludge digestion, Aerobic digestion, Volatility, Sewage treatment, Continuous flow, Biological treatment, Operations, Waste water treatment, Degradation, Sludge treatment.

Laboratory batch and semi-continuous experiments were conducted to clarify the relationship between the digestion performance and the level of solids in the aerobic digestion process, to study the operation patterns of aerobic digestion, and to compare the effectiveness of aerobic digestion of both the primary sewage sludge and the waste (excess) activated sludge. Aerobic digestion of primary sludges and waste secondary activated sludges was carried out at 20 degrees with solids concentrations of 60,000 milligrams/liter and 20,000 milligrams/liter, respectively. Results showed that aerobic digestion of more concentrated sludges was associated with slower solids degradation rates. However, in the range of concentrations tested, the more concentrated sludges yielded greater masses of volatile suspended solids decomposed per unit digester volume per day. The amounts of volatile suspended solids decomposed per unit digester volume per day were similar for the primary and secondary sludges with the same volatile suspended solids concentration. Results of batch digestion tests were not directly applicable to the design of continuous flow aerobic digesters. It was also found that sludge treatment by a higher level of solids could be used to obtain a more stabilized sludge product. (Geiger-FRC)

FLOC-FORMING SUBSTANCES EXTRACTED FROM ACTIVATED SLUDGE BY SODIUM HYDROXIDE SOLUTION,
Gifu Coll. of Pharmacy (Japan). Dept. of Environmental Hygiene.
T. Sato, and Y. Ose.
Water Research, Vol 14, No 4, p 333 to 338, April, 1980. 1 Fig, 5 Tab, 37 Ref.

Descriptors: *Activated sludge, *Sewage bacteria, *Flocculation, *Separation techniques, *Chemical analysis, Proteins, Carbohydrates, Metals, Hydrogen ion concentration, Spectrophotometry, Analytical techniques, Sodium hydroxide, Slime, Viscosity, Gas chromatography, E. coli.

The viscous substance which has been implicated as the cause of floc formation in activated sludge

and is produced by sludge bacteria was extracted from activated sludge with 2 N and 0.1 N NaOH solutions by a modified method of Tezuka. The resultant NaOH extracts flocculated kaolin and E. coli suspensions at pH values below 3. Substances extracted from E. coli with 2 N NaOH solution did not flocculate the suspensions of kaolin in any pH range. The 2 N NaOH extract yielded 4.55%, while the 0.1 N NaOH extract yielded 1.12% of viscous substance. The chemical compositions of these extracts were determined after elemental and gas chromatographic analyses and tests for protein, carbohydrates, RNA, DNA, and sugars. Paper chromatography, color reactions of uronic acid, and determinations of metals in the ash by atomic absorption emission spectrophotometry were also carried out. Results showed that extracts contained protein, carbohydrates, nucleic acids and ash. The carbohydrate components contained the sugars arabinose, mannose, galactose, glucose, amino sugar and a few other sugars. Among the 11 metals found in the sludge extracts, Na, Fe, Ca, and K were present in larger amounts. (Geiger-FRC)

STUDIES ON THE USE OF INORGANIC GELS IN THE REMOVAL OF HEAVY METALS,
Roorkee Univ. (India). Dept. of Chemistry.
S. K. Srivastava, G. Bhattacharjee, A. K. Sharma, and C. K. Oberoi.
Water Research, Vol 14, No 2, p 113-115, February, 1980. 3 Fig, 1 Tab, 7 Ref.

Descriptors: *Waste water treatment, *Heavy metals, *Gels, Separation techniques, Ion exchange, Sorption, Iron, Cobalt, Zinc, Silver, Cadmium, Mercury, Thallium, Inorganic compounds.

Investigations are reported on the sorption and recovery of some heavy metal ions on columns using inorganic gels as exchanger material. Chromium ferrocyanide gel demonstrated a great affinity for Ag, Cu, Tl, Zn, Co, Cd, Mn, and Fe ions. The only drawback seen to using this type of column is the limited recovery of only a few metal ions such as cobalt, cadmium, manganese, zinc and lead. Silver and copper are irreversibly taken up. Even so, the method can be used to separate these metal ions from waste water in the presence of other salts and high acidity. (Baker-FRC)

FULL-SCALE PHYSICAL-CHEMICAL-BIOLOGICAL TREATMENT OF TEXTILE WASTEWATERS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
C. W. Randall, and P. H. King.
Progress in Water Technology, Vol 12, No 3, p 231-238, 1980. 4 Fig, 4 Tab.

Descriptors: *Biological treatment, *Aeration, *Industrial wastes, *Textiles, Waste water treatment, Chemical oxygen demand, Biochemical oxygen demand, Suspended solids, Color, Sludge, Water purification, Water pollution, Organic compounds, Aeration lagoons.

The treatment of textile wastewaters by three full-scale plants was compared. Plant A was the simplest of the three plants; it consisted of only an extended activated sludge system plus sand drying beds. Plants B and C both had biological and chemical processes, with plant B placing the chemical system first and plant C placing the biological system first. Results showed that biological processes alone produced an inferior quality effluent in terms of organic matter, suspended solids, color, and total phosphorus. The best effluent in terms of biochemical oxygen demand (BOD) and total suspended solids (TSS) was plant C; however, plant B had a lower chemical oxygen demand (COD) and a lower color. Most of the BOD, but less than half of the COD and color were removed by the biological treatment of planct C. In plant B, less than 20% of the COD but over 90% of the color was removed by the biological processes. Both plants B and C had biological processes which increased the TSS. Plant B proved to be the most trouble-free operation, while plant C effected the highest removals of all wastewater constituents. (Geiger-FRC)

THE EFFECT OF PLANT CONFIGURATION ON SLUDGE BULKING,
Water Pollution Research Lab., Stevenage (England).
M. J. D. White, E. J. Tomlinson, and B. Chambers.
Progress in Water Technology, Vol 12, No 3, p 183-188, 1980. 4 Fig, 6 Ref.

Descriptors: *Activated sludge, *Settling velocity, *Mixing, Pilot plants, Aeration, Biological treatment, Dispersion, Kinetics, Model studies, Sedimentation, Microorganisms.

Many different factors control the performance of an activated sludge system. Two aspects of process design which may be employed to improve the settling properties of activated sludge, anoxic mixing and longitudinal mixing, were investigated in pilot studies and full-scale activated sludge aeration tanks. The incorporation of an anoxic mixing stage into the aeration tanks of conventional nitrifying activated sludge plants caused improvements in sludge settlability, which were attributed to a reduction in longitudinal mixing as well as the introduction of an anoxic environment. Chemical and radioactive tracer studies have shown that the degree of longitudinal mixing could be expressed as a dimensionless Dispersion Number. A correlation was noted between the Dispersion Number and the settling characteristics of the activated sludge, which was expressed as the Stirred Specific Volume Index. Sludges with better settling properties were produced by aeration tanks with lower Dispersion Numbers, because in tanks with higher Disperion Numbers, conditions of complete mixing were simulated. FLOC SIZE, FILAMENT LENGTH AND SETTLING PROPERTIES OF PROTOTYPE ACTIVATED SLUDGE PLANTS,
Georgia Inst. of Tech., Atlanta, GA.
M. Sezgin, D. Jenkins, and J. C. Palm.
Progress in Water Technology, Vol 12, No 3, p 171-182, 1980. 5 Fig, 6 Tab, 7 Ref.

Descriptors: *Flocculation, *Activated sludge, *Model studies, *Settling velocity, Prototype tests, Microorganisms, Sewage bacteria, Biological treatment, Theoretical analysis, Laboratory tests, Waste water treatment, Sewage treatment.

The applicability of the relationship between total extended filament length and the settling characteristics of activated sludge to operating prototype treatment units was determined. The hypothesis that floc sizes in laboratory activated sludge units are smaller than in prototype units was also examined. Activated sludges from twelve California sewage treatment plants were used in the experiments. Results showed that settling properties of the activated sludge of full-scale plants after evaluation of reflocculation time, zone settling velocity, height of the 60-minute compact volume and sludge volume index were related to the total length of filamentous microorganisms using previous relationships developed for laboratory activated sludge units. In full-scale plant studies, the amount of filaments extending from the flocs had the greatest influence on settling properties of the activated sludge in both purely domestic and partially industrial sewage. No difference was observed in the mean maximum floc dimension between full-scale and laboratory-scale activated sludge treatment systems. (Geiger-FRC)

WASTE WATER FROM A CHEMICAL-PHARMACEUTICAL WORKS,
Boehringer, Mannheim (Germany, F.R.).
N. Reus, and H. Rueffer.
Progress in Water Technology, Vol 12, No 3, p 153-169, 1980. 11 Tab, 8 Ref.

Descriptors: *Biological treatment, *Industrial wastes, *Toxins, *Activated sludge, *Sewage bacteria, Waste water treatment, Water pollution, Sewage treatment, Chloroform, Solvents, Pilot plants, Organic compounds, Carbon tetrachloride, Nitrate.

The Boehringer Mannheim pharmaceutical company, which had formerly discharged about 40% of its wastewater into the Rhine River, was required in 1973 to discharge its wastes into a newly constructed municipal sewer. To reduce the load of oxidizable and noxious substances before discharge, several experiments were performed by the company to ascertain that effluents would not harm bacterial populations or sewer components. An adapted activated sludge was employed which was found to yield good biodegradability when mixed with sewage. The adapted sludge also functioned well in the presence of high levels of chloroform. All chlorinated hydrocarbons and solvents were decomposed by treatment processes in pilot plant tests. Step-by-step discharge of wastes was begun into the sewer in 1978 with no breakdown having occurred in the system up to the present time. The adapted sludge tolerated chloroform contents greatly in excess of acceptable toxicity levels. Controlled natural selection of sludge bacteria was also geared to handle carbon tetrachloride, methanol, nitrate and other toxic solvents. (Geiger-FRC)

COMPARISON OF COSTS OF FOUR MODIFICATIONS OF THE ACTIVATED SLUDGE PROCESS: AN EXAMPLE CASE,
Technische Hochschule, Vienna (Austria). Inst. fuer Wasserversorgung Abwasserreiningung und Gewasserschuts.
W. Floegl.
Progress in Water Technology, Vol 12, No 3, p 139-151, 1980. 8 Fig, 5 Tab, 5 Ref.

Descriptors: *Biological treatment, *Activated sludge, *Comparative costs, *Operating costs, Waste water treatment, Sludge digestion, Biochemical oxygen demand, Density, Human populations, Sewage treatment, Model studies, Theoretical analysis, Systems analysis, Annual equivalent costs.

Difficulties often arise in comparing costs of existing waste water treatment plants because of such external factors as location, overall economic situation of construction, plant equipment, safety features, and means of financing. To obtain a more objective comparison, four modifications of the activated sludge process with BOD5 effluents of less than or equal to 20 milligrams/liter were examined. The plant sizes covered population equivalents ranging from 50,000 to 500,000. The four modifications were: a one-stage activated sludge plant (a.s.p.) with primary treatment and sludge digestion; a one-stage a.s.p. without primary treatment, with sludge digestion; a one-stage a.s.p. without primary treatment, with simultaneous aerobic sludge stabilization; and a two-stage a.s.p. without primary treatment, with sludge digestion. Estimates were based on single cost positions to exclude external factors. Least expensive total annual costs were found with the one-stage type operation without primary treatment. Using a primary treatment alternative caused slight cost increases. Higher costs also occurred with an alternative with simultaneous aerobic stabilization and a two-stage alternative. (Geiger-FRC)

PRELIMINARY STUDIES ON COMBINED OR SEPARATE TREATMENT (AS EXPERIENCED WITH EFFLUENTS FROM INDUSTRIES PROCESSING WOOD),
Technische Hochschule, Vienna (Austria). Inst. fuer Wasserversorgung Abwasserreiningung und Gewasserschuts.
H. Fleckseder.
Progress in Water Technology, Vol 12, No 3, p 129-138, 1980. 13 Ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Pulp and paper industry, *Cost analysis, *Theoretical analysis, Industrial wastes, Mathematical studies, Pulp wastes, Cost comparisons, Economics, Systems analysis, Model studies, Design, Wood wastes.

Qualitative and quantitative comparisons were made of five Austrian effluent treatment plants to evaluate the cost effectiveness and efficiency of the separate or combined approach to treatment of sewage and industrial effluents. One of the plants treated a fiberboard mill effluent, while the other four handled pulp mill effluents. The expected loads to each plant were assessed, and preliminary designs on connecting sewers were drawn up. Cost estimates were calculated, taking into account such variables as future plant expansions, urban development, and possible alternate discharge locations. It was recognized from these five cases that the appropriateness of combined or separate treatment of industrial wastes cannot be generalized and must take into account such individual factors as plant designs, management structures, topography, discharge schedules and regionalization. Although all five study sites favored combined treatment, it was suggested that cost evaluations be made for each individual plant under consideration. (Geiger-FRC).

INFLUENCE OF PHASE SEPARATION ON THE ANAEROBIC DIGESTION OF GLUCOSE-I. MAXIMUM COD-TURNOVER RATE DURING CONTINUOUS OPERATION,
Amsterdam Univ. (Netherlands).
A. Cohen, A. M. Breure, J. G. Van Andel, and A. Van Deursen.
Water Research, Vol 14, No 10, p 1439-1448, October, 1980. 7 Fig, 5 Tab, 41 Ref.

Descriptors: *Anaerobic digestion, *Chemical oxygen demand, *Fermentation, *Anaerobic bacteria, Sludge, Lipids, Separation techniques, Waste water treatment, Organic compounds, Acids, Sewage bacteria, Carbohydrates, Glucose.

An anaerobic digestion of a mineral medium containing 1% glucose was carried out in either one or two phases under similar conditions. The one-phase digestion system was comprised of an anaerobic up-flow with acidogenic and methanogenic populations to effect complete conversion of the carbon source into gaseous end products and biomass. The two-phase digestion system was composed of both an acid and a methane reactor in a series to permit sequential glucose acidogenesis and methanogenesis. Carbon mass balance was used to evaluate performance of the one-and-two-phase systems. Maximum turnover of COD was calculated by gradually increasing the feed supply of both systems. In the two-phase digestion process, maximum specific sludge loadings of the methanogenic phase were over 3 times greater than in the one-phase digestion system. In other experiments overloading was simulated with accumulation of volatile fatty acids. Propionate and acetate were formed in large quantities in the one-phase system, while accumulation of several fatty acids occurred in the two-phase system. After cessation of feed supply, only propionate remained in the one-phase system after one week and all fatty acids in the two-phase system were rapidly converted. The ecological and physiological importance of phase separation is also considered. (Geiger-FRC)

TRENDS IN COASTAL WASTE TREATMENT,
WAPORA, Inc., Chevy Chase, MD.
L. W. Olinger, and J. I. Bregman.
Progress in Water Technology, Vol 12, No 1, p 211-223, 1980. 4 Fig, 7 Ref.

Descriptors: *Monitoring, *Water pollution sources, *Waste water treatment, *Estuarine environment, *Sea water, Coasts, Costs, Regulation, Sewage effluents, Water quality, Sewage treatment.

American experiences in coastal water treatment are discussed, and their applicability to problems in the Mediterranean are briefly considered. The characteristics of estuarine and near-shore waters are presented including: tides, salinity, density, stratification, winds, bathymetry, and ecology. US laws and regulations which apply to waste water treatment facilities discharging into coastal areas are summarized. Advanced facilities of this type are described including water quality problems, annual or projected improvements in water quality, cost of the facility, and the economic impact of the facility on its users . The use of ocean outfalls for effluent disposal is examined including system design and effectiveness. Detailed water quality and biological studies of the receiving waters are recommended before construction of a costly advanced waste water treatment plant. A secondary treatment plant could be constructed on the site and monitored to see if this level of treatment is sufficient. Environmental monitoring programs should be used throughout the planning and treatment stages. (Small-FRC)

CONTROLLING ORGANIC COMPOUNDS IN WATER - BY TREATMENT,
T. Burke.
Water, No 34, p 17-19, September, 1980. 3 Fig, 3 Tab.

Descriptors: *Organic compounds, *Activated carbon, *Tertiary treatment, *Drinking water, *Adsorption, *Waste water treatment, Disinfection, Chlorination, Chlorinated hydrocarbon pesticides, Sewage treatment, Ozone, Public health, Costs, Water pollution treatment.

Possible health effects of synthetic organic compounds (SOC) in drinking water have necessitated changes in water treatment policies. The US EPA has passed laws limiting the level of trihalomethanes (THM) in drinking water to 0.10 milligrams/liter, and has required vulnerable utilities to install granular activated carbon (GAC) treatment processes. A variety of guidelines for safe levels of THMs in drinking water have been set by other nations. Control measures for limiting the level of SOCs and THMs in drinking water are reviewed. Studies in the United Kingdom were conducted to determine at which step of the treatment process efforts to limit THM formation should be concentrated. Alternatives to chlorine disinfection include ozonation and the use of chlorine dioxide. Flow diagrams are presented for typical GAC systems in a slow sand filtration plant and a chemical coagulation plant. The importance of selecting the correct carbon in treating different waters, and the costs of GAC absorption operations are considered. Research on SOC removal at the Water Research Center of the United Kingdom consists of desk, laboratory, and field studies. There remains no low cost solution to the removal of organic micropollutants in drinking water. Studies are also being conducted to ascertain the effects of low levels of organics in a variety of toxicity tests and epidemiological studies. (Geiger-FRC)

THE SECOND STAGE TREATMENT OF BIOLOGICALLY TREATED COAL CARBONIZING WASTES IN ADMIXTURE WITH SEWAGE,
Yorkshire Water Authority, Sheffields (England). Southern Div.
H. B. Tench.
Progress in Water Technology, Vol 12, No 3, p 221-230, 1980. 6 Tab, 2 Ref.

Descriptors: *Color, *Industrial wastes, *Sewage treatment, *Biological treatment, Waste water treatment, Rivers, Water pollution, Activated sludge, Mathematical studies, Model studies, Nitrification, Aeration, Adsorption, Water quality, Phenols, Iron compounds.

The further treatment of biologically treated coal carbonizing wastes by discharge to sewers was investigated in laboratory and full-scale tests. Carbonizing wastes were handled in admixture with sewage at levels of up to 20% in one aeration unit. Satisfactory performance was achieved if a sodium hydrogen carbonate buffer was added to increase the level of nitrification. Complex phenols produced a color in the carbonizing wastes which was not removed at the 20% additions. Ferric chloride treatment significantly removed the color in the effluent while serving as a sludge conditioner. When flocs occurred in the presence of the iron compound, most of the color was taken out by adsorption onto floc surfaces. Consent conditions for the discharge of the treated effluent by admixture with sewage established by the South Yorkshire Water Authority were aimed at permitting the survival of coarse fish. A simple mathematical model was proposed to calculate standards for discharge to a river or sewer. (Geiger-FRC)

ACTIVATED SLUDGE CONTROL IN THE SECONDARY SETTLING BASIN USING THE SLUDGE SETTLING ANALYZER,
Kanazawa Univ. (Japan). Dept. of Construction and Environmental Engineering.
S. Matsui, and N. Furuya.
Progress in Water Technology, Vol 12, No 3, p 213-220, 1980. 7 Fig, 1 Tab, 3 Ref.

Descriptors: *Activated sludge, *Instrumentation, *Mathematical models, *Settling basins, *Equations, Analytical techniques, Municipal wastes, Model studies, Waste water treatment, Monitoring, Overflow, Suspended solids, Automation.

A new instrument, the settling sludge analyzer, which was developed to monitor the settling interface of sludge and analyze sludge settling curves is described. The instrument was used to compute sludge volumes in the secondary settling basin according to a new mathematical model based on two previous theories. The sludge settling analyzer was applied to small and large size municipal waste water treatment facilities. Calculations produced by the new instrument gave good agreement with actual sludge volumes in the secondary settling basins. The sludge settling analyzer also computed relations among concentration of return sludge, MLSS, SVI, and overflow rate of the secondary basin based on the new formula and measurements of the sludge settling interface. The relations were found to be useful in predicting operating criteria for overflow rate, design, return sludge ratio, the level of MLSS in the activated sludge system and excess sludge withdrawal. INVESTIGATIONS ON THE PERFORMANCE OF UPFLOW FINAL SETTLING TANKS IN ACTIVATED SLUDGE PLANTS,
Technische Univ., Munich (Germany, F.R.). Lehrstuhl und Pruefamt fuer Wasserguetewirtschaft und Gesundheitsingenieurwesen.
H. Resch.
Progress in Water Technology, Vol 12, No 3, p 201-211, 1980. 7 Fig, 1 Tab, 13 Ref.

Descriptors: *Activated sludge, *Settling basins, *Settling velocity, *Biological treatment, *Separation techniques, Sludge treatment, Pilot plants, Waste water treatment, Flocculation, Sewage treatment, Suspended solids, Effluents, Sedimentation, Structural shapes, Design, Germany.

In Germany, wastewater treatment processes characteristic of sludge blanket clarifiers are not considered, due to a preference for funnel-shaped final settling tanks with vertical upflow and 30% higher surface loadings. Activated sludge plants in Bavaria and Berlin which use Dortmund tanks for final settling were studied for surface loading, sludge return rate and levels of activated sludge. These 3 parameters were varied to examine their effect on effluent quality and distribution of suspended solids in the tanks. Additional studies were conducted in tube-shaped pilot settling tanks of the Ismaning plant to determine the influence of wastewater temperature, inlet depth, maximum loadings and

maximum sludge return rates on settling tank efficiency. The high load capacity of the Dortmund tanks was clearly demonstrated, while the effluent quality of the funnel shaped tanks with sludge blankets occurred with increased sludge volume loading. Effluent quality in the Dortmund tanks remained good provided sludge levels did not reach the water surface. (Geiger-FRC)

TREATMENT OF A FILAMENTOUS INDUSTRIAL WASTE IN A MUNICIPAL STEP AERATION PLANT,
Greeley and Hansen, Chicago, IL.
T. E. Wilson, G. Lukasik, and D. Ogle.
Progress in Water Technology, Vol 12, No 3, p 189-199, 1980. 5 Fig, 2 Tab, 2 Ref.

Descriptors: *Activated sludge, *Aeration, *Industrial wastes, *Biological treatment, *Microorganisms, *Suspended solids, *Water pollution sources, Waste water treatment, Municipal wastes, Settling velocity, Domestic wastes, Nitrification, Flocculation, Regulated flow.

A 12 mgd wastewater treatment plant employing a two-step, air activated sludge, nitrification process experienced serious problems when the aeration tank hydraulic and clarifier loading rates were increased sharply over the course of a start-up. Reduced treatment capacity occurred due to an increased number of filamentous organisms contributed by the effluent of an industrial wastewater treatment plant. Over a five day period during the course of the upset, this industry produced over 75% of the total influent suspended solids; it normally accounted for about 45% of the influent suspended solids. Plant process stability was regained and maintained by alterations in the first carbonaceous step and the aeration tank flow. Plug flow with no reaeration was replaced by a pattern in which 3 or 4 of the aeration passes were used for return sludge reaeration. Plant observations and test results of initial settling velocity showed that the treatment capacity of the municipal plant was related to the solids loading of the industrial wastewaters. THE EFFECT OF INTERNAL MASS TRANSFER RESISTANCES ON THE INTERPRETATION OF SUBSTRATE REMOVAL DATA IN THE SUSPENDED GROWTH SYSTEM,
Dorr-Oliver Inc., Stamford, CT.
W. K. Shieh.
Water Research, Vol 14, No 6, p 695-699, June, 1980. 4 Fig, 1 Tab, 14 Ref.

Descriptors: *Activated sludge, *Continuity equation, *Mass transfer, Theoretical analysis, Model studies, Kinetics, Flocculation, Mathematical studies, Separation techniques.

Suspended growth systems such as the activated sludge process are usually heterogeneous and autocatalytic, producing their own enzymes. A technical note is presented to theoretically demonstrate the significance of internal mass transfer resistances on the interpretation of the kinetic data of such systems. To examine these effects by the concept of an effectiveness factor, steady state conditions, simple soluble substrate, spherical microbial flocs with uniform size and composition, insignificant external mass transfer resistances and Monod kinetics were assumed. Three linearized plots used to evaluate kinetic constants were examined under cases of low and high ambient substrate concentrations. Large microbial floc conditions and low ambient substrate levels had a significant effect on the observed rate of the activated sludge process. The saturation utilization rate (k) in the Monod equation was not affected by internal mass transfer limitations when the Eadie-Hofstee and Lineweaver-Burk plots were used to determine kinetic parameters. Under the activated sludge suspended growth system, the three plots examined were not very sensitive to the effects of internal mass transfer resistances. (Geiger-FRC)

FIELD INFILTRATION AS A METHOD FOR THE DISPOSAL OF OIL-IN-WATER EMULSIONS FROM THE RESTORATION OF OIL-POLLUTED AQUIFERS,
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Versuchsanstalt fuer Wasserbau, Hydrologie und Glaziologie.
H-O. Schiegg.
Water Research, Vol 14, No 8, p 1011-1016, August, 1980. 8 Fig, 1 Tab, 14 Ref.

Descriptors: *Potable water, *Aquifers, *Infiltration, *Oil spills, Water pollution, Retention, Model studies, Groundwater, Microbial degradation, Pumping, Path of pollutants, Emulsions, Jamin effect.

When oil accidents occur it becomes important to prevent permeation of the oil into aquifers that are used as potable water supplies. The use of water pumping to prevent the propagation of oil during a spill may result in oil-water emulsions with low oil content. Field infiltration of oil-water emulsions is often performed, with retention of oil by soil or its degradation by soil microbes. Field infiltrations use smaller amounts of fresh water than those required during pumping. It is also a simplistic and inexpensive technique. The major drawbacks of field infiltration are the uncertainty surrounding retention and the degree of microbial degradation of oil. The maximum retention capacity of oil due to the Jamin effect was investigated experimentally. Some hydromechanical principles of field infiltration by oil-water emulsions were also examined. The retention capacity for oil during infiltration of an oil-in-water emulsion at gravity flow rates was calculated to be definitely greater than the pendular saturation. The drop in the relative permeability of the wetting fluid was estimated to be even steeper after the retention of the non-wetting fluid by the Jamin effect than it was after a displacement. DISSOLVED AIR FLOTATION IN HOT WATER,
Department of Scientific and Industrial Research, Petone (New Zealand). Industrial Processing Div.
W. T. Shannon, and D. H. Buisson.
Water Research, Vol 14, No 7, p 759-765, July, 1980. 9 Fig, 2 Tab, 13 Ref.

Descriptors: *Flotation, *Thermal water, *Waste water treatment, Bubbling, Geothermal studies, Water pollution, Flocculation, Temperature, Iron, Dissolved oxygen, Industrial wastes, New Zealand.

The use of dissolved air flotation (DAF) in the treatment of hot geothermal wastewater and other hot industrial effluents was evaluated in an experimental rig at 50-90 degrees. The efficiency of air dissolution (by spraying water over proprietary packing), bubble size distributions, and the air-solids ratios necessary for iron floc flotation were similar at 80 degrees to values observed at ambient temperatures. Costs for the DAF saturation process were estimated to be comparable to those for ambient temperature systems due to reduced viscosity and density of the water at higher temperatures and increased water vapor pressures above 65 degrees. Tests on iron flocs yielded an 80% removal efficiency, which would be satisfactory in geothermal work at Wairakei, New Zealand. Bubble rise rates at 80 degrees were found to be three times faster than at 20 degrees. The onset of severe bubble coalescence at 80 degrees took place at air dissolution pressures above 350 kPa. APPLICATION OF WATER EXTRACT OF BROWN COAL FLY ASH TO PHOSPHATE PRECIPITATION FROM POLLUTED WATERS,
Polish Academy of Sciences, Gdansk. Inst. of Hydraulic Research.
I. Kuziemska.
Water Research, Vol 14, No 9, p 1289-1293, September, 1980. 7 Fig, 4 Tab, 8 Ref.

Descriptors: *Chemical precipitation, *Phosphates, *Fly ash, *Coagulation, Alkalinity, Hardness, Suspended solids, Mathematical studies, Model studies, Municipal wastes, Waste water treatment, Eutrophication, Powerplants.

Brown coal fly ash taken from the Konin power plant was tested as a coagulant in a technique to precipitate phosphate from municipal wastes and strongly polluted water. Suspended solids were sedimented easily and improvements in BOD and COD were observed. A substantial amount of phosphate ion was precipitated immediately after the coagulant was introduced and after intensive mixing of the solution. Mathematical multiple regression models and experimental data have confirmed that the alkalinity and volume ratio of reacting waters and the total alkalinity of the tested water have the most significant influence on the degree of phosphate precipitation achieved. No effect on the process was found when reactant alkalinities in the range of 40 milliequivalent to 53 milliequivalent per liter were used. These two parameters enable 75% reliability in the prediction of phosphate ion precipitation from waters of known total hardness and alkalinity. (Geiger-FRC)

ON THE MECHANISM OF DEWATERING COLLOIDAL AQUEOUS SOLUTIONS BY FREEZE-THAW PROCESSES,
Columbia Univ., New York. Dept. of Chemical Engineering and Applied Chemistry.
G. Ezekwo, H-M. Tong, and C. C. Gryte.
Water Research, Vol 14, No 8, p 1079-1088, August, 1980. 7 Fig, 1 Tab, 40 Ref.

Descriptors: *Dewatering, *Sludge treatment, Freezing, Sewage sludge, Waste water treatment, Domestic wastes, Separation techniques, Crystallization, Analytical techniques, Solidification.

Freezing has been considered as an alternative to sludge dewatering and the conditions and extent to which the aqueous component in sludge can be solidified to ice were investigated. A partially digested sludge taken from the Coney Island Sewage Treatment Plant was subjected to a temperature gradient to -30 degrees. Crystal morphologies of freeze-dried samples were examined, thermal analyses were carried out, and water contents of drained gels were determined. Thermal analysis showed that about 50% water remained in the segregated solute matrix after freezing. Freezing of sludge resulted in the segregation of the solute, both dissolved and suspended, in a zone between the ice crystal domains. Dewatering was strongly dependent on retention of the form of the solute matrix during the melting process. To minimize the freezing time in potential freeze flocculation processes, the use of small particles was recommended. (Geiger-FRC)

NITROGEN TRANSFORMATIONS IN A SIMULATED OVERLAND FLOW WASTEWATER TREATMENT SYSTEM,
Louisiana State Univ., Baton Rouge. Lab. for Wetland Soils and Sediments.
R. L. Chen, and W. H. Patrick, Jr.
Water Research, Vol 14, No 8, p 1041-1046, August, 1980. 2 Fig, 6 Tab, 17 Ref

Descriptors: *Denitrification, *Nitrogen, *Model studies, *Overland flow, *Water purification, Nitrification, Municipal wastes, Industrial wastes, Waste water treatment, Adsorption, Nitrates, Nutrients, Water pollution.

Removal of pollutants by overland flow treatment has been suggested as an effective and economical technique for the purification of municipal and industrial waste water. It was proposed that a significant quantity of nitrogen could be removed by a properly planned nitrification-denitrification overland flow system. An overland flow test model was constructed to evaluate the efficiency of ammoniacal-nitrogen removal from waste water. Results showed removal of ammoniacal nitrogen, with the subsequent formation of nitrate. Radioactively-labeled nitrogen was used to examine nitrogen balance in the simulated overland flow system. Model studies revealed that the quantity of nitrogen removed depended upon denitrification rates. Nitrogen was absorbed by the soil, while applied ammoniacal nitrogen was assimilated by the vegetation. Ammoniacal nitrogen absorbed into the aerated soil surface mass underwent nitrification and was converted to oxidized forms of nitrogen. During subsequent wastewater applications, the nitrate diffused downward to the reduced zone, where some of it was denitrified to gaseous forms of nitrogen or was reduced to organic nitrogen by assimilation. The net loss of nitrogen which was observed in the overland flow system proved less than that predicted from non-labeled nitrogen mass balance estimations. (Geiger-FRC)

NITRIFICATION KINETICS IN ACTIVATED SLUDGE AT VARIOUS TEMPERATURES AND DISSOLVED OXYGEN CONCENTRATIONS,
Imperial Chemical Industries Ltd., Billingham (England). Dept. of Research and Development.
R. C. Charley, D. G. Hooper, and A. G. McLee.
Water Research, Vol 14, No 10, p 1387-1396, October, 1980. 8 Fig, 6 Tab.

Descriptors: *Nitrification, *Kinetics, *Activated sludge, *Dissolved oxygen, Model studies, Temperature, Domestic wastes, Sewage bacteria, Ammonia, Biochemical oxygen demand, Chemical reactions, Waste water treatment, Biological treatment.

Due to the growing concern over oxygen depletion by ammonia compounds in waste water, a study was undertaken to investigate the kinetics of nitrification under various temperatures and different levels of dissolved oxygen in activated sludge from a domestic sewage works. The effects of high concentrations of dissolved oxygen upon nitrifying bacteria were also studied in a 'Deep Shaft' effluent treatment process. The sludge was enriched with nitrifying bacteria by running a laboratory fermenter on ammonia supplemented sewage. Microbial nitrification kinetics were evaluated in respirometric studies. The reaction was found to be in agreement with the Michaelis - Menton model in the temperature range of 10-35 degrees. After acclimatization, high amounts of dissolved oxygen (38 milligrams/liter 02 at 30 degrees) had little effect on nitrification. However, the reaction was inhibited by nitrite levels in excess of 20 milligrams/liter. (Geiger-FRC)

MECHANISM AND KINETICS OF CYANIDE OZONATION IN WATER,
Amsterdam Univ. (Netherlands). Lab. of Chemical Technology.
J. A. Zeevalkink, D. C. Visser, P. Arnoldy, and C. Boelhouwer.
Water Research, Vol 14, No 10, p 1375-1385, October, 1980. 11 Fig, 4 Tab, 37 Ref.

Descriptors: *Ozone, *Mathematical studies, *Cyanide, *Oxidation, *Chemical reactions, Kinetics, Industrial wastes, Waste water treatment, Theoretical analysis, Laboratory tests.

The ozonation of potassium cyanide is of interest for its potential application in the treatment of cyanide bearing waste waters from industrial sources. The reaction has been studied in alkaline solutions buffered at a pH of 11.8 and a temperature of 20 degrees in a stirred tank reactor. The mass transfer parameters of the reactor have been determined by measuring the gas-liquid interfacial area and the physical mass transfer coefficient for different reaction condtions. Initial cyanide levels were about 100 grams/cubic meter. The reaction rate under these conditions may be described by an equation which is of first order with respect to ozone and independent of the levels of cyanide. Results of mass transfer studies showed that one mole of ozone oxidized one mole of cyanide; however, the reaction rate was so great that the conversion was limited by mass transfer. A reaction rate equation was predicted by the mechanism proposed for cyanide oxidation, and was supported by experimental data. The mechanisms proposed for the decomposition of ozone and the oxidation of cyanide were found to be similar. The kinetics proposed for the decay of ozone are in agreement with experimental data from the literature. (Geiger-FRC)

TYPE AND STRAIN DEPENDENCE OF ENTEROVIRUS ADSORPTION TO ACTIVATED SLUDGE, SOILS AND ESTUARINE SEDIMENTS,
Baylor Coll. of Medicine, Houston, TX. Dept. of Virology and Epidemiology.
C. P. Gerba, S. M. Goyal, C. J. Hurst, and R. L. LaBelle.
Water Research, Vol 14, No 9, p 1197-1198, September, 1980. 1 Tab, 10 Ref.

Descriptors: *Viruses, *Adsorption, *Sediments, *Activated sludge, *Separation techniques, Soils, Suspended solids, Sewage effluents, Sea water, Waste water treatment, Laboratory test, Water purification, Sewage sludge, Loam, Sewage treatment.

The adsorption of enteric viruses to solids is believed to play an important part in their removal during sewage treatment processes. A study was conducted to determine if quantitative differences existed in the adsorptive behavior of different types and strains of enteroviruses toward surfaces known to influence their distribution in nature. Viral suspensions containing 1 to 10 million plaque-forming units were added to 1 to 10 grams of solids (soil, activated sludge or sediments) in either distilled water, sewage effluent or sea water. Solid:liquid ratios were 1:1, 1:140, and 1:7 for soil, activated sludge and sediment, respectively. Suspensions were mixed and then centrifuged, and the supernatants were assayed for viral content and compared with solid-free control preparations. Adsorption to solids was found to be dependent on virus type as well as strain. Great variability was seen in viral adsorption to soil, while little variation was noted in viral adsorptive behavior on estuarine sediments. Viral adsorption to solids is known to depend upon isoelectric point of the virus, which varies in different viral types and strains. Isotherm data for soil and sediments has also revealed different viral adsorptive capacities in these materials. These findings suggest that the type of solids present during sewage treatment may greatly influence the viral removal capacity of the process. (Geiger-FRC)

BIOLOGICAL TREATMENT OF A COAL GASIFICATION PROCESS WASTEWATER,
Carnegie-Mellon Univ., Pittsburgh, PA. Dept. of Civil Engineering.
R. G. Luthy, and J. T. Tallon.
Water Research, Vol 14, No 9, p 1269-1282, September, 1980. 11 Fig, 5 Tab, 25 Ref.

Descriptors: *Industrial wastes, *Biological treatment, *Oxidation, *Organic compounds, *Waste treatment, Alkalinity, Waste water treatment, Chemical oxygen demand, Ammonia, Kinetics, Pilot plants, Sewage bacteria, Coal gasification waste water.

The efficiency of biological treatment on Hygas coal gasification process plant waste water was evaluated over an 8 month period. The waste water was composed of cyclone and quench condensates. The treatability of ammonia stripped and unstripped waste water at full strength and at 1:1 dilution was studied. The minimum pre-treatment needed for biological oxidation was calculated to consist of reducing the alkalinity and decreasing the raw ammonia level by dilution or stripping. Kinetic studies indicated that the waste water could be processed at mean cell residence times ranging from 10 to 40 days with 2 to 3 day hydraulic residence periods. The decay coefficient of Hygas wastes was 0.01/day, while the bacteriological yield coefficient was 0.10 on a chemical oxygen demand basis. Bacterial growth inhibition by Hygas waste water was attributed to short cell residence times. Although higher yield coefficients were achieved with diluted waste water, no problems with organic waste removal efficiencies were predicted under recommended processing parameters. (Geiger-FRC)
W81-00944

RESPONSE OF DISSOLVED OXYGEN TO CHANGES IN INFLUENT ORGANIC LOADING TO ACTIVATED SLUDGE SYSTEMS,
Vanderbilt Univ., Nashville, TN.
C. Y. Chen, J. A. Roth, and W. W. Eckenfelder, Jr.
Water Research, Vol 14, No 10, p 1449-1457, October, 1980. 8 Fig, 2 Tab, 14 Ref.

Descriptors: *Activated sludge, *Dissolved oxygen, *Organic compounds, *Biochemical oxygen demand, *Chemical oxygen demand, Monitoring, Respiration, Laboratory tests, Mathematical studies, Equations, Aeration, Model studies, Waste water treatment.

Responses of activated sludge to transient organic loadings and the effects of dissolved oxygen (DO) levels and oxygen uptake rates as control variables of the process were examined in a modified laboratory-scale activated sludge unit. The concentration of ambient dissolved oxygen was continuously monitored for changes due to the influent composition of the wastewater. While the system was kept in a steady state, system variables were measured for MLVSS (mixed liquor volatile suspended solids), soluble TOC (total organic carbon) and rate of oxygen uptake. By increasing or decreasing the baseline feeding of TOC level, organic shock loading was induced. When a transient loading took place, DO monitoring was accomplished with a DO analyzer. A material balance equation for DO in the system was formulated, and the dynamics of the oxygen uptake rate were investigated. Under transient conditions, the fluctuations in DO levels reflected changes in the exogenous respiration rate of the biomass in the system due to variations in the influent waste. Due to the rapid response to shock loading and the correlation between DO changes and the magnitude of shock loading, it was suggested that DO and oxygen uptake rate could be used as control variables for the activated sludge process. TECHNICAL, ECONOMIC AND ENVIRONMENTAL ASPECTS OF WET AND DRY DEBARKING.
Water and Pollution Control, Vol 118, No 9, p 34, 36, September, 1980. 1 Ref.

Descriptors: *Wood wastes, *Waste water treatment, *Bark, Pulp wastes, Saw mills, Water pollution control, Industrial wastes, Costs, Suspended solids.

A summary of a report on waste water technology, including debarking processes, is presented. Wet and dry debarking operations are compared in terms of energy requirements, economics, product quality, and effect on manufacturing processes. A review is also presented of waste-water treatment alternatives representing technically feasible and economically viable systems which would permit the discharge or recycling of debarker waste water of acceptable quality. Systems using hydraulic jets, mechanical rings, wet drums, and dry drums in debarking arrangements were investigated. Varia-

bles that influence the efficiency of wet and dry debarking include the wood species, harvesting and debarking seasons, log quality, and storage methods. The projected cost of effluent control has been the major reason for both saw mills and pulp mills shifting from wet to dry debarking techniques. Savings roughly balance the additional costs. Current effluent treatment for wet debarkers is focused upon suspended solids removed. Improved techniques will be necessary for many wet debarkers to conform to present and projected future effluent regulations. (Baker-FRC)

The authors tested the validity of mathematical models using three substrates (glucose, phenol, and sulfanilic acid) of widely differing removal rates in the activated sludge process. Sludge from a municipal sewage treatment plant was acclimated as a seed in a continuous flow, completely mixed laboratory reactor. A mixture of the three substrates in varying combinations was fed at different food/microorganism (F/M) ratios. Total organic carbon (TOC) was the parameter chosen to measure overall removal rates. Specific analytical measurements for each substrate in the influent and effluent samples were also made. Models relating the effluent quality in terms of soluble TOC to F/M or to sludge age were presented. The authors concluded from their studies that the overall substrate removal rate in terms of TOC was the sum of the individual substrate removal rates. The substrate removal rates were shown to decrease with increasing sludge age and decreasing F/M. The calculated and experimentally determined biodegradable fraction of the mixed liquor volatile suspended solids was shown to increase with increasing organic loading. (McKenon-FRC)

CONTAMINATION OF GROUND WATER SUPPLIES BY TRICHLOROETHYLENE--THREE CASE HISTORIES,
Weston (Roy F.), Inc., West Chester, PA.
W. J. Duffy, R. Moose, and S. J. Tomalavage.
In: Third Annual Madison Conference of Applied Research & Practice on Municipal & Industrial Waste, September 10-12, 1980, p 187-200. 3 Fig, 2 Tab. University of Wisconsin-Extension, Department of Engineering & Applied Sciences, 432 N. Lake Street, Madison, WI 53706.

Descriptors: *Water pollution control, *Organic compounds, *Groundwater resources, *Chlorides, Pennsylvania, Water pollution, Adsorption, Solvents, Industrial wastes, Trichloroethylene.

Clean groundwater is a resource that is rapidly becoming depleted in suburbanized areas throughout the United States, in part because of extensive contamination by organic solvents such as trichloroethylene (TCE) and methyl chloride (MC). Two important properties relating to groundwater contamination are specific gravity and solubility. Both TCE and MC are heavier than water and only slightly soluble; therfore, when spilled neither degrades but begins moving downward within the aquifer. Chlorinated hydrocarbons will remain stable in a subsurface environment essentially forever. Three programs in Pennsylvania to renovate groundwater resources show that while air-stripping is often a viable procedure, it cannot be used in all situations. Numerous other techniques to remove volatile hydrocarbons are available, such as adsorption of organic compounds by synthetic resins or activated carbon. However, maintenance costs and costs of disposal of used materials are problems associated with these technologies. Studies of these aquifers should be considered so that if subsequent contamination occurs, baseline data will be available to define and determine the contaminants. Monitored use of solvents within the industry, as well as increased public awareness of the problems created by use of these compounds, may prevent continued degradation of groundwater resources. TREATMENT OF MILILANI STP EFFLUENT FOR DRIP IRRIGATION OF SUGARCANE,
Hawaii Univ., Honolulu.
E. K. F. Liu, and R. H. F. Young.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-144651, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Center, University of Hawaii, Honolulu, Technical Report No 128, July, 1979. 32 p, 13 Fig, 9 Tab, 19 Ref. 14-34-0001-9013.

Descriptors: *Waste treatment, *Water reuse, *Drip irrigation, *Sewage effluents, Return flow, Physicochemical properties, Sugarcane, Ditches, Irrigation systems.

The secondary effluent of the Mililani STP is intended for use in the drip irrigation of sugarcane. The relative success of this waste water reuse application is affected by the concentration of suspended solids in the sewage effluent. Chemical coagulation, dissolved air flotation, and granular media filtration were studied in the laboratory to determine the most cost-effective means of obtaining a sewage effluent with a suspended solids content similar to that of the water from Waiahole Ditch presently used in drip irrigation. Of the three methods tested, granular media filtration with anthracite coal-silica sand media at a flow rate of .001 7 cu m/s/sq m (2.5 gpm/sq ft) was a cost-effective method of producing a sewage effluent with suspended solids concentration in the range of that found in Waiahole Ditch water during dry weather. Model laboratory testing shows that application of this sewage effluent will not adversely affect the type of filter media used in drip irrigation. Preliminary analysis of the residual solids distribution found in the sewage effluent after this posttreatment shows that failure of the drip irrigation system due to excessive plugging should not be a problem. The estimated annual cost of this treatment system is $147,000 based on a 0.16 cu m/s (3.6-mgd) flow, or $40,830/mgd. (Author's abstract)

IRON REMOVAL BY ROTATING CONTACT REACTOR,
Missouri Univ.-Columbia. Dept. of Sanitary Engineering.
L. W. Tharpe.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-144644, Price codes: A03 in paper copy, A01 in microfiche. Master of Science Thesis, May, 1979. 31 p, 8 Fig, 2 Tab, 16 Ref. OWRT-B-124-MO (3).

Descriptors: *Iron, *Water purification, *Water treatment, Equipment, Instrumentation, *Waste water treatment, Research and development, Ferrobacillus, Iron bacteria, Microorganisms, Water quality, Treatment, Quality control, Separation techniques, Impaired water quality, Waste water(Pollution), Evaluation, Testing, Rotors, Research equipment, Flow rates, Flow, Oxidation.

Feasibility assessment was made of using a rotating contact reactor to remove iron (Fe(II)) from water. Total soluble iron was determined using the Hach-Ferrozine method. The study was conducted in two phases: (1) determination of Fe(II) removal kinetics for the reactor at various flow rates, and (2) evaluation of the effect of disc surface area on overall Fe(II) removal. Hydraulic detention times less than fifty minutes reduced the percent removal of Fe(II) (from about 99%), according to a first-order (linear) relationship between Fe(II) removal and contactor stage detention time (slope: 2.13/minute). The rotating contactor could achieve 96-99% removal of total iron from a ferrous iron feed stream having a concentration up to 28 milligrams per liter. With eleven or six rotating discs, 99% Fe(II) removal was obtained; but this declined to 81% with all discs removed. Since stabilization of the rotating contactor after changing the flow rate was achieved in such short times (one day or less) relative to times required for biological systems (5-6 days), the oxidation and removal of Fe(II) was probably due to physiochemical activity. Rotation of the discs promotes aeration and mixing, and increases the efficiency of Fe(II) removal. (Zielinski-IPA)

PROCESSES CONTROLLING VIRUS INACTIVATION IN COASTAL WATERS,
Harvard Univ., Cambridge, MA. Lab. of Microbial Ecology.
R. B. Kapuscinski, and R. Mitchell
Water Research, Vol 14, No 4, p 363-371, April, 1980. 2 Tab, 133 Ref.

Descriptors: *Water quality, *Viruses, *Marine bacteria, *Coasts, *Sewage effluents, Bacteriophage, Heavy metals, Suspended solids, Sludge disposal, Ultimate disposal, Coagulation, Solid wastes.

The biological, chemical, and physical processes that control virus inactivation in coastal waters are reviewed. An understanding of these processes is necessary for effective control of contamination in coastal waters used for human waste disposal. Evidence for a biological mechanism of dieoff comes from the isolation and identification of specific marine bacteria capable of inactivating viruses. However, their activity in the field is unknown Heavy metals have been implicated as being possibly virucidal in seawater, but the concentrations and complexes are not known. A thermal mechanism does not appear to be of primary significance, although temperature-correlated, seasonal variations in die-off rates have been reported. Laboratory experiments on virus adsorption predict that as much as 99% of the viruses present in coastal marine waters are adsorbed to naturally occurring colloidal and particulate matter. Other evidence indicates that viruses apparently survive longer in seawater in the adsorbed state. Laboratory studies of viral inactivation rates range from 1 to 43 days when expressed as the time required for 90% dieoff. These slow dieoff rates emphasize the need for more effective virus removal form sludge effluent. Increased control and efficiency of coagulation and sedimentation units for particulate and gross solids removal would appear to be one important step in controlling viral contamination of coastal waters. CONSTRUCTION ASPECTS OF OUTFALL DESIGN FOR GREATER ATHENS,
Hawksley (Watson), High Wycombe (England).
K. D. Staples, and J. J. Guilfoyle.
Progress in Water Technology, Vol 12, No 1, p 245-261, 1980. 5 Fig, 5 Ref.

Descriptors: *Outfall sewers, *Project planning, *Feasibility studies, *Waste water disposal, Europe, Coasts, Construction, Construction costs, Engineers estimates, Municipal wastes, Sewerage, Athens, Mediterranean Sea.

The feasibility and cost of construction of marine outfalls for the disposal of liquid wastes from Athens were determined. A comprehensive data base is considered necessary and should include information about marine conditions, geological

and geotechnical conditions, local contracting capabilities, and engineering ability to assess all of the available data. Because of the low velocity of currents in the Mediterranean, a high degree of treatment is necessary before discharge. The hydraulic characteristics of the outfall and the diffuser design are presented. Possible outfall routes are proposed, and specific construction methods are discussed. Estimated costs are included for various proposals. (Small-FRC)

SEWAGE TREATMENT AND EFFLUENT DISPOSAL OPTIONS APPROPRIATE TO MEDITERRANEAN COASTAL DEVELOPMENTS AS STUDIED FOR GREATER ATHENS,
Hawksley (Watson), High Wycombe (England).
S. D. Myers, and C. M. Ainger.
Progress in Water Technology, Vol 12, No 1, p 225-244, 1980. 4 Fig, 6 Tab.

Descriptors: *Waste water disposal, *Project planning, *Outfall sewers, Coasts, Contract administration, Bids, Waste water treatment, Europe, Sewage disposal, Liquid wastes, Municipal wastes, Athens, Mediterranean Sea.

The characteristics and requirements of liquid waste disposal for the Athens area were determined. The most suitable and most economic method was that of a settled effluent discharged through along outfall. Other situations along the Mediterranean call for different solutions. Small developments far from the coast require high quality effluents for discharge on to land or to torrents. Developments which need additional facilities to meet the demands of tourists can adapt land-based treatment for these seasonal loads rather than invest in a long outfall system. Alternative treatment and disposal options should be considered carefully. If sedimentation/long outfall or chemically assisted sedimentation/short outfall systems are to be installed, they must be specified in the tender documents calling for turnkey bids. (Small-FRC)

LEACHATE COLLECTION USING THE GROUND-WATER FLOW SYSTEM: A LANDFILL CASE HISTORY IN CENTRAL PENNSYLVANIA,
Meiser & Earl/Hydrologists, State College, Pennsylvania.
E. W. Meiser, Jr., T. A. Earl, and R. M. Bodner.
In: Third Annual Madison Conference of Applied Research & Practice on Municipal & Industrial Waste, September 10-12, 1980, p 214-227. 7 Fig. University of Wisconsin-Extension, Department of Engineering & Applied Sciences, 432 N. Lake Street, Madison, WI 53706.

Descriptors: *Landfills, *Leachate, *Linings, *Waste storage, *Waste disposal, Pennsylvania, Waste treatment, Waste dumps, Clays, Lagoons, Disposal, Groundwater resources, Construction costs.

Waste disposal sites which rely on natural renovation of leachate in thick, suitably textured soils are becoming rare as regulations describing site requirements become more stringent. Fulkroad's Landfill in Pennsylvania is an example of a natural renovation landfill that meets Pennsylvania leachate treatment requirements. It is located on dissected rolling upland approximately 600 feet above sea level. The fundamental concept underlying the design is that groundwater flow in a shallow groundwater setting is upwards, converging on a definable discharge zone where leachate can be intercepted. The landfill area is restricted to a single groundwater basin. All the base flow is then collected into a groundwater interceptor drain system, and the cost of a liner is eliminated. The leachate treatment utilizes an aerated lagoon, a settling lagoon, a stream discharge in wet weather and spray irrigation discharge during dry months, with provisions for a future lime-addition system. Given the tight hydrogeologic setting, the authors conclude that this technique can perform reliably and safely. It is hoped that EPA's Resource Conservation and Recovery Act guidelines will be revised to permit a reevaluation of acceptable liners beyond the current requirement of several feet of low permeability clay---often a prohibitively expensive installation. DISPOSAL OF LAKE SEDIMENTS CONTAINING ARSENIC,
Strand Associates, Inc., Madison, WI.
M. D. Doran, and M. A. Anderson.
In: Third Annual Madison Conference of Applied Research & Practice on Municipal & Industrial Waste, September 10-12, 1980, p 429-440. 5 Fig, 2 Tab. University of Wisconsin-Extension, Department of Engineering & Applied Sciences, 432 N. Lake Street, Madison, WI 53706.

Descriptors: *Lake sediments, *Sedimentation, *Dredging, *Water pollution, *Arsenic compounds, Wisconsin, Groundwater resources, Disposal, Waste disposal, Wells, Potable water, Clays, Waste storage.

During the 1950's and 1960's, a total of 27,000 pounds of arsenic as sodium arsenite was applied to Little Muskego Lake in Wisconsin to control aquatic macrophytes that interfered with recreational usage. The proposed project would remove about 2.25 million cubic yards of sediment---7,000 pounds of the applied arsenic---by hydraulic dredging, and deposit it in a disposal site near a large number of private water supply wells. The study suggests that arsenic contamination of groundwater is unlikely and even under worst case anaerobic conditions, soluble arsenic concentrations would still be expected to meet drinking water standards. Sediment arsenic is strongly adsorbed by sediment solids and by native soils from the disposal sites. The dissolved arsenic concentrations would not exceed 50 micrograms/L within the sites, and would decrease in concentration to 5 micrograms/L after passing through only a few centimeters of native soil. To provide an additional safety factor, a minimum of eighteen inches of clayey bottom soil, along with groundwater quality monitoring, is proposed at the disposal sites. (Garrison-Omniplan)

EVALUATION OF PROCEDURES FOR RECOVERY OF VIRUSES FROM WATER. I. CONCENTRATION SYSTEMS,
Severn Trent Water Authority, Coventry (England). Regional Lab.
R. Morris, and W. M. Waite.
Water Research, Vol 14, No 7, p 791-793, July, 1980. 3 Tab, 11 Ref.

Descriptors: *Viruses, *Filters, *Adsorption, Potable water, Rivers, Biological membranes, Separation techniques, Water purification, Analytical techniques, Aluminum, Cation adsorption, Cations, Monitoring, Aquatic ecosystems.

Two fiberglass filters and one cellulosic filter were evaluated for the recovery of poliovirus type 2 seeded into tap and river waters. The organic flocculation technique was used as a standard secondary concentration procedure with the aim of establishing a reliable method for the routine virological monitoring of aquatic ecosystems. The role of aluminum cations in viral recovery was also investigated. The best recoveries were obtained with fiberglass filters used in conjunction with 0.005 M AlCl3 x 6H20. A four-fold greater efficiency was achieved in fiberglass filters with added aluminum cations than without the aluminum cations. No such effect from the addition of aluminum cations was observed in the viral recovery efficiency of the cellulose nitrate membrane filters. The efficiency of organic flocculation as a secondary concentration step varied with viral serotypes used. The methods investigated were considered suitable for recovery of enteroviruses from tap and river water. (See also W81-00767) (Geiger-FRC)

MODE OF BACTERIAL INACTIVATION BY CHLORINE DIOXIDE,
John Hopkins Univ., Baltimore, MD. Div. of Environmental Health Engineering.
S. D. Roller, V. P. Olivieri, and K. Kawata.
Water Research, Vol 14, No 6, p 635-641, June, 1980. 6 Fig, 17 Ref.

Descriptors: *Bacteria, *Disinfection, *Chlorine dioxide, *Mode of action, E. coli, Chlorination, Viability, Proteins, Pollutants, Water treatment, Potable water, Chlorine, Enzymes.

The effects of chlorine dioxide, an alternative for chlorine as a water disinfectant, on the dehydrogenase enzymes, protein synthesis, and deoxyribonucleic acid (DNA) of bacteria were examined. Tests were conducted in a unit which allowed sampling for bacterial survivals from 5 to 1800 seconds after chlorine dioxide addition. The pour plate method was used to assess bacterial numbers, and total dehydrogenase activity of E. coli was measured colorimetrically. Cell extracts were evaluated for their ability to incorporate radioactive phenylalanine into protein, and DNA from Haemophilus influenzae treated with chlorine dioxide was tested for its ability to transform competent cells. The transformability of partially purified DNA exposed to chlorine dioxide was also determined. Results showed a complete inhibition of total dehydrogenase activity within the first 5 seconds of exposure. Protein synthesis was inhibited by chlorine dioxide in a dose-dependent manner. Treatment with glutathione did not reverse the effects of the disinfectant on total dehydrogenase activity, protein synthesis, or bacterial viability. Chlorine dioxide had no observable effect on the DNA transforming ability of whole cells or partially purified DNA extracts of H. influenzae. It was concluded that neither dehydrogenases, DNA, nor proteins are the major site of action of chlorine dioxide on bacterial cells, although inhibition of protein synthesis may play a part in cell mortality. KINETICS OF SORPTION AND DESORPTION OF HCL AND LOW MOLECULAR WEIGHT ORGANIC ACIDS BY STYRENE AND ACRYLIC WEAK BASE RESINS,
Chemical Technology Inst., Prague Czechoslovakia). Dept. of Power Engineering.
Z. Matejka, and J. Eliasek.
Water Research, Vol 14, No 5, p 467-470, May, 1980. 4 Tab, 5 Ref.

Descriptors: *Acids, *Sorption, *Ion exchange, Resins, Plastics, Kinetics, Inorganic acids, Organic acids, Separation techniques, Gels, Diffusion.

The diffusion rates of HCl and low-molecular weight organic acids such as caproic acid and sulfosalicyclic acid were compared on polystyrene and acrylic weak base resins for sorption and desorption. The kinetics for comparison of the individual resins were calculated on the basis of a reaction half-time. The effects of macroporous or gelular matrix on the kinetic properties for styrene and acrylic resins were determined and compared. Acrylic resins were preferable for sorption and desorption of HCl at low concentrations. The macroporous-styrene resins were better at higher concentrations. At all concentrations the sorption of low-molecular organic acids was primarily controlled by selectivity and proceeded faster on acrylic resins. The concentration of the elution solution governed desorption. Desorption occurred faster on macroporous styrene resins. The macroporous matrix in general had a substantially smaller kinetic advantage for acrylic than for styrene weak base resins. (Baker-FRC)

THE PRODUCTION OF BROMOPHENOLS RESULTING FROM THE CHLORINATION OF WATERS CONTAINING BROMIDE ION AND PHENOL,
Michigan Univ., Ann Arbor. Dept. of Environmental and Industrial Health.
J. A. Sweetman, and M. S. Simmons.
Water Research, Vol 14, No 3, p 287-290, March,

1980. 1 Fig, 3 Tab, 26 Ref.

Descriptors: *Chlorination, *Phenols, *Water treatment, *Bromide, Water pollution sources, Chemistry, Halogens, Aromatic compounds, Ammonia, Laboratory tests.

Chlorine-induced bromination using phenol as a model compound was investigated as part of a study of possible formation of brominated phenols during the chlorination of natural waters. The water sample to be chlorinated contained both phenol and bromide ion at a pH of 7.4. Direct bromination with HOBr was tested at four ratios of HOBr:phenol. In all cases the main product was 2,6,6-tribromophenol. Chlorine-induced bromination with equimolar amounts of hypochlorous acid and KBr added produced 2,4,6-tribromophenol. The findings suggest that chlorination, bromination and mixed halogenation products should be expected when water that contains bromide ion undergoes chlorination. The presence of ammonia in the water can affect the outcome. (Baker-FRC)

COLOUR AND TURBIDITY REMOVAL WITH REUSABLE MAGNETIC PARTICLES-I. USE OF MAGNETIC CATION EXCHANGE RESINS TO INTRODUCE ALUMINIUM IONS,
Commonwealth Scientific and Industrial Research Organization, South Melbourne (Australia). Div. of Chemical Engineering.
N. J. Anderson, R. J. Eldridge, L. O. Kolarik, E. A. Swinton, and D. E. Weiss.
Water Research, Vol 14, No 8, p 959-966, August, 1980. 2 Fig, 4 Tab, 10 Ref.

Descriptors: *Flocculation, *Turbidity, *Surface waters, *Aluminum, *Cation exchange, Suspended solids, Separation techniques, Sludge, Hardness, Color, Iron oxides, Water purification, Water treatment, Adsorption, Magnetism.

The recovery of suspended solids from surface waters by magnetic action exchange resins was studied in laboratory test. An amberlite CG50 resin and a magnetic PVA acrylic acid graft resin were examined for Al and Fe cation adsorption. Results showed that 70-80% loadings of Al and 15-30% loadings of Fe could be achieved under the range of pH values tested. Other experiments using resins of various particle sizes were conducted, with and without the incorporation of magnetic iron oxide into the resins. When the resin beads were small they acted as nuclei for floc settling, and flocculation was accelerated. When magnetic iron oxide was incorporated into the resin beads, they were easily separable from the clarified water. Partial reloading of the resin with Al cations was carried out by acidification of the resin-containing sludge. Hydrolysis of Al ions within the resin made the regenerated sludge ineffective as a coagulant. (Geiger-FRC)

AN EPIDEMIOLOGIC STUDY OF THE RELATIONSHIP BETWEEN HEPATITIS A AND WATER SUPPLY CHARACTERISTICS AND TREATMENT,
Health Research Lab., Cincinnati, OH.
O. Batik, G. F. Craun, R. W. Tuthill, and D. F. Kraemer.
American Journal of Public Health, Vol 70, No 2, p 167-168, February, 1980. 9 Ref.

Descriptors: *Viruses, *Disinfection, *Human diseases, *Epidemiology, *Potable water, Chlorination, Water treatment, Public health, Water pollution, Morbidity, Water pollution sources, Water supply, Statistics.

Outbreaks of hepatitis A (HA) have been associated with drinking water contamination. An ecological cross-sectional study was conducted to determine whether water source or water treatment processes impact upon endemic rates of HA. Only counties of the state studied which had distinct water treatment and distribution systems were included in the investigation. State Health Department records of HA morbidity data from 1965 to 1977 were utilized, and demographic variables were examined to control for factors which might influence HA morbidity rates. Results showed that none of the water supply source or treatment variables was significantly correlated with HA age-adjusted morbidity ratios. A statistically significant relationship was noted between mean annual HA rates and the median age of the county population. It was suggested that the hypothesized relationship between water treatment processes and HA might not have been detectable on the county data level and therefore, weak relationships between the two on an individual basis should not be ruled out. PRECHLORINATION TREATMENT OF WATER TO REDUCE CHLOROFORM LEVELS,
Kansas Univ., Lawrence. Dept. of Chemistry.
K. Voss, T. Votapka, and C. Bricker.
Water Research, Vol 14, No 7, p 921-926, July, 1980. 5 Fig, 1 Tab, 15 Ref.

Descriptors: *Water treatment, *Trihalomethanes, *Chloroform, *Water quality, *Humic acids, Public health, Potable water, Decomposing organic matter, Chlorination, Gas chromatography.

In an effort to remove the precursors of trihalomethanes (THM), solutions of humic acid as well as Kansas River water were treated with potassium permanganate ($KMnO_4$), potassium ferrate (K_2FeO_4) or hydrogen peroxide (H_2O_2) prior to chlorination. Ferrate pretreatment had no effect in reducing the amount of chloroform produced when water containing humic acid was chlorinated. Pretreatment of humic acid solutions with $KMnO_4$ at an initial pH of 10.3 prior to chlorination significantly reduced the formation of chloroform. A 5 ppm solution of humic acid treated with H_2O_2 at a pH of 10.3 for 68 hr and then with hypochlorite for 16 hr had no detectable chloroform present. Kansas River water treated with H_2O_2 and hypochlorite also had chloroform levels below detectable limits. All solution preparation and analytical conditions and methodologies are described in detail. (McKeon-FRC)

CALCIUM CARBONATE HEXAHYDRATE: ITS PROPERTIES AND FORMATION IN LIME-SODA SOFTENING,
Essex Water Co., Maldon (England).
J. G. Slack.
Water Research, Vol 14, No 7, p 799-804, July, 1980. 3 Fig, 4 Tab, 6 Ref.

Descriptors: *Water softening, *Lime, *Calcium carbonate, *Hydrates, Hardness, Water treatment, Precipitation, Calcium compounds, Chemical properties, Separation techniques, Rivers, Crystallization, Hydration, Calcite, Sodium compounds

The occurrence of supersaturation during lime/soda water softening is usually associated with the formation of a metastable hexahydrate of calcium carbonate that crystallizes when conditions are unfavorable for production of the usual calcite product. This hexahydrate has been reported to occur at several water treatment works for Essex River waters. Formation of the hydrated salt was favored by high orthophosphate levels and low water temperatures. The pure well-defined crystals formed by calcium carbonate hexahydrate were much more soluble in water than calcite crystals. When the hydrated product crystallized, the efficiency of the lime/soda water softening process was considerably reduced, requiring increased chemicals for softening and subsequent stabilization of softened water. Hexahydrate formation has been considerably reduced by phosphate precipitation by ferric salts before softening and by seeding with pre-fabricated calcite nuclei to induce calcite crystal formation. LAKE RESTORATION BY DILUTION: MOSES LAKE, WASHINGTON,
Washington Univ., Seattle. Dept. of Civil Engineering.
E. B. Welch, and C. R. Patmont.
Water Research, Vol 14, No 9, p 1317-1325, September, 1980. 5 Fig, 4 Tab, 11 Ref.

Descriptors: *Lakes, *Algae, *Eutrophication, Cyanophyta, Nuisance algae, *Water quality control, Nutrients, Nutrient removal, Water quality, Chlorophyll, Phosphorus, Reclamation, Water pollution control, Washington.

Low nutrient water from the Columbia River was added to Moses Lake at Parker Horn on three occasions in 1977 and once in 1978, during the spring-summer period. Chlorophyll a decreased to a May-September mean of about 15 microg/liter in 1978, which was a reduction of almost 80% in Parker Horn compared with 1969-70 values, and over 60% elsewhere in the lake. Total phosphorus (P) declined as much as 50-60% below the 1969-1970 values, but still remained rather high (70-90 microg/liter). Following dilution, blue-green algae comprised much less of the plankton crop (96% in 1970 compared with 68% in 1977-78). On an annual basis the dilution water did not show such a marked impact on P inflow concentration, reducing it from about 130-140 microg/liter to 100 microg/liter. Thus, the striking improvement in blue-green algal levels was apparently caused by factors other than a limitation on the pool of total P, and may be related to dilution of blue-green excretory products. A dilution water input of about 6 cu m/s continuously during April-September should provide adequate control of eutrophication in at least 30% of the lake volume proximal to the input and Parker Horn. That would provide an exchange rate of 5%/day for Parker Horn and should achieve lake water residuals of $<$ or $=$ 50% by midsummer. Two additional inputs to the lake are proposed for Phases II and III of the restoration project. (McKeon-FRC)

The effectiveness of a chlorine residual in water distribution systems in protecting against bacterial and viral contamination was investigated in a simulated situation of cross connection contamination by autoclaved raw sewage spiked with 2 viruses and 3 bacteria. Tap water was adjusted to the proper pH, temperature and residual chlorine level, then challenged with varying levels of the autoclaved sewage seeded with Salmonella typhimurium, Shigella sonnei, a coliform (IMVIC $++--$), poliovirus 1 and bacterial virus f2. Survival of the sewage contaminants was determined over a 2 hour period. Microbial inactivation increased with decreasing pH and sewage levels and increasing temperatures and chlorine levels. A greater inactivation of microbes occurred with an initial free chlorine residual than was found with an equivalent initial combined chlorine residual. The most resistant species was bacterial virus f2, followed by poliovirus 1 and the three bacterial organisms. A bacterial inactivation of 3 logs or greater and a

viral inactivation of less than 2 logs was achieved after 1 hour with addded sewage levels up to 1% by volume at pH 8 and an initial free chlorine residual of 0.7 mg/liter. (Geiger-FRC)

5G. Water Quality Control

INTERACTION OF BACTERIOPHAGE R17 AND REOVIRUS TYPE III WITH THE CLAY MINERAL ALLOPHANE,
Waikato Univ., Hamilton (New Zealand). Dept. of Chemistry.
D. H. Taylor, A. R. Bellamy, and A. T. Wilson.
Water Research, Vol 14, No 4, p 339-346, April, 1980. 6 Fig, 1 Tab, 30 Ref.

Descriptors: *Adsorption, *Clay minerals, *Viruses, *Water purification, Montmorillonite, Infection, Hydrogen ion concentration, Kinetics, Bacteriophage, Suspended solids, Kaolinite, Illite, Suspensions, Natural streams, Phosphates, Sodium chloride, Salts, Freshwater, Radioactivity, Physical properties.

Clay minerals have been shown to be effective adsorbents of viruses due to the high surface area provided by their fine particle size. The use of clay minerals as a means of reducing virus particles in water purification seems attractive due to the readily available supply of these substances at low costs. The effectiveness of the amorphous aluminosilicate clay mineral allophane as an adsorbent for R17 bacteriophage and reovirus type III was examined. The principal factors affecting adsorption were found to be mixing time, pH, and the concentrations and isoelectric points of both the allophane and the viruses. Allophane exhibited good adsorption of both reovirus type III and the R17 bacteriophage in the pH range of 5 to 7, corresponding to the pH range of many natural freshwater systems. Experiments using highly purified radioactively labeled reovirus were conducted to investigate the kinetics of virus adsorption to allophane. Virus desorption was studied in solutions of sodium chloride, sodium phosphate, and sodium hexametaphosphate. These studies made it possible to follow the distribution of the virus in a clay suspension and observe its specific infectivity. When adsorbed virus was eluted by neutral phosphate solutions it retained its physical integrity but had a lower specific infectivity. (Geiger-FRC)

CATCHMENT QUALITY CONTROL,
Thames Water Authority, London (England). Directorate of Scientific Services.
L. B. Wood, and M. L. Richardson.
Progress in Water Technology, Vol 12, No 3, p 1-12, 1980. 2 Fig, 10 Tab, 9 Ref.

Descriptors: *Quality control, *Potable water, *Methodology, *Chemicals, *Rivers, Water quality, Reclaimed water, Industrial wastes, Surfactants, Runoff, Water pollution sources, Detergents, Europe, Thames River, Lee River, London, United Kingdom.

A procedure was established for assessing the nature and concentrations of micropollutants from all sources in river water used for potable supply. This report deals with micropollutants from the following sources; industrial discharges, agricultural and highway run-off, and domestic wastes. Domestic wastes include pharmaceutical products, detergents, cosmetics, toiletries, and disinfectants. Studies were made of the quality of the water in the Lee River and Thames River near London. Results are given for: micropollutants in the Lee River derived from industrial sources, micropollutants in the non-tidal Thames and Lee Rivers, and concentration of non-ionic surfactants in the Thames and Lee Rivers. Despite the wide range of sources of chemicals that could enter the water cycle, no particular hazard was found. (Small-FRC)

WELL WATER QUALITY ON MOEN ISLAND, TRUK,
Guam Univ., Agana. Water Resources Research Center.
R. N. Clayshulte, and W. J. Zolan.
Technical Report No 13, September, 1980. 36 p, 12 Fig, 11 Tab, 12 Ref, 1 Append.

Descriptors: *Guam, *Wells, *Groundwater, *Water pollution sources, Chemical analysis, *Water quality, Chlorination, Anaerobic bacteria, Nitrogen compounds, Disinfection, Potable water, Water temperature, Subsurface investigations, Physical properties.

A study was begun in May 1979 to determine the water quality of production wells connected to the distribution system of Moen Island. Six wells were monitored on a monthly basis for one year. Basic physical, chemical and bacteriological parameters were measured from water samples collected at each well head after a minimum one minute flushing period. Average well water pH ranged from 6.21 to 6.54. Levels of free carbon dioxide were generally high; however, dissolved nitrogen and phosphorus concentrations were low. Dissolved nutrients do not effect the structural components of the wells. Mean temperatures were consistent between the wells and were not considered abnormally high. Alakalinity values were always in the form of bicarbonate alkalinity, and showed decreases from January to May 1980. Chlorine levels were low except for one well. The mean turbidity levels of 4 wells were in violation of the territorial safe drinking water standard. Sulfate and reactive silicate concentrations were low in all of the well waters. Contamination is the major problem associated with production wells, including frequent total coliform bacteria and high turbidity levels. These imply groundwater contamination. Recommendations to improve well water quality include: disinfection procedures, monitoring programs, and methods to determine sources of contamination. (Vernale-Omniplan)

Water Research, Vol 14, No 10, p 1489-1499, October, 1980. 12 Fig, 2 Tab, 49 Ref.

Descriptors: *Copper sulfate, *Aquatic life, *Monitoring, *Environmental effects, *Algicides, *Sampling, Aquatic bacteria, Nutrients, Phosphorus, Aquatic algae, Lakes, Pesticides, Zooplankton, Aquatic populations, Cazenovia Lake(NY).

A time intensive monitoring program was used to evaluate the toxicity of three low level copper sulfate applications (455 kg CuSO4x5H2O in a 10% solution) to Cazenovia Lake, New York. Filtered and total copper, type and number of phytoplankton, in situ assimilation of radioactively labeled carbon, bacterial numbers, enumeration and identification of zooplankton, the status of macrophyte nutrients, and filtered and reactive total phosphorus were assessed. Copper sulfate treatment caused only a slight increase in filtered copper levels, with maxima of 5 micrograms/liter over a 2-5 day period. No algicidal action resulted from the low level applications; however, short term stress and changes in the natural seasonal succession within these populations were observed. No significant effects upon the zooplankton, submerged macrophytes, or amounts of phosphorus in the water column were found due to the low level treatments. After each copper sulfate application, sharp decreases were noted in the water column bacteria, showing the direct negative impact of the treatment. After several days, recoveries in bacterial populations were observed. Phytoplankton populations reached normal levels within 1 week after copper sulfate treatment. (Geiger-FRC)

GREEN RIVER BASIN OPTIMIZATION - SIMULATION MODEL,
Purdue Univ., Lafayette, IN. Water Resources Research Center.
H. Yazicigil, G. H. Toebes, and M. H. Houck.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-143356, Price codes: A10 in paper copy, A01 in microfiche. Technical Report No 137, November, 1980. 190 p, 74 Fig, 32 Tab, 26 Ref, 2 Append. OWRT B-094-IND(5).

Descriptors: *Model studies, *Optimization, *Reservoir operations, *Flood control, *Recreation, *Low flow augmentation, River forecasting, Reservoir management, Reservoir releases, Reservoir storage, Synthetic hydrology, Flow augmentation, Reservoir yield, Kentucky, *Green River basin(KY).

The report presents an optimal operation of an existing multi-purpose multireservoir system using forecasts. An optimization - simulation model is constructed for a system of four flood control reservoirs in the Green River Basin, Kentucky, having recreation and low-flow augmentation as secondary objectives. The resulting model, called GRB0PM2, is designed for use in real-time as well as in long-run operation studies. The descriptive

components of the model consists of a segmented model comprising nine multi-input linear (MIL) models of the river system downstream of the four reservoirs; whereas the prescriptive component is largely in the form of an operating policy algorithm that involves repeated solution of a mathematical problem. The optimization technique employed to solve the mathematical program is Linear Programming. The use of the GRBOPM2 model in long-run reservoirs operations studies is demonstrated. The systems responses under various operating and hydrologic conditions have been obtained. In particular trade-off curves between various systems' objectives were generated both for winter and summer sessions by using historical hydrologic as well as synthetic model input data.

PUMPED STORAGE SITE SELECTION PROCESS AS DEVELOPED BY THE SALT RIVER PROJECT, PHOENIX, ARIZONA,
Salt River Project, Phoenix, AZ.
G. D. Harris.
In: Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations, May 15-16, 1979, Clemson, South Carolina, Clugston, J.P., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/28, April, 1980, p 190-206. 7 Fig, 68 Ref.

Descriptors: *Pumped storage, *Reservoir sites, *Hydroelectric plants, *Decision making, Reservoirs, Planning, Arizona, Evaluation, Cost analysis, Topography, *Phoenix(AZ).

Current projections of the demand for electrical power in Arizona indicate that the portion of the Phoenix Metropolitan area served by the Salt River Project will have sufficient generation capacity to provide for the base load for the foreseeable future, but that peak period demand will exceed the generation capacity in the early 1990s. A study was undertaken to select the best site in Arizona for a new hydroelectric pumped storage facility. A total of 138 sites were identified, based on topography. A series of three screening processes was applied to the sites. Screening was guided by two primary premises: all screens were to be positively pass or fail, and the screens were to be in a sequence that allowed dropping a number of sites based on existing information before screens requiring additonal research were applied. The screening procedure left a total of 16 sites. Further evaluation left six sites for which cost estimates were developed. One site, Alchesay Canyon, was selected for further study, with four backup sites. (Moore-SRC)

URBAN WATER SUPPLY PLANNING,
Southern Illinois Univ., Carbondale.
D. D. Baumann, and J. J. Boland.
Water Spectrum, Vol 12, No 4, p 33-41, Fall, 1980. 1 Fig, 1 Tab.

Descriptors: *Planning, *Water management, *Water resource development, *Water utilization, Urban hydrology, Efficiencies, Costs, Water resources, Water quality, Water supply, Water requirements.

Present urban water supply planning has become a challenging and complex task. Today's problems in planning reflect not only an inadequate supply, but a wide range of factors involving projection and management. Water conservation, i.e., a beneficial reduction in water use or water loss, is increasingly important. All water conservation practices are components of efficient management of water resources. The water resource planner must consider the efficient allocation of water resources at every stage of distribution and use. Many problems are associated with measuring the effectiveness of potential water conservation techniques. Urban water supply planning is influenced by environmental restrictions, laws and regulations, water quality criteria, increased energy costs, and water resource development expenses and water demands. Various approaches available to the water resource planner are discussed, and the effectiveness of each is evaluated. (Geiger-FRC)

COMMUNITY PLANNING FOR WATER RESOURCES MANAGEMENT, A GUIDEBOOK.
Skidmore, Owings, and Merrill, Boston, MA.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-144867, Price codes: A03 in paper copy, A01 in microfiche. Publication prepared for Office of Water Research and Technology, September, 1979. 24 p, 6 Fig. OWRT-C-80104-P(No 8402)(2).

Descriptors: *Water resources development, *Planning, *Community development, *Water utilization, *Water resources planning, Resources, City planning, Economics, Urbanization, Rural areas, Alternate planning, Evaluation, Cities, Legislation, Legal aspects, Institutions, Institutional constraints, Alternative water use, Comprehensive planning, Governments, Water resources, Administration, Management.

This guidebook provides a step-by-step method to help local officials and concerned citizens solve their water resources problems by developing a community water resources management plan. Five specific steps are outlined in the planning process (with participation in planning factored into each of these steps): (1) definition of problems and goals; (2) collection and study of available data; (3) generation of a set of alternatives; (4) evaluation of the possible effects of each alternative; and (5) selection of a course of action leading from point of decision to implementation. Selection of the official or agency for a given town or city that is best prepared or most appropriate to initiating action was recommended. Numerous examples are provided for the detailed five-step process. The procedures described are designed to assist individuals in the creation of a water resources management plan to suit their community. The steps may be modified or reiterated in order to effect optimum results. The guidebook is written in a personal guidance narrative form. (Zielinski-IPA)

6B. Evaluation Process

SCALING IMPACTS OF ALTERNATIVE PLANS,
Colorado Univ. at Boulder. Center for Research on Judgement and Policy.
C. A. Brown, R. J. Quinn, and K. R. Hammond.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-128886, Price codes: A06 in paper copy, A01 in microfiche. Water and Power Resources Service Report, June 1980. 109 p, 24 Fig, 6 Ref, 7 Append. 8-02407.

Descriptors: *Water resources development, *Alternative planning, Environmental effects, Social impact, Reliability, Measurement, Evaluation, Value, Planning, Validity.

The report describes procedures for improving measurement of the effects of alternative water development plans - particularly environmental and social impacts. Basic issues in measurement are related to the task of comparing alternative plans. Four types of measurement scales are evaluated in terms of their usefulness in the planning process. The concepts of reliability and validity are discussed in detail as is the concept of a measurement standard. Measurements required for water resources planning are divided into four types: Type I - Objective application of a measurement standard; Type II - Subjective application of a measurement standard; Type III - Subjective application of general scientific principles; Type IV - Subjective application of personal values. Procedures are presented for improving measurement types II, III, and IV, focusing on: (1) Disaggregating multidimensional factors (e.g., social well-being) (2) Defining factors and subfactors; (3) Specifying relations between factors and subfactors; (4) Integrating subfactor impacts; and (5) Defining higher order factors. A STUDY OF THE IMPACT OF THE HUGO RESERVOIR ON CHOCTAW AND PUSHMATAHA COUNTIES: A VIEW FOUR YEARS AFTER COMPLETION.
Evans (R. E.) and Associates, Norman, OK.
Army Engineer Institute for Water Resources Research Report 80-R1, April 1980. 241 p, 13 Fig, 53 Tab, 38 Ref, 5 Append.

Descriptors: *Economic impact, *Reservoirs, *Social impact, *Post-impoundment, *Oklahoma, Economic prediction, Reservoir construction, Employment, Recreation, Agriculture, Human population, Construction, Powerplants, Land use, Forecasting, *Hugo Reservoir(OK).

In 1967 the Corps of Engineers commissioned a pro-forma study of the impact of the Hugo Reservoir on two Southeastern Oklahoma counties, Choctaw and Pushmataha. More than ten years have passed since the first study and the construction of the reservoir were begun and more than four years have elapsed since water impoundment in the reservoir began. The actual effects of the reservoir on the study area is compared with the effects forecast by the earlier study, and new forecasts are based on the effects already experienced. The impacts measured in this study were for the short-term period, 1967-1977, and the forecasts extend to 2050 in most cases. The population of the area increased by nearly 3,000 persons between 1967 and 1977. The labor force, per capita income, farm output, value added by manufacture and bank deposits have all increased during the same period. Total construction activity in the area by 1977 exceeded the level of 1967 by $11 million, and a rapid increase in construction is projected for the period between 1980 and 2000 due to the construction of a new coal fired generating plant. The creation of the Hugo reservoir resulted in the emergence of the recreation industry as a major econmic activity in the area. The use of land changed little between 1967 and 1978, although residential uses near the lake increased by 24 acres. (Moore-SRC)

RIVER RECREATION USE AND ANALYSIS OF CARRYING CAPACITY,
Vermont Univ., Burlington.
R. E. Manning.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-145088, Price codes: A05 in paper copy, A01 in microfiche. Vermont Water Resources Research Center, University of Vermont, Technical Completion Report, October, 1980. 83 p, 13 Fig, 23 Tab, 68 Ref, 4 Append, OWRT-A-034-VT(1), 14-34-0001-9048.

Descriptors: *Recreation demand, *Vermont, *Rivers, *Social aspects, Water types, Recreation, Fishing, Boating, Swimming, Evaluation, Synoptic analysis, Recreation facilities, Social carrying capacity, River types, River management, User satisfaction.

The major objectives of this study were to describe the nature and intensity of river recreation activity in Vermont and to develop methods for determining the social carrying capacity of rivers for recreation. The principal research method was a field survey of recreationists on four major Vermont rivers during the spring and summer of 1978. Substantial dissatisfaction was found among river users

with regard to selected river use problems and conflicts. Several systematic relationships were found between recreation activity patterns and river type as defined by physical/biological characteristics and cultural setting. Each of six river types examined demonstrated distinctive patterns of recreation behavior with regard to type and intensity of recreation activities, desired use densities, and problems and conflicts experienced by recreationists. These relationships provide an important initial base upon which to structure comprehensive river recreation planning and management. This study recommends special efforts to protect and preserve the recreation values of Vermont's rivers and streams.

OPTIMAL REGIONAL CONJUNCTIVE WATER MANAGEMENT,
Auslam and Associates, Sacramento, CA.
J. E. Noel, B. D. Gardner, and C. V. Moore.
American Journal of Agricultural Economics, Vol 62, No 3, p 489-498, August, 1980. 1 Fig, 7 Tab, 26 Ref. OWRT-B-187-CAL(6).

Descriptors: *Model studies, *Water allocation(Applied), *Cost analysis, *Water costs, *Water management(Applied), Pumping, Water utilization, Taxes, Management, Mathematics, Estimating, Analytical techniques, Simulation, Research and development, Testing, Water rates, Water sources, Water supply, Agriculture, Cities, Groundwater management, Groundwater, Surface waters, Economics.

An optimal control model was briefly described for determining the optimal spatial and temporal allocation of groundwater and surface water among agricultural and urban uses. The control model was then applied to a representative California region (Yolo County) under several sets of energy costs. Two policies (pro-rata allocation and taxation) were evaluated empirically as alternatives for accounting for externalities due to the common pool problem. The advantages of the control model over other dynamic models were enumerated. Optimal rates of groundwater pumpage over the planning horizon were highly sensitive to increasing energy costs. Groundwater basins are shown to react differently to alternative economic and hydrological parameters. In a dynamic setting, a policy of pump taxes was shown empirically to be superior to pro-rata quotas and uncontrolled pumpage. The two broad policy implications drawn from the results were that the areal size of a water resource-planning unit must be carefully chosen, and that certain economic impacts associate with policy alternatives for moving current groundwater allocations to a more socially preferred set. (Zielinski-IPA)
W81-00988

ESTIMATING ECONOMIC DEVELOPMENT IMPACTS; AN ALTERNATIVE APPROACH,
Washington Univ., St. Louis. Inst. for Urban and Regional Studies.
E. Greenberg, C. L. Leven, J. T. Little, and R. P. Parks.
Institute for Water Resources Contract Report 80-C3, August, 1980. 39 p, 1 Append.

Descriptors: *Economic impact, *Water resources development, *Mathematical models, Leontief models, Model studies, Economics, Investment, Project benefits, Regional economics, Employment.

Federally financed investments have a variety of impacts on the immediate region in which they are located. An alternate approach to estimating economic development benefits is outlined for water resources projects. A critique of the typical approach to estimating economic developmental impacts indicates that traditional Leontief-type calculations are valid under certain circumstances. A more general model of economic impact uses labor as one factor and land, waterways, or recreational sites as another. In the two-factor, two-good model, the two goods represent a range of goods in the real world, one good labor intensive and the other intensive in the use of the factor which the project affects. The effects of the project are changes in technology, factor prices, or factor endowments. The impact is measured as the percentage change in Gross Regional Product due to the changes in the infrastructure. The method outlined offers a good basis for an experimental effort at estimating economic impacts of a project in an alternate way that is both more defensible theoretically and calls for less data, though of a somewhat less conventional sort. (Moore-SRC)

THE EVALUATION OF WATER CONSERVATION FOR MUNICIPAL AND INDUSTRIAL WATER SUPPLY: PROCEDURES MANUAL,
Planning and Management Consultants Ltd., Carbondale, IL.
D. D. Baumann, J. J. Boland, and J. H. Sims.
Army Engineer Institute for Water Resources Contract Report 80-1, April, 1980. 73 p, 5 Fig, 1 Tab, 2 Append.

Descriptors: *Water conservation, *Evaluation, *Municipal water, *Industrial water, Cost-benefit analysis, Planning, Water supply, Social aspects, Alternative planning, Economics, Water demand.

Water conservation proposals serve to reduce the gap between future demand and future water supply. Specific water conservation measures may be classified as regulatory practices, management practices or education efforts. The evaluation procedure is used to determine whether water supply plans can be improved by inclusion of a water conservation element. Water supply plans are first formulated according to existing procedures, without consideration of additional water conservation measures. The potential water conservation measures are identified by the measure-specific analysis; these individual water conservation measures then are evaluated against the alternate water supply plans. Based on this evaluation, water conservation proposals are developed, which can be integrated into water supply plans, yielding alternative water supply/conservation plans. Determining the social acceptability of conservation measures requires the measurement of social ideologies. Interviews and surveys can be used to delineate social ideologies which affect the social acceptability of conservation measures. Two sample questionnaires are provided. (Moore-SRC)

6E. Water Law and Institutions

CLEAN WATER ACT'S PRECEPTS TO ENDURE,
Environmental Protection Agency, Springfield, IL.
M. Mauzy.
Water and Sewage Works, Vol 127, No 10, p 38-40, October, 1980.

Descriptors: *Clean water act, *Financing, *Management, *Administration, Economics, Legislation, Permits, Water quality standards, Regulation, Monitoring, Grants, Operation.

Changes are expected during the 1980s in regard to administrative decisions affecting water quality improvement legislation. However, the magnitude of these changes is expected to be somewhat less than has been experienced in the past decade. Desires will be balanced with realistic goals. Economics will become important in the making of decisions. Attention must be given to the management of the various programs. Decentralization of program administration is recommended. Simplications are needed in the various regulations, with incentives introduced and maintained in the management levels of regulatory programs. Changes will be made in the awarding of construction grants and in the ways in which wastewater facilities are to be operated. Concern will continue in the area of toxic pollutants in the environment, and increased testing will be performed on laboratory animals to determine possible toxic effects on humans. Programs will be developed for controlling nonpoint sources of pollutants. (Baker-FRC)

FLORIDA WATER LAW 1980,
Florida Water Resources Research Center, Gainesville.
F. E. Maloney, S. J. Plager, R. C. Ausness, and B. D. E. Canter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-143430, Price codes: A99 in paper copy, A01 in microfiche. Publication No 50, 1980. 780 p, 6 Fig, 2,532 Ref. OWRT B-030-FLA(3), 14-34-0001-7113.

Descriptors: *Florida, *Water law, *Water resources development, Legislation, Judicial decisions, Planning, Legal aspects, Water pollution, Flood plain zoning, Riparian rights, Permits, Administration, Prior appropriation, Civil law, Regulation, Boundaries, Public rights, Navigation, Submerged lands.

This study is a comprehensive examination of the law respecting water use and management in the State of Florida. Common law water rights are analyzed in the first chapter, with particular attention given to the reasonable use rule. Chapter II describes the multitude of state and local agencies responsible for managing water resources in Florida. Chaper III surveys the various water allocation systems of the Eastern United States, emphasizing the Florida Water Resources Act of 1972. Common law and statutory restrictions on water pollution are analyzed in Chapter IV. The various legal doctrines governing the disposal of diffused surface waters are the subject of Chapter V. Finally, Chapter VI is concerned with submerged lands and water boundaries. The legal concept of navigability is explored and the significance of the ordinary high water mark and the mean high water line are examined.

INSTITUTIONAL CONSTRAINTS ON ALTERNATIVE WATER FOR ENERGY, A GUIDEBOOK FOR REGIONAL ASSESSMENTS.
Department of Energy Report DOE/EV/10180-01, November, 1980. 234 p, 15 Fig, 162 Ref.

Descriptors: *Groundwater, *Return flow, *Municipal wastes, *Saline water, *Water law, Constraints, *Impaired water use, *Powerplants, Groundwater mining, Irrigation systems, Sea water, Legal aspects, Political aspects, Social aspects, Sites, Thermal water, Prior appropriation, Water rights, Regulation, Regional analysis.

A guide is presented to the legal, political, and social constraints faced by energy developers in the acquistition of water from underground, irrigation return flow, municipal waste and saline sources. Water laws, environmental reporting, facility siting, and land use laws embody many of the institutional constraints relating to water acquisition. Whatever the stated rules with respect to water allocation, gaps sometimes exist between legal principles and practice. The principal legal systems for groundwater are absolute ownership, reasonable use, correlative rights and prior appropriation. In some states there are restrictions on groundwater mining, restrictions on off-site use, protection for holders of affected surface water rights and land owners, protection against unreasonable reductions in pressure or water table level, preferences for nonenergy uses, short time periods for putting water diligently to use, and uncertainties about the legal status of deep water, saline water, and geothermal water. The major constraint concerning the acquisition of municipal waste water for energy pertains to ownership. In many areas the return flow from irrigation is already covered by the water rights of downstream users. The acquisition of ocean water is not normally directly regulated; rather the intake structures, thermal discharges and siting are regulated. Social and political opposition to a project can transform what are otherwise procedural steps associated with water acquisition into major constraints and obstacles. (Moore-SRC)

THE MONOPOLIES GAME,
L. Freeman.
Water, No 34, p 22-23, September, 1980.

Descriptors: *Costs, *Efficiencies, *Water management, *Public rights, *Monopoly, Administrative agencies, Economic justification, Investigations, Legal aspects.

The United Kingdom's Monopolies and Mergers Commission has been investigating the efficiency of the Severn Trent Water Authority. The investigations were commissioned as a result of widespread consumer concern about charges levied by the Water Authority. The Commission will explain its terms of accounting to the water authority and publish its findings in advertisements in local newspapers for public comment. Many public pressure and consumer groups have already responded in writing to invitations for response from the Commission, and matters deemed worthy of further study are examined in public interest hearings. The Commission members are appointed by the Secretary of State and represent a wide range of job disciplines. Public interest hearings are attended only by water company representatives and Commission members, and all discussions are protected by the Official Secrets Act. Following hearings, reports are written up within 3 to 6 months containing the Commission's recommendations and conclusions. These reports become part of a larger full report which will be published by the Department of Trade. (Geiger-FRC)

EVALUATING THE TOXICITY OF EFFLUENTS,
Los Angeles Bureau of Sanitation, CA.
W. F. Garber.
Progress in Water Technology, Vol 12, No 3, p 57-67, 1980. 2 Fig, 2 Tab, 31 Ref.

Descriptors: *Regulation, *Toxins, *Effluents, *Standards, *Adoption of practices, Administrative decisions, Oceans, California, Toxicity, Methodology, Water pollution control, Water policy.

Major emphasis in the U.S. has been placed on setting standards and regulating toxins before scientific knowledge is established as to the toxicity of safe levels of these toxins. Limitation of the amount of toxic materials released into the environment is a major goal of a waste water treatment system. The only way to decide if known toxins should be manufactured and used, controlled by any type of treatment, or regulated by what partiticular standards, is to advance scientific knowledge of these substances. The State of California Ocean Plan, which governs the diffusion of treated wastewaters to the ocean, is described. The policies which guided its development, the methodology used to determine desired receiving water concentrations, and the resulting standards are presented and discussed. The scarcity of reliable bioassay information is emphasized. The present California standards are believed adequate to protect the environment. The federal insistence on near zero risk is believed unnecessary. (Small-FRC)

IMPLEMENTING PRETREATMENT REQUIREMENTS IN THE UNITED STATES: A STUDY OF FOUR PUBLIC AGENCIES TREATING DOMESTIC AND INDUSTRIAL WASTEWATER,
Lynam (Bart T.) and Associates, Chicago, IL.
B. T. Lynam, R. M. Linton, and K. Kirk.
Progress in Water Technology, Vol 12, No 3, p 13-21, 1980.

Descriptors: *Regulation, *Waste water treatment, *Municipal wastes, *Industrial wastes, *Toxins, Legislation, Governments, Sludge disposal, Cities, Pretreatment, Federal Water Pollution Control Act of 1972, Chattanooga, Tennessee, Rockford, Illinois, Oakland, California, New Bedford, Massachusetts.

The Association of Metropolitan Sewerage Agencies studied how four municipalities were confronting the U. S. Environmental Protection Agency's requirement that industrial users of municipal treatment systems meet pretreatment standards. The four systems: Chattanooga, Tennessee; Rockford, Illinois; Oakland, California; and New Bedford, Massachusetts, faced different problems because of differences in size, treatment process, industrial waste loadings, and geographic location. The experiences of water pollution professionals in these cities indicate that the federal requirements are achievable but start-up and operating costs are high. Industry will in general be hard-pressed to pay the costs of reasonable pretreatment. Deciding how much to charge each industry using the treatment facility is also a problem. Little is known about the 65 toxic pollutants which are regulated, and disposal of the highly toxic sludges in a cost-effective and environmentally sound fashion will be difficult. (Small-FRC)
W81-00916

THE RELATIONSHIP BETWEEN WATER CONSERVATION AND MINERAL DEVELOPMENT,
Alabama Univ. University. School of Law.
H. Cohen.
Alabama Law Review, Vol 31, No 3, p 547-609, Summer, 1980.

Descriptors: *Mineral industry, *Oil industry, *Water conservation, Mine wastes, *Legal aspects, *Industrial production, Evaluation, Planning, Mining, Coal mine wastes, Water pollution, Mine drainage, Water law, Legislation, Institutional constraints, Water policy, Governments, Oil wells, Natural gas, Waste disposal wells, Alabama, Pennsylvania.

This report briefly surveyed the background of the national energy problem and the common law applicable to the relationship between mineral production and water pollution, and discussed the water-related problems that might arise from an accelerated mineral production program. State law relative to mining and water pollution was discussed for Pennsylvania and Alabama, as well as in relation to the Federal Water Pollution Control Act (FWPCA). Although the underpinnings of the legal controls affecting both water conservation and mineral production were deemed sound, improvements in the present system were suggested. These suggestions included: (1) mapping and definition of all abandoned underground/surface mines and oil/gas wells to delineate specific effects on water resources; (2) Congressional ammendment of FWPCA and Surface Mining Control and Reclamation Act to define jurisdictional limits of EPA and the Office of Surface Mining Reclamation and Enforcement relative to mining pollution control activities; (3) new State legislation for municipalities supplying drinking water, to investigate/inspect activities that may endanger water supply; (4) State legislature definitions of pollution that includes those withdrawing large amounts of water that reduces water quality, as polluters; and (5) Congressional exemption of certain oil/gas disposal wells from Safe Drinking Water Act coverage not impacting freshwater aquifers. (Zielinski-IPA)

A HISTORY OF DRAINAGE LAW IN MINNESOTA WITH SPECIAL EMPHASIS ON THE LEGAL STATUS OF WET LANDS,
Mankato State Univ., MN. Dept. of Biological Sciences.
K. E. King.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-134900, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Research Center, University of Minnesota, Minneapolis, Bulletin 106, November, 1980. 48 p, 28 Ref, 5 Append. OWRT-A-040-MINN(6).

Descriptors: *Drainage practices, *Wetlands, *Legal aspects, *Minnesota, *Drainage effects, Drainage, Drainage patterns, Drainage programs, Evaluation, Planning, Drainage water, Water law, Water permits, Water rights, Bodies of water, Public rights, Water distribution(Applied), Jurisdiction, Institutional constraints.

A capsulized view was presented of the laws and attitudes that have shaped the drainage history of Minnesota and have formed the basis for Minnesota's present drainage law. The presentation was divided into three temporal periods: 1858-1920 (drainage period I (DP-I)), 1920-1960 (DP-II), and 1960-1979 (DP-III). DP-I in Minnesota's history was a time of extensive drainage activity. Of the total land acreage incorporated into drainage enterprises by 1960, over 79% was affected by ditching before 1920. Acts that facilitated drainage and the legal status of State water bodies were discussed for this period. DP-II represented a time of transition in State attitudes towards drainage and water; while DP-III very likely witnessed the most dramatic statutory changes in State drainage history for water resources protection and management. Special importance was placed on the evolution of the law as pertaining to wetlands. A set of appendices provided a more detailed view of certain laws and significant legal precedents. It was concluded that, if present economic patterns persist, and landowners become dissatisfied with present laws governing public waters, more drainage is likely; and, with each wetland drained, conflicts over those remaining will escalate. LEGAL, FINANCIAL AND ECONOMIC ANALYSIS OF A WATER SUPPLY BANK IN IDAHO,
Idaho Univ., Moscow. Center for Business Development and Research.
C. Hofmann, J. Wegman, and F. Damanpour.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-149486. Price codes: A07 in paper copy, A01 in microfiche. Idaho Water and Energy Resources Research Institute, University of Idaho, Technical Completion Report, August, 1980. 147 p, 3 Fig, 1 Tab, 76 Ref. OWRT-B-047-IDA(1), 14-34-0001-9112.

Descriptors: *Water allocation policy, *Legal aspects, *Economic feasibility, *Idaho, *Financial feasibility, Water supply, Pricing, Irrigation, Water districts, Water users, Water delivery, Planning, Evaluation.

Water banking can conceptually facilitate the development of rational market mechanisms for water. Idaho has authorized the establishment of a Water Supply Bank to be operated by the Idaho Water Resources Board. This study analyzes the legal, financial and economic feasibility of the Water Supply Bank. Water banking will supplement existing water transfers by water management and delivery organizations in providing access to market allocation mechanisms. While water banking can improve and facilitate the operation of market forces in water pricing and allocation, constraints on rational markets still exist. These constraints are prohibition on water transfers where adverse third-party effects are evident and institutional encumbrance which require a fixed price for the rental of storage water.

FIVE-YEAR WATER RESOURCES RESEARCH AND DEVELOPMENT GOALS, OBJECTIVES AND PRIORITIES FOR SOUTH CAROLINA, 1982-1987,
Clemson Univ., SC. Water Resources Research Inst.
P. B. Zielinski, and J. Vorgettes.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-134918, Price codes: A06 in paper copy, A01 in microfiche. Report No 91 submitted to the Office of Water Research and Technology, August, 1980. 100 p, 4 Fig, 17 Tab, 25 Ref, 1 Append.

Descriptors: *Research priorities, *South Carolina, *Planning, *Research and development, *Water quality, Water management(Applied), Water resources, Water pollution, Institutions, Optimum development plans, Desilting, Oxidation lagoons, Waste disposal, Wastes, Evaluation, Water reuse, Waste water(Pollution), Water utilization, Groundwater, Alternative planning, Project planning, Programs, Investigation, *Five-year plans.

The five-year water resources research plan for South Carolina presented background meteorological, hydrological, and geological information, a description of past/current studies, and identified water problems. Principal South Carolina water

problems were placed in three broad priority categories: those of water quality as top priority; followed by those of water resources planning and management; followed by those of water quantity. Water quality problems identified included ground/surface water pollution source identification, coastal zone groundwater pollution, waste discharges in surface waters, improved treatment performance needs for waste stabilization ponds, reduction of siltation and high nutrient levels in order to reverse lake eutrophication, and monitoring and safe disposal of toxic waste. Planning/management problems included the need for adequate groundwater data to support passage of controlling legislation; while water quantity problems included reuse and recycling of waste water effluents, and severe groundwater withdrawals in parts of the coastal plains. An estimated funding profile based on the identified priorities and covering fiscal years 1982-1986 was included. (Zielinski-IPA)

EFFECT OF NUTRIENT MANIPULATION ON PLANKTON COMMUNITY STRUCTURE,
Alaska Univ., Fairbanks. Inst. of Water Resources.
D. Lang, and E. J. Brown.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-134892, Price codes: A02 in paper copy, A01 in microfiche. Completion Report 79-10, October, 1980, 10 p, 17 Ref. OWRT-A-066-ALAS(1), 14-34-001-9002.

Descriptors: Phosphorus, Carbon, *Aquatic microorganisms, *Plankton, Species composition, Alaska, *Lakes, *Ecosystems, Nutrient requirements, *Laboratory tests, *Cultures, Evaluation, Environmental effects, Macronutrient ratios.

The primary objective of this study was to use laboratory continuous cultures to evaluate the effect of changing macronutrient ratios on the microplankton species compositions of lake ecosystems. The heterotrophic yeast could outcompete the green alga for phosphate, so the alga only predominates when carbon severly limited the growth of the yeast. Most evidence indicates that heterotrophes are better competitors for mineral nutrients (like phosphorus) than are algae. Thus, in oligotrophic systems, the total biomass of the microplankton community may be limited by a mineral nutrient, but the community structure may be regulated by the type of organisms available to the heterotrophic population. The dominance of unicellular blue-greens in oligotrophic systems (since they are better competitors for phosphorus than the yeast or green alga) may be due to their ability to take up dilute phosphorus. As nutrient concentrations increase towards eutrophy, other factors such as zooplankton grazing and allelopathy may be most important in determining the structure and biomass of the microplankton community.
W81-00973

VARIATION IN INVERTEBRATE DRIFT IN SUBARCTIC ALASKAN STREAMS,
Alaska Univ., Fairbanks. Inst. of Water Resources.
J. D. LaPerriere.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-134884, Price codes: A03 in paper copy, A01 in microfiche. Completion Report 77-22-A, August, 1980. 27 p, 1 Fig, 9 Tab, 45 Ref. OWRT-A-061-ALAS(1), 14-34-001-9002.

Descriptors: *Aquatic drift, *Benthos, *Alaska, *Invertebrates, Streams, Arctic, Subarctic, *Ecosystems, Ecological distribution, Environmental effects, Algae, Phosphorus, Alkalinity, Streamflow, Velocity, Sediment-water interfaces, Forecasting, Equations.

Data from thirteen streams in interior, subarctic Alaska are analyzed to find predictive equations that explain the amount of invertebrate fish-food drifting in the water column. The alkalinity of the water and the stream's average velocity are found to be the factors that influence the amount of drift expressed as concentration or export rate. The alkalinity is shown to be related to the invertebrates' food supply. Average velocity is speculated to be an indication of the shear force at the sediment-water interface where benthic invertebrates forage for their food. These shear forces are seen to operate on benthic invertebrates in an analogous way to that in which they operate in sediment transport. The algae of boreal streams in this region are shown to be somewhat reliant on alkalinity, but a highly significant relationship is shown between total phosphorus and algae when both muskeg (brownwater) and boreal (clearwater) streams are considered together. Brownwater streams of this region tend to have a higher total phosphorus concentration than clearwater streams, but not to have a depressed pH that is characteristic of standing waters in muskeg. Recommendations are presented for further research.

EFFECTS OF MARSH IMPOUNDMENTS ON COASTAL FISH AND WILDLIFE RESOURCES,
Louisiana State Univ., Baton Rouge. School of Forestry and Wildlife Management.
R. H. Chabreck.
In: Proceedings of the Gulf of Mexico Coastal Ecosystems Workshop, September 4-7, 1979, Port Aransas, Texas, Fore, P. L., and Peterson, R. D., Eds., Fish and Wildlife Service, Office of Environment, Report FWS/OBS-80/30, May, 1980, p 1-16. 19 Ref.

Descriptors: *Marsh management, *Wildlife management, *Impoundments, *Coastal marshes, *Environment effects, Wetlands, Marshes, Habitat improvement, Marsh plants, Hydrology, Wildlife, Freshwater marshes, Brackish water, Water resources, Fish, Vegetation, Salinity, Water birds.

Marsh impoundments are widely used in coastal regions for improving wildlife habitat, aquaculture, water storage for agricultural irrigation and industrial uses, flooding marshes for mosquito control, and maintaining favorable water depths for navigation. Impoundments can be categorized on a basis of water level and salinity regimes into four types: permanently flooded with fresh water, manipulated fresh water, permanently flooded with brackish water, and manipulated brackish water. The vegetational and hydrological characteristics of each type of impoundment are discussed, and the effects of those characteristics on providing the habitat required for waterfowl, coots, gallinules, rails, wading birds, fur animals, alligators, freshwater fishes, estuarine fishes, and crawfish are described for coastal areas of the south Atlantic and Gulf coastal wetlands are primary factors regulating their value to fish and wildlife resources. Wildlife have preferences for different species of vegetation; consequently the plant species composition of an area often governs the animal species in the area. Hydrological factors such as salinity and tidal action may affect species tolerance or regulate access to the area. (Moore-SRC)

CONTRIBUTION OF WOODED SWAMPS AND BOTTOMLAND FORESTS TO ESTUARINE PRODUCTIVITY,
Louisiana State Univ., Baton Rouge. Coastal Ecology Lab.
J. W. Day, Jr., W. H. Conner, and G. P. Kemp.
In: Proceedings of the Gulf of Mexico Coastal Ecosystems Workshop, September 4-7, 1979, Port Aransas, Texas, Fore, P. L., and Peterson, R. D., Eds., Fish and Wildlife Service, Office of Environment, Report FWS/OBS-80/30, May, 1980, p 33-50. 6 Fig, 3 Tab, 26 Ref.

Descriptors: *Estuaries, *Swamps, *Forests, *Productivity, *Hydrology, *Ecology, Environmental gradient, Wetlands, Forest management, Flow, Nutrients, Wildlife, Land management, Water management(Applied), Bottom sediments, Canal construction, Channels, Vegetation.

The value of cypress swamps and bottomland forests for wildlife habitats and water regulation is well-recognized, but studies of the ecology and management of estuaries have rarely taken the role of these freshwater systems into consideration. Swamp forests of the southeastern United States are highly productive, and this high productivity is related to water flow. Chemical dynamics of swamps are very complex and strongly affected by local physical, hydrological and geological conditions. Higher water flow generally leads to more aerobic conditions, but this is affected by sediment type. The development of an oxygenated water column and sediment surface promotes the uptake of most inorganic forms. Swamps and bottomlands also have a marked effect on hydrological patterns. The vegetation, soils and topography of swamps result in the internal stabilization of often erratic water regimes. Swamps can affect estuarine productivity by serving as nursery habitat, by contributing nutrients, and by stabilizing hydrological conditions. Hydrology is a key consideration in both the management of swamps and swamp-estuary couplings. This includes land management as it affects water movement. Important areas for management include channelization, canal construction, spoil placement and water quality. (Moore-SRC)

RECENT ADVANCES IN OUR UNDERSTANDING OF SALT MARSH ECOLOGY,
Mississippi State Univ., Mississippi State. Dept. of Biological Sciences.
A. A. de la Cruz.
In: Proceedings of the Gulf of Mexico Coastal Ecosystems Workshop, September 4-7, 1979, Port Aransas, Texas, Fore, P. L., and Peterson, R. D., Eds., Fish and Wildlife Service, Office of Environment, Report FWS/OBS-80/30, May, 1980, p 51-65. 1 Fig, 55 Ref. NA79AA-D-000-49.

Descriptors: *Coastal marshes, *Salt marshes, *Ecology, *Detritus, Wildlife, Fish, Aquatic plants, Methodology, Productivity, Food chains, Cycling nutrients, Aquatic habitats, Decomposing organic matter, Estuarine environment, Marsh management, Conservation.

The functions of the salt marsh as a producer and reservoir of energy and nutrients, and as a vital habitat for fish and wildlife have been the subject of recent studies. The main issue in marsh grass productivity studies has been methodology: the traditional Harvest Method is still the most used procedure, but not without modifications. Variability in sampling procedures and differences in the methods and formulae have prevented reliable comparisons of marsh productivity data. The energy flow in the salt marsh follows a Y-shaped pathway, the grazing food chain and the detritus food chain. The relationship between the marsh and the secondary productivity of adjacent estuarine waters depends on: the production of abundant detritus from marsh plant material; the flux of the formed plant detritus into the water that inundates the marsh; and the assimilation of detritus particles and dissolved detritus by products into the food web that supports secondary production. Caloric and nutrient analysis data from decomposing detritus of estuarine marsh species indicate that energy and protein values remain high and in most cases increase, during decomposition to particulate detritus. Marshes appear to be both sinks and sources of organic material. Most of the recent conservation and management studies are related to the habitat functions of marshes for wildlife and as sites for fish and shellfish aquacultural development.

ADAPTIVE ENVIRONMENTAL ASSESSMENT AND MANAGEMENT: AN OVERVIEW,
National Coastal Ecosystems, Team, Slidell, LA.
C. L. Cordes.
In: Proceedings of the Gulf of Mexico Coastal Ecosystems Workshop, September 4-7, 1979, Port Aransas, Texas, Fore, P. L., and Peterson, R. D., Eds., Fish and Wildlife Service, Office of Environment, Report FWS/OBS-80/30, May, 1980, p 185-189. 5 Ref.

Descriptors: *Planning, *Management, *Environmental effects, *Ecosystems, *Social aspects, *Economic impact, Alternative planning, Wildlife, Habitats, Resources development.

Resource managers and others concerned with protecting fish and wildlife, and their habitats are primarily involved in the environmental assessment process in a reactive review role. Planned developments are primarily designed within an economic context and rarely include a thorough consideration of environmental uncertainties. What often results are confrontations among representatives of various interest groups, most of whom had no opportunity to participate in the original project design. However, the methodologies of adaptive environmental assessment and management insure that environmental dimensions are integrated as equal elements with economic and social considerations at the very beginning of the development or management design process. Alternative management policies and development plans are generated in an atmosphere of open communication between developers and resource managers, and each alternative is collectively assessed for its environmental, economic, and social consequences. Flexibility is encouraged in project designs and management strategies so they may be adapted to unexpected ecological events and adjusted to benefit from information feedback throughout the development process. TRACKING MOVEMENT AND IDENTIFICATION OF IN-STREAM FLOW NEEDS OF BROWN TROUT (SALMO TRUTTA) BY USE OF RADIO-ISOTOPES,
Wyoming Univ., Laramie. Dept. of Agricultural Engineering.
L. S. Johnson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-140568, Price codes: A04 in paper copy, A01 in microfiche. M.S. Thesis, December, 1980. 66 p, 9 Fig, 7 Tab, 51 Ref, 1 Append. OWRT B-038-WYO(2), 14-34-0001-8130.

Descriptors: *Fish behavior, *Brown trout, *Tracking techniques, Telemetry, Ice cover, *Ice-water interfaces, Wyoming, Streams, *Instream flow.

Medium-sized brown trout were tracked under surface ice in a small Wyoming foothills stream. A portable single-channel analyzer and NaI (Tl) crystal and photomultiplier tube were used to locate fish implanted with 0.5 milliCuries of Antimony-124. At each fish location water depth, ice depth, mean velocity, velocity at the water surface, and substrate velocity were measured. Substrate type and cover type were also recorded. Frequency of use of various depth, velocity, and substrate classes was determined. Predictive equations were also developed relating percent habitat excluded to various parameters.

THE ANALYSIS AND FATE OF ODOROUS SULFUR COMPOUNDS IN WASTEWATERS,
Los Angeles County Sanitation Districts, Whittier, San Jose Creek Water Quality Lab. CA.
R. L. Jenkins, J. P. Gute, S. W. Krasner, and R. B. Baird.
Water Research, Vol 14, No 5, p 441-448, May, 1980. 8 Fig, 2 Tab, 18 Ref.

Descriptors: *Sulfur compounds, *Waste water treatment, *Odor, *Instrumentation, *Pollutant identification, Analytical techniques, Calibrations, Gas chromatography, Flame photometry, Sampling, Industrial wastes, Water pollution sources, Treatment facilities.

An analytical system for odorous organosulfur compounds based on gas chromatography together with the sulfur specific flame photometric detector and capable of registering data in the ppb (ml odorant/ml air) range is presented. For storage and handling of standard compounds in the calibration system, a high vacuum line was found preferable to permeation tubes as being more representative of procedures used in field analysis, even though the vacuum apparatus is more complex. The use of gas syringes was another integral feature of the calibration system. A vacuum bulb apparatus for collecting ambient air at field sites is described. The waste-water sampling device allows the odor potential of a liquid sample to enter a relatively large evacuated chamber, thus releasing volatile sulfur compounds into the headspace. Gaseous mixtures have been found less susceptible to loss when kept in aqueous solutions. The analytical system was tested by tracing and characterizing an odor incident from a treatment plant to the industrial discharge source. In cases of major odor problems, the odorant can be determined both at the treatment facility and at the point of discharge. In low or moderate odor incidents, the major odorant may derive from long-chain mercaptan decomposition in aeration treatment facilities. Mercaptan loss and alteration may also make it impossible to trace the major odorant to its source of discharge chromatographically. (Just-FRC)

FLOW-THROUGH IN SITU METABOLIMETER FOR MONITORING OXYGEN CONSUMPTION, PRODUCTION AND DIFFUSION IN NATURAL WATERS,
Fisheries Research Inst., Szarvas (Hungary).
J. Olah, A Zsigri, and P. Szabo.
Water Research, Vol 14, No 5, p 553-556, May, 1980. 2 Fig, 1 Tab, 3 Ref.

Descriptors: *Measurement, *Oxygen requirements, *Bodies of water, On-site tests, Mathematical models, Instrumentation, Eutrophication, Respiration, Diffusion, Analytical techniques.

A flow-through in situ metabolimeter was developed to measure and monitor oxygen production, consumption and diffusion directly in highly eutrophic natural waters. The instrument works by the direct measurement of the daily rhythm of both respiration and diffusion, whereby it is possible to avoid or minimize the sources of error that occur with the analytical method based on the mathematical calculation of daily oxygen curves which has been proposed by Winberg and Odum for estimating oxygen turnover. Use of the instrument allows the investigator to work without empirical and theoretical constants and hypotheses which may vary according to water type and environmental and meteorological conditons. OBTAINING PRECISE ESTIMATES IN COLIFORM ENUMERATION,
College of Staten Island, NY. Dept. of Biology.
J. M. Fleisher, and R. T. McFadden.
Water Research, Vol 14, No 5, p 477-483, May, 1980. 1 Fig, 5 Tab, 19 Ref.

Descriptors: *Bioindicators, *Water quality, *Coliforms, Water pollution, Analytical techniques, Membranes, Filtration, Fermentation, Statistical methods, Water analysis.

The use of proper experimental design and improved techniques of coliform enumeration were combined to achieve a significant improvement in the quantitative use of coliforms as water-quality indicators. Samples of water were taken from a mildly polluted beach area on Staten Island. The membrane filtration technique was used to analyze the water samples. Density estimates were analyzed by a nested analysis of variance. Up to 95% of the variation in coliform density could be ascribed to actual temporal changes in density when replicated determinations were made. Replicated determinations allowed the construction of confidence intervals about the estimates which were considerably smaller than with single determinations when the variances of the density estimates were decreased. The theoretical superiority of the membrane filtration method of water quality analysis over the multiple tube fermentation method is discussed. (Baker-FRC)

UNCERTAINTY IN DISSOLVED OXYGEN PREDICTION DUE TO VARIABILITY IN ALGAL PHOTOSYNTHESIS,
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
G. M. Hornberger.
Water Research, Vol 14, No 4, p 355-361, April, 1980. 2 Fig, 4 Tab, 28 Ref.

Descriptors: *Mathematical models, *Photosynthetic oxygen, *Dissolved oxygen, *Algae, *Monte Carlo method, Oxygen sag, Primary productivity, Time series analysis, Statistical methods, Rivers, Water quality.

Monte Carlo methods were used to evaluate the contribution of variance in river community metabolism to overall uncertainty in predictions from dissolved oxygen (DO) models. The modification of the Streeter-Phelps equation used in this work includes the effect of community metabolism on the DO balance. The results of the Monte Carlo simulations show that not only is community metabolism an important element in water quality models, but because rates of photosynthesis and respiration cannot be taken as constant, uncertainty in parameters used to model community metabolism must be considered when probability distributions of DO in rivers are estimated. This conclusion was shown to be valid for a wide range of conditions and therefore applies to all but the most heavily polluted or highly turbid waters. The observed mean daily oxygen concentrations and corresponding standard deviations for the Mechums River, the South River and the Rappahannock River are 8.36 (0.42) mg/liter, 8.35 (0.35) mg/liter, and 8.85 (0.71) mg/liter, respectively. The fact that these observed standard deviations are closely approximated by the Monte Carlo results suggests that this simulation technique may be quite useful in practice provided an estimate for the mean and variance of P-R (productivity and reaeration) can be established. Use of a refined version of the oxygen balance equation that takes into account the diel variation in algal productivity shows that variance in dissolved oxygen in rivers is likely to be much larger than that predicted by models that use mean daily values of net production. LABORATORY MANAGEMENT IN METHODS DEVELOPMENT,
PJB Labs./Jacobs Engineering, Pasadena, CA.
J. H. Taylor, C. Jackson, M. Miller, and D. R. Rushneck.
Journal of Environmental Science and Health. A, Vol 15, No 5, p 393-411, 1980. 10 Fig, 1 Tab, 2 Ref.

Descriptors: *Analytical techniques, *Gas chromatography, *Pollutant identification, Management, *Laboratories, Research and development, Chemical wastes, Testing procedures, Chemical industry, Laboratory tests.

Management practices employed in operations at an analytical laboratory are surveyed. The laboratory is responsible for the Organic Chemicals Verification Project, which is intended to provide analytical methodology, analytical data, and engineering information to characterize product/process wastewaters from EPA designated organic chemicals manufacturing plants. Using samples obtained at the plants, the laboratory is to analyze the in-process and waste streams for the Consent Decree Priority Pollutants. The organizational structure that is necessary to the operation is de-

tailed, and information is provided on the tools used to maintain operational control, such as status sheets, work order forms, and flow diagrams. The development of specific methods to meet the needs of specific projects is described. Three major managerial precepts used to accomplish the program include the use of a well-defined set of program objectives and priorities, assuming that technical solutions do exist and then locating and employing these technical solutions, and the development of methods that result in the simplest, most cost-effective analysis. Information is given on scheduling, logistics and cost accounting. To date, methods have been developed for a total of 78 streams from nine organic chemicals manufacturing plants. All but three of these streams were able to be monitored using only GC, not GC/MS methods. (Baker-FRC)

ZOOPLANKTON GRAZING AS A CONTROL MECHANISM IN ALGAL BLOOMS. A METHOD FOR THE STUDY OF THE EFFECT OF ALGAL TOXINS ON ZOOPLANKTON VERTICAL MIGRATION,
New Hampshire Univ., Durham. Dept. of Zoology.
J. F. Haney.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-143364, Price codes: A03 in paper copy, A01 in microfiche. Water Resource Research Center, University of New Hampshire, Research Report 31, 1980. 24 p, 12 Fig, 9 Ref. OWRT-A-053-NH(1), 14-34-0001-9031.

Descriptors: *Zooplankton, *Algal toxins, *Vertical migration, *Chaoborus, *Daphnia, Aquatic life, Algal blooms, Toxins, Blue-green algae, Cyanophyta, Laboratory tests, Analytical techniques, Monitoring, *Diel migration, Echo sounder, Algal extract, Sonar recorder.

A method was developed to study the effect of blue-green alga toxins on the diel vertical migration of zooplankton. The usefulness of a high-frequency echo sounder to follow the diel movements of zooplankton was first tested in the field. Zooplankton were then placed in model lake systems (2.5 m high columns) in the laboratory. The echo sounder was modified to reduce the wave length of the sound output, thereby increasing the vertical resolution characteristics. Other modifications were also made to adapt the unit for use in these shallow systems. Maximum resolution was obtained by interfacing the sonar recorder with anoscilloscope so that the vertical position of individual zooplankton (Chaoborus and Daphnia) could be determined plus or minus 2.5 cm in a 200 cm column of water. Studies were conducted to calibrate the position and width of sonar traces against visual counts of the vertical distribution of animals in the columns. A monitoring system was designed to automatically track the movements of populations of zooplankton at 15 to 30 minute intervals over 24-hour periods. Size and shape of the columns should be matched to the sound characteristics of the sonar to avoid interference from multiple echos and artifacts caused by echos form the sides of the column. Preliminary studies of the effects of soluble toxins extracted from a bloom of blue-green algae indicate sublethal doses may alter the timing and extent of the vertical migration.

THE APPLICATION AND CONDUCT OF RING TESTS IN AQUATIC TOXICOLOGY,
Unilever Research Colworth/Welwyn Lab., Bedford (England).
M. J. How.
Water Research, Vol 14, No 4, p 293-296, April, 1980. 1 Tab, 8 Ref.

Descriptors: *Reviews, *Aquatic environment, *Testing procedures, *Toxicity, Lethal limits, Water pollution, Laboratory tests, Aquatic animals, Standards, Data collections, Networks, Analytical techniques.

In this letter to the editor, some aspects of the ring test (collaborative test) as applied to aquatic toxicology are reviewed. Ring tests generally employ several laboratories to determine the toxicity of a specific chemical to a certain organism under predetermined conditions. Standard methods are essential during ring tests, and each laboratory should be supplied with detailed testing procedures. It is recommended that the agreed-upon method be tested by one laboratory for sensitivity and practicality. Full ring tests are costly exercises. Compounds to be tested should be stable, representative of actual aquatic pollutants, and free of other contaminants. Strict adherence to time schedules is important for participating laboratories. Experimental design starts with mini-ring tests, followed by the actual ring test, then the reporting of LC50 values with 95% confidence limits. The organizational flow chart for ring tests is presented. It is stressed that these tests should only be conducted when necessary. (Geiger-FRC)

THE CAVTAT ACCIDENT: EVALUATION OF ALKYL LEAD POLLUTION BY SIMULATION AND ANALYTICAL STUDIES,
Istituto di Recercha sulle Acque Bari (Italy).
G. Tiravanti, A. Rozzi, M. Dall Aglio, W. Delaney, and A. Dadone.
Progress in Water Technology, Vol 12, No 1, p 49-65, 1980. 5 Fig, 4 Tab, 23 Ref.

Descriptors: *Lead, *Analytical techniques, *Model studies, Sediments, Sea water, Water pollution sources, Ships, Tetraethyl lead, Tetramethyl lead, Adriatic Sea.

Potential marine and coastal pollution by alkyl lead was evaluated by mathematical models, and specific field and laboratory procedures were developed for lead analysis in sea water. These strategies were developed following the sinking of the Yugoslavian cargo ship Cavtat to a depth of 93 m in the Adriatic Sea. The Cavtat carried 325 tons of tetraethyl and teramethyl lead. A mathematical model capable of simulating the diffusive and convective transport of released lead is presented, including the numerical solution. Analytical and numerical solutions of the diffusion model agree well for locations farther than 200 m downstream from the source. Specific field and laboratory procedures were developed for lead analysis in sea water. Sea water samples collected 100 m to several kilometers from the wreck gave lead values lower than 0.1 microgram/liter. The average lead concentrations in sediments were 15 ppm, which is normal for marine sediments. Lead levels were also normal in biota sampled before, during, and after recovery operations. (Small-FRC)

Descriptors: *Remote sensing, *Aerial photography, *Soil-water-plant relationships, *Saline water, *Seepage, Detection, Thermal radiation, Photogrammetry, Reflectivity, Seismic, Investigations, Electrical prospecting, Saline seeps, Growth rates, Montana, North Dakota, South Dakota.

The purpose of this study was to develop and test remote sensing techniques for detection of potential sites for seep development, for detection of seeps in an early stage of development and for monitoring the rate of growth of active seeps. Due to the regional nature of the problem, test sites were selected in Montana, North Dakota, and South Dakota. Aerial photography and thermal data were supported by ground truth on each site. The data collected did not relate well to digitized data from remote sensing products. Apparently the saline seep-soil-crop complex included variability not accounted for by the data collected. However, trained photointerpreters can delineate saline seeps using photo data products with reasonable degree of accuracy (70 to 80%) if they understand seep mechanisms, soils, and geology as well as photo interpretation methods. Incipient and latent seeps were difficult to identify regardless of the data products used for interpretation. Thermal imagery may be useful in locating wet zones that are potential seeps.

SURFACE-WATER AVAILABILITY, GREENE COUNTY, ALABAMA,
Geological Survey, University, AL. Water Resources Div.
A. L. Knight, and M. E. Davis.
Alabama Geological Survey Map 149, 1980. 5 p, 1 Fig, 1 Tab, 11 Ref.

Descriptors: *Surface water availability, *Streamflow, *Water quality, *Alabama, Runoff, Rainfall-runoff relationships, Flow rates, Water yield, Chemical analysis, Maps, Hydrologic data, Greene County(AL).

The average annual runoff originating in Greene County, Ala., is about 16 inches or 0.8 Mgal/d (million gallons per day) per square mile. The Black Warrior and Tombigbee Rivers, at their confluence, have a combined average flow of 14,100 Mgal/d; each has a median annual 7-day low flow in excess of 300 Mgal/d. The Sipsey River, along the northern boundary of the county, has an average flow in excess of 600 Mgal/d and a median annual 7-day low flow of 45 Mgal/d.

Streams within the county have average flows less than 60 Mgal/d and median annual 7-day low flows less than 2 Mgal/d. Surface water generally contains less than 120 mg/L (milligrams per liter) dissolved solids, less than 20 mg/L chloride, and generally is soft to moderately hard. (USGS)

GEOLOGY AND WATER AVAILABILITY OF CULLMAN COUNTY, ALABAMA,
Geological Survey, Louisville, KY. Water Resources Div.
R. J. Faust, and P. O. Jefferson.
Alabama Geological Survey Map 145, 1980. 30 p, 4 Fig, 3 Plates, 3 Tab, 13 Ref.

Descriptors: *Geology, *Groundwater, *Available water, *Surface waters, *Alabama, Aquifer characteristics, Water wells, Well data, Water yield, Hydrogeology, Streamflow, Flow rates, Water storage, Water quality, Chemical analysis, Water utilization, Maps, Hydrologic data, Cullman County(AL).

The Pottsville Formation of Pennsylvanian age underlies most of Cullman County in northern Alabama. It consists mostly of interbedded sandstones and shales that dip southward about 40 feet per mile. The Bangor Limestone of Mississippian age underlies the Pottsville and crops out in a few valleys along the northern boundary of the county. The principal source of ground water in the county is the Pottsville Formation. Sandstones of the Pottsville Formation underlying low topographic areas will yield as much as 200 gal/min (gallons per minute) to individual wells 200 feet deep or less in the southeastern part of the county and 25-100 gal/min in other parts of the county. Those underlying high topographic areas generally yield less than 5 gal/min. The average flow of streams in and adjoining Cullman County is about 1,500 Mgal/d (million gallons per day) which includes about 780 Mgal/d that originates in the county. Discharge from ground-water storage is small, and most streams cease to flow during extended dry periods. Sipsey Fork and Mulberry Fork are the only streams in and adjoining Cullman County that have median annual 7-day low flows that exceed 2 Mgal/d. Chemical analyses of water in the county indicate the water is suitable for most uses, but iron concentrations in ground water exceed 0.3 mg/L (milligrams per liter) in many places. Water use in Cullman County was estimated to average 5.6 Mgal/d in 1967. (USGS)
W81-00816

AVAILABILITY OF SURFACE WATER IN LOWNDES COUNTY, ALABAMA,
Geological Survey, University, AL. Water Resources Div.
J. R. Willmon.
Alabama Geological Survey Map 153, 1980. 7 p, 3 Fig, 1 Tab, 14 Ref.

Descriptors: *Available water, *Surface waters, *Streamflow, *Water quality, *Alabama, Flow rates, Rainfall-runoff relationships, Chemical analysis, Maps, Hydrologic data, Lowndes County(AL).

The flow of streams in Lowndes County, Ala., is highest during January through April and lowest during September and October. The Alabama River, which forms the northern boundary of the county, has an average flow of 16,800 Mgal/d (million gallons per day) at the northwest corner and a 7-day Q sub 2 (median annual 7-day low flow) of more than 1,000 Mgal/d. Big Swamp Creek near Lowndesboro has an average flow of 200 and a 7-day Q sub 2 of 0.1 Mgal/d. The 7-day Q sub 2 of each of the remaining streams within the county is less than 2 Mgal/d. Lowndes County receives about 1,770 Mgal/d (52 inches) of water from rain, of which 1,190 Mgal/d returns to the atmosphere through evapotranspiration, and the remaining 580 Mgal/d appears as runoff in streams. Water from streams in the county is moderately hard to hard, has a moderately low mineral content, and is suitable for most uses. (USGS)
W81-00817

SURFACE-WATER AVAILABILITY, TUSCALOOSA COUNTY, ALABAMA,
Geological Survey, University, AL. Water Resources Div.; and Geological Survey, Austin, TX. Water Resources Div.
A. L. Knight, and M. E. Davis.
Alabama Geological Survey Map 139, 1980. 12 p, 3 Fig, 1 Tab, 13 Ref.

Descriptors: *Surface water availability, *Streamflow, *Water quality, *Alabama, Flow rates, Water yield, Low flow, Water storage, Chemical analysis, Maps, Hydrologic data, Tuscaloosa County(AL).

The average annual runoff, about 1,270 Mgal/d (million gallons per day), originating in Tuscaloosa County, Ala., is equivalent to 20 inches or 0.95 Mgal/d per square mile. The Black Warrior and Sipsey Rivers, the largest streams in the county, have average flows of 5,230 Mgal/d and 580 Mgal/d, respectively, where they leave the county, and median annual 7-day low flows in excess of 150 Mgal/d and 35 Mgal/d, respectively. North River, Big Sandy Creek, and Hurricane Creek have average flows in excess of 100 Mgal/d and median annual 7-day low flows in excess of 2 Mgal/d. Surface water generally contains less than 100 mg/L (milligrams per liter) dissolved solids, less than 10 mg/L chloride, and is soft to moderately hard. Streams having the higher hardness and the higher dissolved-solids content are in eastern Tuscaloosa County. (USGS)
W81-00818

SURFACE-WATER AVAILABILITY, ST. CLAIR COUNTY, ALABAMA,
Geological Survey, University, AL. Water Resources Div.
J. R. Harkins.
Alabama Geological Survey Map 148, 1980. 10 p, 4 Fig, 1 Tab, 9 Ref.

Descriptors: *Surface water availability, *Streamflow, *Water quality, *Alabama, Rainfall-runoff relationships, Flow rates, Low flow, Water yield, Water storage, Water temperature, Chemical analysis, Maps, Hydrologic data, St. Clair County(AL).

The Coosa River, the largest source of water in St. Clair County, Ala., has an average flow of 602 Mgal/d (million gallons per day) where it enters the county and 8,500 Mgal/d where it leaves the county, H. Neely Henry and Logan Martin Reservoirs, which extend along the eastern boundary of the county, have average storage capacities of 132,500 and 359,600 acre feet, respectively. Big Canoe Creek, which flows through the northern part of the county, is the largest stream in the county other than the Coosa River. It has an average flow of 210 Mgal/d at its confluence with H. Neely Henry Reservoir. Water in streams in St. Clair County is of good chemical quality and is suitable for most uses. Water in Big Canoe Creek is generally soft to moderately hard. Water in the Coosa River is generally soft. (USGS)
W81-00819

WATER AVAILABILITY OF BLOUNT COUNTY, ALABAMA,
Geological Survey, Louisville, KY. Water Resources Div.
R. J. Faust, and J. R. Harkins.
Alabama Geological Survey Map 141, 1980. 19 p, 4 Fig, 2 Plates, 4 Tab, 15 Ref.

Descriptors: *Available water, *Groundwater, *Surface waters, *Water quality, *Alabama, Aquifer characteristics, Water wells, Well data, Water yield, Hydrogeology, Streamflow, Flow rates, Rainfall-runoff relationships, Chemical analysis, Water utilization, Maps, Hydrologic data, Blount County(AL).

Ground water in Blount County, Ala., is obtained mostly from limestone and dolomite aquifers along the Sequatchie anticline and Murphrees Valley anticline and from sandstone aquifers in Sand Mountain and Blount Mountain synclinal areas. Wells tapping some limestone and dolomite aquifers produce as much as 1.4 Mgal/d (million gallons per day). Wells completed in sandstone of the Pottsville Formation underlying lower topographic areas may produce as much as 0.3 Mgal/d, but those completed in sandstone underlying higher topographic areas produce lesser quantities. Surface-water resources were appraised by use of average flow and 7-day Q2 (median annual 7-day minimum flow). An average flow of about 640 Mgal/d or about 1 Mgal/d per square mile originates in the county. Streamflow during low flow conditions is small; only three streams have 7-day Q2's that exceed 2 Mgal/d. Estimates of storage requirements are provided for sustained draft rates of 25 to 50% of the average flow. Water from aquifers and streams in Blount County is generally of suitable chemical quality for most uses. Water from the Pottsville Formation generally contains iron in excess of 0.3 milligram per liter and water from limestone and dolomite aquifers and from some streams during low flows is moderately hard to hard and may need treatment for certain uses. Water use in the county was about 3.2 Mgal/d in 1968 and 46 Mgal/d was diverted for use outside the county. (USGS)
W81-00820

WATER AVAILABILITY, SHELBY COUNTY, ALABAMA,
Geological Survey of Alabama, University.
V. M. Shamburger, and J. R. Harkins,.
Alabama Geological Survey Map 140, 1980. 32 p, 3 Fig, 3 Tab, 15 Ref.

Descriptors: *Available water, *Groundwater, *Surface waters, *Water quality, *Alabama, Aquifer characteristics, Water wells, Well data, Water yield, Hydrogeology, Streamflow, Flow rates, Rainfall-runoff relationships, Chemical analysis, Water utilization, Maps, Hydrologic data, Shelby County(AL).

The largest sources of ground water in Shelby County, Ala., are limestone and dolomite aquifers which are potential sources of about 0.5 Mgal/d (million gallons per day) per well. The most favorable well sites are in valleys or low topographic areas and adjacent to faults. Yields of wells rarely increase at depths greater than 350 feet except in fractured zones along faults. The major sources of surface water are the Coosa and Cahaba Rivers. The Coosa River is impounded by Lay Dam, which forms a lake of 145,000 acre-feet of water at elevation 396 feet above mean sea level. The Coosa and Cahaba Rivers have average flows of 9,400 Mgal/d and 400 Mgal/d, respectively at their lower reaches in the county. The Coosa River will provide more than 1,000 Mgal/d; whereas, the Cahaba River, Shoal Creek, and Buck Creek along their lower reaches in the county are each capable of providing water at the rate of 10 Mgal/d or more without storage. The county has an average annual precipitation of 54 inches of which about 20 inches runs off in streams. The 20 inches of runoff is equivalent to 800 Mgal/d or 1.0 Mgal/d per square mile. Ground water is of suitable chemical quality for most uses, but water from some sources may be objectionable for certain uses because of hardness or iron content. Surface water is of suitable chemical quality for most uses. Water use in the county in 1969 was estimated to be 5.6 Mgal/d, which is insignificant when compared to the total available supply. (USGS)
W81-00821

WATER AVAILABILITY IN CHILTON COUNTY, ALABAMA,
Geological Survey of Alabama, University. Water Resources Div.
J. S. Ellard, and J. R. Willmon.
Alabama Geological survey Map 146, 1980. 16 p, 3 Fig, 2 Plates, 3 Tab, 12 Ref.

Descriptors: *Available water, *Groundwater, *Surface waters, *Water quality, *Alabama, Aquifer characteristics, Water wells, Well data, Water yield, Hydrogeology, Streamflow, Flow rates, Chemical analysis, Water utilization, Maps, Hydrologic data, Chilton County(AL).

The largest sources of water in Chilton County, Ala., are sand, limestone, and dolomite aquifers,

and the Coosa River and Mulberry Creek. The principal sand aquifer in the southwestern part of the county will yield 0.5 to 1.0 Mgal/d (million gallons per day) per well. Limestone and dolomite aquifers in the northwestern part generally will yield less than 0.5 Mgal/d per well but locally will yield 0.5 Mgal/d or more. Metamorphic-rock aquifers in northern and eastern parts of the county generally yield less than 0.1 Mgal/d to individual wells. Wells developed in the principal sand aquifer range in depth form less than 100 feet along the northern margin of the aquifer to about 800 feet in the southwest corner of the county. Wells developed in limestone, dolomite, and undifferentiated metamorphic-rock aquifers are rarely drilled deeper than 300 feet. The Coosa River has an average flow of 10,100 Mgal/d and a 7-day Q sub 2 that exceeds 1,000 Mgal/d in the southeast corner of the county. Mulberry Creek, where it flows out of the county, has an average flow of about 180 Mgal/d and an estimated 7-day Q sub 2 of 34 Mgal/d. Water from aquifers and streams in Chilton County is generally of suitable chemical quality for most uses. Water from sand aquifers and metamorphic-rock aquifers is generally soft to moderately hard and locally contains iron in excess of 0.3 mg/L (milligram per litre). Water from limestone and dolomite aquifers is generally moderately hard to hard and has an iron content that is less than 0.3 mg/L. Water from streams has a low dissolved-solids content and is soft. The estimated use of water in Chilton County in 1969 was about 3 Mgal/d which is less than 1% of the quantity available. (USGS)

MAP SHOWING GROUND-WATER CONDITIONS IN THE CANYON DIABLO AREA, COCONINO AND NAVAJO COUNTIES, ARIZONA--1979,
Geological Survey, Tucson, AZ. Water Resources Div.
C. L. Appel, and D. J. Bills.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $3.50 in paper copy, 50 cents in microfiche. Geological Survey Open-File Report 80-747 (WRI), May, 1980. 1 Sheet, 9 Ref.

Descriptors: *Maps, *Groundwater, *Aquifer characteristics, *Water wells, *Water quality, Water levels, Specific conductivity, Fluorides, Arizona, Coconino County(AZ), Navajo County(AZ), Canyon Diablo area(AZ).

The Canyon Diablo area includes about 1,400 square miles in northeastern Arizona. The main source of ground water is the Coconino aquifer, which includes the Kaibab Limestone, the Coconino Sandstone, and the upper member of the Supai Formation. In places the alluvium and volcanic rocks yield water to wells and springs. Information on the map includes altitude of the water level, depth to water, and specific conductance and fluoride concentration in the water. Scale 1:125,000. (USGS)

WATER RESOURCES DATA FOR WYOMING, WATER YEAR 1979--VOLUME 1. MISSOURI RIVER BASIN,
Geological Survey, Cheyenne, WY. Water Resources Div.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-103129, Price codes: A09 in paper copy, A01 in microfiche. Geological Survey Water-Data Report WY-79-1, July, 1980. 642 p, 9 Fig.

Descriptors: *Wyoming, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Missouri River basin(WY).

Water resources data for the 1979 water year for Wyoming consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of wells. Volume 1 of this report contains discharge records for 166 gaging stations; stage only records for 1 lake; stage and contents for 11 lakes and reservoirs; water quality for 116 gaging stations, 101 ungaged stations, 70 wells and springs; and water levels for 36 observation wells. Also included are 75 crest-stage partial-record stations. Additional water data were collected at various sites, not part of the systematic data-collection program, and are published as miscellaneous measurements and analyses. This data represents that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Wyoming. (USGS)

8. ENGINEERING WORKS

8A. Structures

THE DESIGN AND CONSTRUCTION OF THE P K LE ROUX DAM,
Department of Water Affairs, Pretoria (South Africa). Engineering Dept.
A. G. Davies.
The Civil Engineer in South Africa (Johannesburg), Vol 20, No 10, p 249-259, October, 1978. 15 Fig, 12 Ref.

Descriptors: *Dam design, *Construction, *Engineering geology, Concrete-dams, Dams, Dam foundation, Flood control, Overflow, Seepage, Sediment control, Rock mechanics, Design flood, Topography, Structural behavior, Hydroelectric power, River flow, Erosion, Scour, Statistics, South Africa.

The logistics, engineering, and geological factors involved in the design and construction of the P K le Roux Dam, Orange River Project, South Africa, is described. It is South Africa's highest and second largest dam, 108 m high with a crest length of 770 m and a full supply capacity of 3,255 million cubic meters of water. The location is about 124 km downstream of the Hendrik Verwoerd Dam. The dam was constructed on a dolerite sill in a deep narrow gorge. The meridians of the arch are logarithmic spirals symmetrical about an axis down river and the radius of curvature increases from crown to flanks. The dam is exposed to flash floods and it has a free overspill with a crest length of 212 m. The overspill apron extends downstream to prevent scour of the foundation. Silt outlet and a gated spillway are provided for efficient operation and maintenance. The instrumentation, concreting, cooling system, and hydroelectric power station of the dam are described in detail. The construction phases of the dam are outlined and the methods used for river diversion are explained. All engineering statistics and construction dates are listed. (Sidney-IPA)

In: Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations, May 15-16, 1979, Clemson, South Carolina, Clugston, J.P. Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/28, April, 1980, p 125-146. 5 Fig, 5 Tab, 13 Ref.

Descriptors: *Pumped storage, *Mathematical models, *Limnology, *Thermal stratification, *Hydroelectric plants, Climates, Reservoirs, Thermoclines, Water temperature, Heat balance, Mixing.

A mathematical model of vertical temperature structure is presented for a typical pumped storage power plant system where water is cycled between a natural lake (lower reservoir) and an artificial (upper) reservoir. Thermocline models, wind mixing, vertical diffusion, meterorological forces, pumped storage operation, thermal energy balance, and heat exchange in the upper reservoir are considered in developing the pumped storage model. In order to demonstrate the synergetic effects of the perturbations introduced into a lake by a pumped storage power plant, the natural temperature and mixing regime of Lake Lucerne is exposed to a hypothetical pumped storage power plant. The main effect of pumped storage lies in a delay of the onset of the stagnation period from mid March to mid May. At the surface the warming of the water is delayed by a little more than one month. The seeming paradox of lower surface temperature and larger heat content is resolved by the permanent existence of a thermocline between 8 and 12 m depth. The pumped storage plant causes an increase in the vertical heat transport into the lake accompanied by a slight temperature increase below 8 m. (Moore-SRC)

COMBINED USE OF PHYSICAL AND MATHEMATICAL MODELS IN EVALUATING THE EFFECTS OF PUMPED STORAGE OPERATION ON THE THERMAL STRUCTURE OF A RESERVOIR,
Worcester Polytechnic Inst., Holden, MA. Alden Research Labs.
D. N. Brocard, E. E. Adams, and S. Bloss.
In: Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations, May 15-16, 1979, Clemson, South Carolina, Clugston, J.P., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/28, April, 1980, p 147-157.

Descriptors: *Pumped storage, *Hydroelectric plants, *Model studies, *Thermal stratification, *Limnology, Mathematical models, Reservoirs, Water temperature, Mixing, Thermoclines.

The possible effects of a proposed pumped storage project on the thermal structure of its lower reservoir were investigated by use of the combination of a physical model and a mathematical model. Pumped storage operations were simulated in a prestratified scale model of the proposed lower reservoir and measured temperatures were used to calibrate the mixing and selective models used in the mathematical simulation. The latter was then used to predict the thermal regime of the reservoir with pumped storage. The major effect of pumped storage is to mix the upper layers of the reservoir resulting in a deepening of the epilimnion. During the spring and early summer near surface temperatures are increased by 1 to 2 degrees C while at middle depths temperatures are increased substantially. Below the level of the tailrace there is little change. During the late summer the surface begins to cool, convective mixing takes place, and the thickness of the epilimnion increases rapidly. The increased heat content now results in surface temperatures which are higher during pumped storage operation than under natural conditions. There is also a larger temperature difference below the tailrace. (Moore-SRC)

EFFECTS OF VERTICAL SCALE DISTORTION ON THE PERFORMANCE OF THERMAL-HYDRAULIC MODELS OF PUMPED STORAGE SYSTEMS,
West Virginia Univ., Morgantown. Dept. of Mechanical Engineering and Mechanics.
R. A. Bajura, and S. H. Schwartz.
In: Proceedings of the Clemson Workshop on Environmental Impacts of Pumped Storage Hydroelectric Operations, May 15-16, 1979, Clemson, South Carolina, Clugston, J.P., Ed., Fish and Wildlife Service, Office of Biological Services, Report FWS/OBS-80/28, April, 1980, p 158-176. 9 Fig, 8 Ref.

Descriptors: *Pumped storage, *Hydroelectric plants, *Model studies, *Thermal stratification, Reservoirs, Water temperature, Limnology, Hydraulics.

Since most reservoirs are exceedingly broad compared to their depth, the scaled depth in a thermal-hydraulic model may be unacceptably small. One solution to this modeling dilemma is the use of a distorted model in which the vertical depth is exaggerated. A model of a hypothetical pumped storage facility was constructed at a scale ratio of 1:240 for the undistorted case. Two other models were constructed with distortion ratios of 3 and 5. Tests were conducted for a range of Froude numbers from 2 to 10 for both the generation and pumpback modes of operation for the three tailrace models. The amount of warm water injected was varied between 7% and 25% of the initial volume of the model reservoir. It is concluded that the effect of vertical scale distortion on the perform-

ance of a thermal-hydraulic model of a pumped storage reservoir outlet is significant. Distorted models are characterized by a greater degree of mixing and lower surface temperatures as compared to the undistorted model. (Moore-SRC)

8D. Soil Mechanics

DEVELOPMENT OF PHREATIC SURFACES IN EARTH EMBANKMENTS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
C. S. Desai, and T. Kuppusamy.
Report VPI-E-80.22 to Water and Power Resources Service, May, 1980. 54 p, 34 Fig, 12 Ref.

Descriptors: *Free surfaces, *Model studies, *Embankments, *Earth dams, *Seepage, Earthworks, Water levels, Reservoirs, Hydraulic models, Soil stability, Soil water, Computer models.

Transient or time dependent movements in water levels caused by rise and drawdown in the reservoir can influence significantly the stability and integrity of dams or embankments that retain the reservoir. The fluctuations in water level cause transient seepage in the dam and such flow is accompanied by the existence of the free or phreatic surface. The computer code called SEEP-2DFE has been modified, and used to study free surface locations due to a rise in reservoir level. In order to verify the predictions from finite element computations, a laboratory model was designed and constructed, using glass beads to simulate soil media. Comparisons between predictions and observations were satisfactory. A parametric study was performed by using the code to investigate the possibility of the overshooting phenomenon in a zoned dam. It indicated that in the upstream shell and core regions, the phreatic surface rose monotomically and did not show overshooting. A small amount of overshooting was seen in the downstream shell area. W81-00951 2I

CHLOROPHYTA
The Effect of Photochemical Treatment of Water on Algal Growth,
W81-00771 4A

A Comparison of the Influence of Iron on the Growth and Nitrate Metabolism of Anabaena and Scenedesmus,
W81-00808 5C

CLAY MINERALS
Interaction of Bacteriophage R17 and Reovirus Type III with the Clay Mineral Allophane,
W81-00781 5G

CLAYS
Virus Interactions with Soil Components: Measurements and Use for Predicting Movement During Land Application of Municipal Wastewater,
W81-00930 5B

CLEAN WATER ACT
Clean Water Act's Precepts to Endure,
W81-00798 6E

CLIMATOLOGY
On the Eleven-Year Solar Cycle and River Flow,
W81-00778 2E

COAGULATION
Some Dimensionless Parameters of Impeller Power in Coagulation-Flocculation Processes,
W81-00791 5D

Influence of Fulvic Acid on the Removal of Trace Concentrations of Cadmium(II), Copper(II), and Zinc(II) from Water by Alum Coagulation,
W81-00807 5D

Application of Water Extract of Brown Coal Fly Ash to Phosphate Precipitation From Polluted Waters,
W81-00928 5D

COASTAL MARSHES
Effects of Marsh Impoundments on Coastal Fish and Wildlife Resources,
W81-00991 6G

Recent Advances in our Understanding of Salt Marsh Ecology,
W81-00994 6G

Managing Impacts of Petroleum Development in Brackish Marshes,
W81-00998 5C

COASTS
Processes Controlling Virus Inactivation in Coastal Waters,
W81-00788 5E

COHO SALMON
Acute Toxicity and Behavioral Responses of Coho Salmon (Oncorhynchus Kisutch) and Shiner Perch (Cymatogaster Aggregata) to Chlorine in Heated Sea-Water.
W81-00786 5C

COLIFORMS
Obtaining Precise Estimates in Coliform Enumeration,
W81-00782 7B

Reduction of Coliform Bacteria in Two Upland Reservoirs: The Significance of Distance Decay Relationships,
W81-00785 5A

Microbiological Evaluation of Coastal Waters Quality in the Tyrrhenian Sea,
W81-00887 5B

Sanitary and Aesthetic Quality of the Coastal Waters of Spain,
W81-00888 5B

COLOR
The Second Stage Treatment of Biologically Treated Coal Carbonizing Wastes in Admixture with Sewage,
W81-00911 5D

COLORIMETRY
Detailed Report on the Use of Enzymatic Cycling for High Specificity and Precision in the Colorimetric Analysis of Ammonia,
W81-00987 5A

COMMUNITY DEVELOPMENT
Community Planning for Water Resources Management, A Guidebook.
W81-00970 6A

COMPARATIVE COSTS
Comparison of Costs of Four Modifications of the Activated Sludge Process: An Example Case,
W81-00877 5D

CONJUNCTIVE USE
A Systems Approach to Solving Resource Allocation Problems With Multiple Objectives,
W81-00751 4A

CONNECTICUT
Nitrate Fluctuations in Ground Water as Influenced by use of Fertilizer,
W81-00754 5B

CONSTRUCTION
The Design and Construction of the P K Le Roux Dam,
W81-00794 8A

CONTAMINATION (WATER)
Contamination of Fresh Water Aquifers by Oil Spills,
W81-00963 5B

CONTINUITY EQUATION
The Effect of Internal Mass Transfer Resistances on the Interpretation of Substrate Removal Data in the Suspended Growth System,
W81-00918 5D

COPPER
Copper Pharmacokinetics in Fish Gills-II. Body Size Relationships for Accumulation and Tolerance,
W81-00768 5C

COPPER SULFATE
Whole Lake Responses to Low Level Copper Sulfate Treatment,
W81-00947 5G

CORAL
Ecological Response to Relaxation of Sewage Stress off San Island, Oahu, Hawaii,
W81-00983 5C

COST ANALYSIS
Preliminary Studies on Combined or Separate Treatment (As Experienced With Effluents From Industries Processing Wood),
W81-00878 5D

Optimal Regional Conjunctive Water Management,
W81-00988 6B

COSTS
The Monopolies Game,
W81-00909 6E

COTTONWOODS
Riparian Habitat and Instream Flow Studies, Lower Verde River: Fort McDowell Reservation, Arizona,
W81-00756 2E

CRAYFISH
Paraquat Toxicity to Louisiana Crayfish (Procambarus ClarkII),
W81-00903 5C

CROP PRODUCTION
Saline Culture of Crops: A Genetic Approach,
W81-00953 3C

CULTURES
The Treatment of Malt Whiskey Distillery Waste Using the Fungus Geotrichum Candidum,
W81-00772 5D

Effect of Nutrient Manipulation on Plankton Community Structure,
W81-00973 6G

CYANIDE
Mechanism and Kinetics of Cyanide Ozonation in Water,
W81-00938 5D

CYANOPHYTA
A Comparison of the Influence of Iron on the Growth and Nitrate Metabolism of Anabaena and Scenedesmus,
W81-00808 5C

Toxic Substances from Freshwater Algae,
W81-00855 5C

CYCLING NUTRIENTS
The Chemical and Biological Effects of Annual Dieback of Myriophyllum Spicatum L. and the Importance Relative to Nutrient Cycling in Monroe Reservoir, Monroe Co., Indiana,
W81-00752 2H

Ecology of a Hypersaline Lagoon: The Laguna Madre,
W81-00997 5C

DAM DESIGN
The Design and Construction of the P K Le Roux Dam,
W81-00794 8A

DAMS
On the Eleven-Year Solar Cycle and River Flow,
W81-00778 2E

DAPHNIA
Zooplankton Grazing as a Control Mechanism in Algal Blooms. A Method for the Study of the Effect of Algal Toxins on Zooplankton Vertical Migration,
W81-00804 7B

DATA COLLECTIONS
Index of Streamflow and Water-Quality Records to September 30, 1978, Arctic Slope Alaska,
W81-00824 7C

Index of Streamflow and Water-Quality Records to September 30, 1978, south-Central Alaska,
W81-00825 7C

Index of Streamflow and Water-Quality Records to September 30, 1978, Yukon Basin, Alaska,
W81-00826 7C

Index of Streamflow and Water-Quality Records to September 30, 1978, Southwest Alaska,
W81-00827 7C

Index of Streamflow and Water-Quality Records to September 30, 1978, Northwest Alaska,
W81-00828 7C

Index of Streamflow and Water-Quality Records to September 30, 1978, Southeast Alaska,
W81-00829 7C

DECISION MAKING
Pumped Storage Site Selection Process as Developed by the Salt River Project, Phoenix, Arizona,
W81-00853 6A

DENITRIFICATION
Denitrification with Methanol: Microbiology and Biochemistry,
W81-00774 5D

Nitrogen Transformations in a Simulated Overland Flow Wastewater Treatment System,
W81-00934 5D

DEPTH
Determination of the Vertical Distribution of Ichthyoplankton in Lake Norman, North Carolina, Using a Discrete-Depth Sampling Design,
W81-00762 5C

DESALINATION PROCESSES
The Influence of Acceleration and Flow on Concentration Polarization in Reverse Osmosis,
W81-00971 3A

DESIGN CRITERIA
Rotating Disc Sewage Treatment System for Suburban Developments and High-Density Resorts of Hawaii,
W81-00801 5D

DETRITUS
Recent Advances in our Understanding of Salt Marsh Ecology,
W81-00994 6G

DEWATERING
On the Mechanism of Dewatering Colloidal Aqueous Solutions by Freeze-Thaw Processes,
W81-00931 5D

DIAGENESIS
Input and Early Diagenesis of Chlorophylls in a Temperate Intertidal Sediment,
W81-00951 2I

DIEL MIGRATION
Zooplankton Grazing as a Control Mechanism in Algal Blooms. A Method for the Study of the Effect of Algal Toxins on Zooplankton Vertical Migration,
W81-00804 7B

DIGITAL COMPUTERS
A Comparison of Analog and Digital Modeling Techniques for Simulating Three-Dimensional Ground-Water Flow on Long Island, New York,
W81-00830 2F

DINOFLAGELLATES
The Effect of Photochemical Treatment of Water on Algal Growth,
W81-00771 4A

DISINFECTION
Mode of Bacterial Inactivation by Chlorine Dioxide,
W81-00864 5F

An Epidemiologic Study of the Relationship between Hepatitis A and Water Supply Characteristics and Treatment,
W81-00897 5F

DISPERSION
Dispersants for Eliminating Oil Spills (Agentes Dispersantes Para Eliminar Derrames De Petroleo),
W81-00896 5B

DISSOLVED OXYGEN
Uncertainty in Dissolved Oxygen Prediction Due to Variability in Algal Photosynthesis,
W81-00787 7B

Water Quality at the TVA Raccoon Mountain Pumped Storage Plant,
W81-00847 5C

Nitrification Kinetics in Activated Sludge at Various Temperatures and Dissolved Oxygen Concentrations,
W81-00937 5D

Variations in Water Quality during Winter in Two Yukon Rivers with Emphasis on Dissolved Oxygen Concentration,
W81-00943 5B

Response of Dissolved Oxygen to Changes in Influent Organic Loading to Activated Sludge Systems,
W81-00946 5D

DISTILLERY WASTE WATER
Utilisation, Treatment and Disposal of Distillery Wastewater,
W81-00796 5D

DISTRIBUTION
Diel, Vertical and Horizontal Variations in Abundance of Larval Dorosoma SPP. in Center Hill Reservoir, Tennessee,
W81-00763 5C

Seasonal Occurrence, Distribution, and Power Plant Entrainment of Larval Fishes in Presque Isle Harbor, Lake Superior,
W81-00764 5C

DISTRIBUTION PATTERNS
Practical Considerations in the Application of Surface Fitting Techniques for Estimations of Areal Rainfall,
W81-00773 2B

DISTRIBUTION SYSTEMS
The Effectiveness of Chlorine Residuals in Inactivation of Bacteria and Viruses Introduced by Post-Treatment Contamination,
W81-00960 5F

DRAINAGE EFFECTS
A History of Drainage Law in Minnesota with Special Emphasis on the Legal Status of Wet Lands,
W81-00969 6E

The Nature and Effects of County Drainage Ditches in South Central Minnesota,
W81-00976 4A

DRAINAGE PRACTICES
A History of Drainage Law in Minnesota with Special Emphasis on the Legal Status of Wet Lands,
W81-00969 6E

DRAINAGE WATER
Rain Water Leachates of Heavy Metals in Road Surface Sediments,
W81-00950 5B

DREDGING
Analyses of Water and Dredged Material from Selected Southern Louisiana Waterways and Selected Areas in the Gulf of Mexico, 1976-78,
W81-00836 5A

Disposal of Lake Sediments Containing Arsenic,
W81-00966 5E

DRINKING WATER
Controlling Organic Compounds in Water - by Treatment,
W81-00908 5D

DRIP IRRIGATION
Treatment of Mililani STP Effluent for Drip Irrigation of Sugarcane,
W81-00984 5D

DYES
The Effect of Photochemical Treatment of Water on Algal Growth,
W81-00771 4A

E. COLI
Microbiological Evaluation of Coastal Waters Quality in the Tyrrhenian Sea,
W81-00887 5B

EARTH DAMS
Development of Phreatic Surfaces in Earth Embankments,
W81-00758 8D

EASTERN SACRAMENTO VALLEY (CA)
Ground-Water Conditions at Beale Air Force Base and Vicinity, California,
W81-00832 4B

ECOLOGY
Summary of Ecological Studies of Fishes in Muddy Run Pumped Storage Pond, Pennsylvania,
W81-00846 5C

Stream-Watershed Relations in the Missouri Ozark Plateau Province,
W81-00978 4C

Ecological Response to Relaxation of Sewage Stress off San Island, Oahu, Hawaii,
W81-00983 5C

Contribution of Wooded Swamps and Bottomland Forests to Estuarine Productivity,
W81-00993 6G

Recent Advances in our Understanding of Salt Marsh Ecology,
W81-00994 6G

Role of Seagrasses in Estuarine Systems,
W81-00995 5C

Ecology of a Hypersaline Lagoon: The Laguna Madre,
W81-00997 5C

ECONOMIC FEASIBILITY
Legal, Financial and Economic Analysis of a Water Supply Bank in Idaho,
W81-00977 6E

ECONOMIC IMPACT
A Study of the Impact of the Hugo Reservoir on Choctaw and Pushmataha Counties: A View Four Years after Completion.
W81-00881 6B

Estimating Economic Development Impacts; an Alternative Approach,
W81-00989 6B

Adaptive Environmental Assessment and Management: An Overview,
W81-00999 6G

ECONOMICS
A Systems Approach to Solving Resource Allocation Problems With Multiple Objectives,
W81-00751 4A

ECOSYSTEMS
Riparian Ecosystems: A Preliminary Assessment of Their Importance, Status, and Needs.
W81-00929 5C

Effect of Nutrient Manipulation on Plankton Community Structure,
W81-00973 6G

Variation in Invertebrate Drift in Subarctic Alaskan Streams,
W81-00974 6G

Adaptive Environmental Assessment and Management: An Overview,
W81-00999 6G

EFFECTS
Stream-Watershed Relationships in the Missouri Ozark Plateau Province,
W81-00803 4C

EFFICIENCIES
The Monopolies Game,
W81-00909 6E

EFFLUENTS
Preliminary Estimate of Mercury Pollution in the French Mediterranean (Provence-Cote d'Azur) by Studying Contamination Levels in Sediments and Benthic Organisms (Premiere estimation de la Pollution Mercurielle du Littoral Mediterraneen Francais (Provence-Cote d'Azur) par l'Etude du Degre de Contamination des Sediments et des Organisms Benthiques),
W81-00890 5A

Evaluating the Toxicity of Effluents,
W81-00915 6E

ELECTRIC POWERPLANTS
Avoidance Response of Rainbow Trout (Salmo Gairdneri) to Single-Dose Chlorination in a Power Plant Discharge Canal,
W81-00957 5C

ELECTRON MICROSCOPY
Identification of Chrysotile Asbestos by Microdiffraction,
W81-00901 5A

EMBANKMENTS
Development of Phreatic Surfaces in Earth Embankments,
W81-00758 8D

ENERGY BUDGET
Studies Directed Toward Coupling an Energy Balance Snowmelt Model to a Streamflow Runoff Model,
W81-00755 2A

ENGINEERING GEOLOGY
The Design and Construction of the P K Le Roux Dam,
W81-00794 8A

ENGLAND
Reduction of Coliform Bacteria in Two Upland Reservoirs: The Significance of Distance Decay Relationships,
W81-00785 5A

ENTERIC BACTERIA
Occurrence of Sulphate Reducing Bacteria in the Human Intestinal Flora and in the Aquatic Environment,
W81-00793 5B

ENTRAINMENT
Seasonal Occurrence, Distribution, and Power Plant Entrainment of Larval Fishes in Presque Isle Harbor, Lake Superior,
W81-00764 5C

Entrainment of Ichthyoplankton at Jocassee Pumped Storage Station,
W81-00842 5C

ENVIRONMENT EFFECTS
Effects of Marsh Impoundments on Coastal Fish and Wildlife Resources,
W81-00991 6G

ENVIRONMENTAL EFFECTS
Analyses of Water and Dredged Material from Selected Southern Louisiana Waterways and Selected Areas in the Gulf of Mexico, 1976-78,
W81-00836 5A

Role of the U.S. Fish and Wildlife Service in Pumped Storage Power Plant Projects,
W81-00839 5C

Whole Lake Responses to Low Level Copper Sulfate Treatment,
W81-00947 5G

Stream-Watershed Relations in the Missouri Ozark Plateau Province,
W81-00978 4C

Effects of Altered Freshwater Inflow on Estuarine Systems,
W81-00992 2L

Managing Impacts of Petroleum Development in Brackish Marshes,
W81-00998 5C

Adaptive Environmental Assessment and Management: An Overview,
W81-00999 6G

EPIDEMIOLOGY
Sanitary and Aesthetic Quality of the Coastal Waters of Spain,
W81-00888 5B

An Epidemiologic Study of the Relationship between Hepatitis A and Water Supply Characteristics and Treatment,
W81-00897 5F

EQUATIONS
Activated Sludge Control in the Secondary Settling Basin Using the Sludge Settling Analyzer,
W81-00912 5D

EQUIPMENT
A Pressurized Proportional Diluter for Aquatic Toxicological Studies,
W81-00795 5C

ESTIMATING
Practical Considerations in the Application of Surface Fitting Techniques for Estimations of Areal Rainfall,
W81-00773 2B

ESTUARIES
The Application of an Ecosystem Model to the Bristol Channel and Severn Estuary,
W81-00907 2L

Effects of Altered Freshwater Inflow on Estuarine Systems,
W81-00992 2L

Contribution of Wooded Swamps and Bottomland Forests to Estuarine Productivity,
W81-00993 6G

ESTUARINE ENVIRONMENT
Trends in Coastal Waste Treatment,

GROUNDWATER RESOURCES
Essentials of Ground-Water Hydrology Pertinent to Water-Resources Planning,
W81-00759 2F

Ground-Water Conditions at Beale Air Force Base and Vicinity, California,
W81-00832 4B

Contamination of Ground Water Supplies by Trichloroethylene--Three Case Histories,
W81-00964 5D

Underground Residence Times and Chemical Quality of Basal Groundwater in Pearl Harbor and Honolulu Aquifers, Oahu, Hawaii,
W81-00982 5B

Ground Water Overdrafting Must be Controlled.
W81-00990 4B

GROWTH RATES
The Effect of Photochemical Treatment of Water on Algal Growth,
W81-00771 4A

A Comparison of the Influence of Iron on the Growth and Nitrate Metabolism of Anabaena and Scenedesmus,
W81-00808 5C

GUAM
Well Water Quality on Moen Island, Truk,
W81-00866 5G

GULFS
The Effect of Physicochemical, Phytoplankton and Seasonal Factors on Faecal Indicator Bacteria in Northern Brackish Water,
W81-00792 5B

HARDNESS
Influence of Water Hardness on Cadmium Toxicity to Salmo Gairdneri Rich,
W81-00949 5C

HAWAII
Rotating Disc Sewage Treatment System for Suburban Developments and High-Density Resorts of Hawaii,
W81-00801 5D

Underground Residence Times and Chemical Quality of Basal Groundwater in Pearl Harbor and Honolulu Aquifers, Oahu, Hawaii,
W81-00982 5B

Ecological Response to Relaxation of Sewage Stress off San Island, Oahu, Hawaii,
W81-00983 5C

HEAT TRANSFER
Mass and Heat Transfer in a Circular Tube With Biofouling,
W81-00789 3B

HEAVY METALS
Studies on the Use of Inorganic Gels in the Removal of Heavy Metals,
W81-00872 5D

Distribution of Heavy Metals in the Superficial Marine Sediments in the Vicinity of the Rhone Mouths,
W81-00893 5B

Simplified Method for the Determination of Cadmium, Chromium, Copper, Nickel, Lead and Zinc in Sewage Sludge Using Atomic-Absorption Spectrophotometry,
W81-00899 5A

Baseline Levels of Heavy Metals in the Waters and Sediments of Baffin Bay,
W81-00905 5B

Rain Water Leachates of Heavy Metals in Road Surface Sediments,
W81-00950 5B

HUGO RESERVOIR (OK)
A Study of the Impact of the Hugo Reservoir on Choctaw and Pushmataha Counties: A View Four Years after Completion.
W81-00881 6B

HUMAN DISEASES
An Epidemiologic Study of the Relationship between Hepatitis A and Water Supply Characteristics and Treatment,
W81-00897 5F

HUMIC ACIDS
Prechlorination Treatment of Water to Reduce Chloroform Levels,
W81-00921 5F

HYDRATES
Calcium Carbonate Hexahydrate: Its Properties and Formation in Lime-Soda Softening,
W81-00923 5F

HYDROELECTRIC PLANTS
Role of the U.S. Fish and Wildlife Service in Pumped Storage Power Plant Projects,
W81-00839 5C

The Keowee-Toxaway Project,
W81-00840 5C

Predictions of Effects of Pumped Storage Hydroelectric Operations on Trout Habitat in Jocassee Reservoir, South Carolina,
W81-00841 5C

Entrainment of Ichthyoplankton at Jocassee Pumped Storage Station,
W81-00842 5C

Review of the Literature on the Effects of Pumped Storage Operations on Ichthyofauna,
W81-00843 5C

Studies of the Effects of Operating the Mt. Elbert Pumped Storage Powerplant,
W81-00844 5C

Summary of Ecological Studies of Fishes in Muddy Run Pumped Storage Pond, Pennsylvania,
W81-00846 5C

Water Quality at the TVA Raccoon Mountain Pumped Storage Plant,
W81-00847 5C

Effects of Pumpback Storage on Zooplankton Populations,
W81-00848 5C

The Impact of Pumped Storage Operation on the Vertical Temperature Structure in a Deep Lake: A Mathematical Model,
W81-00849 8B

Combined Use of Physical and Mathematical Models in Evaluating the Effects of Pumped Storage Operation on the Thermal Structure of a Reservoir,
W81-00850 8B

Effects of Vertical Scale Distortion on the Performance of Thermal-Hydraulic Models of Pumped Storage Systems,
W81-00851 8B

A Mathematical Model to Assess the Effects of Passage of Zooplankton on Their Respective Populations,
W81-00852 5C

Pumped Storage Site Selection Process as Developed by the Salt River Project, Phoenix, Arizona,
W81-00853 6A

HYDROGEOLOGY
Ground-Water Conditions at Beale Air Force Base and Vicinity, California,
W81-00832 4B

HYDROLOGIC BUDGET
EVAPOTRANSPIRATION
A Preliminary Site Evaluation Method for Treatment of Municipal Wastewater by Spray Irrigation of Forest Land,
W81-00932 3C

HYDROLOGIC DATA
Water Resources Data for Wyoming, Water Year 1979--Volume 1. Missouri River Basin,
W81-00833 7C

Water Resources Data for Idaho, Water Year 1979--Volume 1. Great Basin and Snake River Basin above King Hill.
W81-00834 7C

Water Resources Data for Idaho, Water Year 1979--Volume 2. Upper Columbia River Basin and Snake River Basin below King Hill.
W81-00835 7C

HYDROLOGY
Essentials of Ground-Water Hydrology Pertinent to Water-Resources Planning,
W81-00759 2F

Contribution of Wooded Swamps and Bottomland Forests to Estuarine Productivity,
W81-00993 6G

ICE COVER
Variations in Water Quality during Winter in Two Yukon Rivers with Emphasis on Dissolved Oxygen Concentration,
W81-00943 5B

ICE-WATER INTERFACES
Tracking Movement and Identification of In-Stream Flow Needs of Brown Trout (Salmo trutta) by Use of Radio-Isotopes,
W81-00753 7B

ICED LAKES
Penetration of Solar Radiation in Snow-Ice Covered Water Reservoirs: Winterkill,
W81-00979 2H

IDAHO
Water Resources Data for Idaho, Water Year 1979--Volume 1. Great Basin and Snake River Basin above King Hill.
W81-00834 7C

Water Resources Data for Idaho, Water Year 1979--Volume 2. Upper Columbia River Basin and Snake River Basin below King Hill.
W81-00835 7C

Legal, Financial and Economic Analysis of a Water Supply Bank in Idaho,
W81-00977 6E

IMPAIRED WATER USE
Institutional Constraints on Alternative Water for Energy, a Guidebook for Regional Assessments.
W81-00892 6E

IMPELLERS
Some Dimensionless Parameters of Impeller Power in Coagulation-Flocculation Processes,
W81-00791 5D

IMPOUNDMENTS
Effects of Marsh Impoundments on Coastal Fish and Wildlife Resources,
W81-00991 6G

INDUSTRIAL PRODUCTION
The Relationship Between Water Conservation and Mineral Development,
W81-00967 6E

INDUSTRIAL WASTES
Full-Scale Physical-Chemical-Biological Treatment of Textile Wastewaters,
W81-00873 5D

Waste Water From a Chemical-Pharmaceutical Works,
W81-00876 5D

The Second Stage Treatment of Biologically Treated Coal Carbonizing Wastes in Admixture with Sewage,
W81-00911 5D

Treatment of a Filamentous Industrial Waste in a Municipal Step Aeration Plant,
W81-00914 5D

Implementing Pretreatment Requirements in the United States: A Study of Four Public Agencies Treating Domestic and Industrial Wastewater,
W81-00916 6E

Biological Treatment of a Coal Gasification Process Wastewater,
W81-00944 5D

INDUSTRIAL WATER
The Evaluation of Water Conservation for Municipal and Industrial Water Supply: Procedures Manual,
W81-01000 6B

INFILTRATION
Field Infiltration as a Method for the Disposal of Oil-in-Water Emulsions from the Restoration of Oil-Polluted Aquifers,
W81-00920 5D

INFLOW
Effects of Altered Freshwater Inflow on Estuarine Systems,
W81-00992 2L

Studies of Freshwater Needs of Fish and Wildlife Resources in Nueces-Corpus Christi Bays, Texas,
W81-00996 2L

INLAND WATERWAYS
Analyses of Water and Dredged Material from Selected Southern Louisiana Waterways and Selected Areas in the Gulf of Mexico, 1976-78,
W81-00836 5A

INSTREAM FLOW
Tracking Movement and Identification of In-Stream Flow Needs of Brown Trout (Salmo trutta) by Use of Radio-Isotopes,
W81-00753 7B

INSTRUMENTATION
The Analysis and Fate of Odorous Sulfur Compounds in Wastewaters,
W81-00776 7B

Activated Sludge Control in the Secondary Settling Basin Using the Sludge Settling Analyzer,
W81-00912 5D

INTERTIDAL AREAS
Input and Early Diagenesis of Chlorophylls in a Temperate Intertidal Sediment,
W81-00951 2I

INVERTEBRATES
Aquatic Pests on Irrigation Systems, Identification Guide,
W81-00760 4A

Variation in Invertebrate Drift in Subarctic Alaskan Streams,
W81-00974 6G

ION EXCHANGE
Kinetics of Sorption and Desorption of HCL and Low Molecular Weight Organic Acids by Styrene and Acrylic Weak Base Resins,
W81-00867 5F

Role of Strong Ion Exchange Resins in Nitrosamine Formation in Water,
W81-00922 5A

IRON
A Comparison of the Influence of Iron on the Growth and Nitrate Metabolism of Anabaena and Scenedesmus,
W81-00808 5C

Iron Removal by Rotating Contact Reactor,
W81-00985 5D

IRRIGATION EFFICIENCY
Water-Conserving Wheat Irrigation Schedules Based on Climatic Data,
W81-00811 3F

IRRIGATION PRACTICES
Water-Conserving Wheat Irrigation Schedules Based on Climatic Data,
W81-00811 3F

Saline Culture of Crops: A Genetic Approach,
W81-00953 3C

IRRIGATION SYSTEMS
Aquatic Pests on Irrigation Systems, Identification Guide,
W81-00760 4A

IRRIGATION WASTE WATER
A Preliminary Site Evaluation Method for Treatment of Municipal Wastewater by Spray Irrigation of Forest Land,
W81-00932 3C

ISOTOPE STUDIES
Underground Residence Times and Chemical Quality of Basal Groundwater in Pearl Harbor and Honolulu Aquifers, Oahu, Hawaii,
W81-00982 5B

JOCASSEE RESERVOIR (SC)
Predictions of Effects of Pumped Storage Hydroelectric Operations on Trout Habitat in Jocassee Reservoir, South Carolina,
W81-00841 5C

KEOWEE-TOXAWAY PROJECT (SC)
The Keowee-Toxaway Project,
W81-00840 5C

KINETICS
Copper Pharmacokinetics in Fish Gills-II. Body Size Relationships for Accumulation and Tolerance,
W81-00768 5C

Nitrification Kinetics in Activated Sludge at Various Temperatures and Dissolved Oxygen Concentrations,
W81-00937 5D

Effluent Quality Variation from Multicomponent Substrates in the Activated Sludge Process,
W81-00962 5D

LABORATORIES
Laboratory Management in Methods Development,
W81-00800 7B

LABORATORY EQUIPMENT
An Apparatus for the Preparation of Varying Concentrations of Chemicals for Toxicity Tests with Aquatic Organisms,
W81-00919 5C

LABORATORY TESTS
Performance of Aerobic Digestion at Different Sludge Solid Levels and Operation Patterns,
W81-00865 5D

Combined Effects of Dodecyl Benzene Sulfonate and Low Salinities on Tisbe Bulbisetosa (Copepoda: Harpacticoida),
W81-00889 5C

Effect of Nutrient Manipulation on Plankton Community Structure,
W81-00973 6G

LAGOONS
Ecology of a Hypersaline Lagoon: The Laguna Madre,
W81-00997 5C

LAKE IVOSJON (SWEDEN)
A Mathematical Model to Assess the Effects of Passage of Zooplankton on Their Respective Populations,
W81-00852 5C

LAKE NORMAN (NC)
Determination of the Vertical Distribution of Ichthyoplankton in Lake Norman, North Carolina, Using a Discrete-Depth Sampling Design,
W81-00762 5C

LAKE SEDIMENTS
Disposal of Lake Sediments Containing Arsenic,
W81-00966 5E

LAKE SUPERIOR
Seasonal Occurrence, Distribution, and Power Plant Entrainment of Larval Fishes in Presque Isle Harbor, Lake Superior,
W81-00764 5C

LAKE TROUT
Preoperational Fishery Investigations of Twin Lakes, Colorado,
W81-00845 5C

LAKES
High Water Levels in Ground-Water Dominant Lakes--A Case Study from Northwestern Wisconsin,
W81-00810 2A

The Significance of the Predator Food Chain in Lake Metabolism,
W81-00856 5C

The Influence of Eutrophication on Deep Lake Benthic Invertebrate Communities,
W81-00858 5C

Blue-Green Algae in Lake Mjosa and other Norwegian Lakes,
W81-00859 5C

The Case of Lake Mjosa,
W81-00860 5C

Eutrophication of Alpine Lakes,
W81-00861 5C

Application of US OECD Eutrophication Study Results to Deep Lakes,
W81-00862 5C

Quantifying the Eutrophication Process: Difficulties Caused, for Example, by Sediments,
W81-00863 2K

Lake Restoration by Dilution: Moses Lake, Washington,
W81-00955 5F

Effect of Nutrient Manipulation on Plankton Community Structure,
W81-00973 6G

LAND TREATMENT
A Preliminary Site Evaluation Method for Treatment of Municipal Wastewater by Spray Irrigation of Forest Land,
W81-00932 3C

LAND USE
Expanded Flood Plain Information Study Willow, Alaska.
W81-00757 4A

Stream-Watershed Relationships in the Missouri Ozark Plateau Province,
W81-00803 4C

Stream-Watershed Relations in the Missouri Ozark Plateau Province,
W81-00978 4C

LANDFILLS
Application of Two Attenuation Mechanism Theories to a Sanitary Landfill,
W81-00959 5A

Leachate Collection Using the Ground-Water Flow System: A Landfill Case History in Central Pennsylvania,
W81-00965 5E

LARVAE
Diel Patterns of Ichthyoplankton Length-Density Relationships in Upper Watts Bar Reservoir, Tennessee,
W81-00761 5C

Determination of the Vertical Distribution of Ichthyoplankton in Lake Norman, North Carolina, Using a Discrete-Depth Sampling Design,
W81-00762 5C

Diel, Vertical and Horizontal Variations in Abundance of Larval Dorosoma SPP. in Center Hill Reservoir, Tennessee,
W81-00763 5C

Seasonal Occurrence, Distribution, and Power Plant Entrainment of Larval Fishes in Presque Isle Harbor, Lake Superior,
W81-00764 5C

Entrainment of Ichthyoplankton at Jocassee Pumped Storage Station,
W81-00842 5C

LAWNS
Distribution Patterns of Home Lawn Sprinklers,
W81-00809 3D

LEACHATE
Nitrate Fluctuations in Ground Water as Influenced by use of Fertilizer,
W81-00754 5B

Application of Two Attenuation Mechanism Theories to a Sanitary Landfill,
W81-00959 5A

Leachate Collection Using the Ground-Water Flow System: A Landfill Case History in Central Pennsylvania,
W81-00965 5E

LEACHING
A Convenient Parameter for Tracing Leachate from Sanitary Landfills,
W81-00942 5A

Rain Water Leachates of Heavy Metals in Road Surface Sediments,
W81-00950 5B

LEAD
The Cavtat Accident: Evaluation of Alkyl Lead Pollution by Simulation and Analytical Studies,
W81-00895 7B

Effect of Lead Speciation on Toxicity,
W81-00902 5C

Lead in the Marine Environment,
W81-00904 5C

Methylation of Lead in Marine Sediments,
W81-00906 5B

LEGAL ASPECTS
The Relationship Between Water Conservation and Mineral Development,
W81-00967 6E

A History of Drainage Law in Minnesota with Special Emphasis on the Legal Status of Wet Lands,
W81-00969 6E

Legal, Financial and Economic Analysis of a Water Supply Bank in Idaho,
W81-00977 6E

LETHAL LIMIT
Copper Pharmacokinetics in Fish Gills-II. Body Size Relationships for Accumulation and Tolerance,
W81-00768 5C

LIGNINS
Semi-Quantitative Determination of Fulvic Acid, Tannin and Lignin in Natural Waters,
W81-00868 5A

LIME
Calcium Carbonate Hexahydrate: Its Properties and Formation in Lime-Soda Softening,
W81-00923 5F

LIMITING FACTORS
Interacting Limits to Algal Growth: Light, Phosphorus, and Carbon Dioxide Availability,
W81-00777 5C

LIMNOLOGY
The Impact of Pumped Storage Operation on the Vertical Temperature Structure in a Deep Lake: A Mathematical Model,
W81-00849 8B

Combined Use of Physical and Mathematical Models in Evaluating the Effects of Pumped Storage Operation on the Thermal Structure of a Reservoir,
W81-00850 8B

Quantifying the Eutrophication Process: Difficulties Caused, for Example, by Sediments,
W81-00863 2K

Eutrophication in Relation to the Load of Pollution,
W81-00883 2K

LININGS
Leachate Collection Using the Ground-Water Flow System: A Landfill Case History in Central Pennsylvania,
W81-00965 5E

LONG ISLAND (NY)
A Comparison of Analog and Digital Modeling Techniques for Simulating Three-Dimensional Ground-Water Flow on Long Island, New York,
W81-00830 2F

LOW FLOW AUGMENTATION
Green River Basin Optimization - Simulation Model,
W81-00806 6A

MANAGEMENT
Clean Water Act's Precepts to Endure,
W81-00798 6E

A Few Thoughts on Waste,
W81-00812 5D

Managing Impacts of Petroleum Development in Brackish Marshes,
W81-00998 5C

Adaptive Environmental Assessment and Management: An Overview,
W81-00999 6G

MAPS
Map Showing Ground-Water Conditions in the Canyon Diablo Area, Coconino and Navajo Counties, Arizona--1979,
W81-00823 7C

MARINE BACTERIA
Processes Controlling Virus Inactivation in Coastal Waters,
W81-00788 5E

MARINE PLANTS
Role of Seagrasses in Estuarine Systems,
W81-00995 5C

MARSH MANAGEMENT
Effects of Marsh Impoundments on Coastal Fish and Wildlife Resources,
W81-00991 6G

MASS TRANSFER
Mass and Heat Transfer in a Circular Tube With Biofouling,
W81-00789 3B

The Effect of Internal Mass Transfer Resistances on the Interpretation of Substrate Removal Data in the Suspended Growth System,
W81-00918 5D

MATHEMATICAL MODELS
Optimal Periodic Control of Activated Sludge Processes: II. Comparison With Conventional Control for Structured Sludge Kinetics,
W81-00769 5D

Denitrification with Methanol: Microbiology and Biochemistry,
W81-00774 5D

Uncertainty in Dissolved Oxygen Prediction Due to Variability in Algal Photosynthesis,
W81-00787 7B

Mass and Heat Transfer in a Circular Tube With Biofouling,
W81-00789 3B

The Impact of Pumped Storage Operation on the Vertical Temperature Structure in a Deep Lake: A Mathematical Model,
W81-00849 8B

A Mathematical Model to Assess the Effects of Passage of Zooplankton on Their Respective Populations,
W81-00852 5C

Activated Sludge Control in the Secondary Settling Basin Using the Sludge Settling Analyzer,
W81-00912 5D

Effluent Quality Variation from Multicomponent Substrates in the Activated Sludge Process,
W81-00962 5D

Effects of Changes in Surface Water Regime and/or Land Use on the Vertical Distribution of Water Available for Wetland Vegetation, Part I, Dynamic Model of the Zone of Aeration,
W81-00968 4A

Estimating Economic Development Impacts; an Alternative Approach,
W81-00989 6B

MATHEMATICAL STUDIES
Practical Considerations in the Application of Surface Fitting Techniques for Estimations of Areal Rainfall,
W81-00773 2B

On the Eleven-Year Solar Cycle and River Flow,
W81-00778 2E

Mechanism and Kinetics of Cyanide Ozonation in Water,
W81-00938 5D

MEASUREMENT
Flow-Through in Situ Metabolimeter for Monitoring Oxygen Consumption, Production and Diffusion in Natural Waters,
W81-00779 7B

MERCURY
Preliminary Estimate of Mercury Pollution in the French Mediterranean (Provence-Cote d'Azur) by Studying Contamination Levels in Sediments and Benthic Organisms (Premiere estimation de la Pollution Mercurielle du Littoral Mediterraneen Francais (Provence-Cote d'Azur) par l'Etude du Degre de Contamination des Sediments et des Organisms Benthiques),
W81-00890 5A

METHODOLOGY
Catchment Quality Control,
W81-00854 5G

Effects of Eutrophication on Zooplankton,
W81-00857 5C

Detailed Report on the Use of Enzymatic Cycling for High Specificity and Precision in the Colorimetric Analysis of Ammonia,
W81-00987 5A

MICROBIAL DEGRADATION
Model Studies of the Degradation of Acrylamide Monomer.
W81-00925 5B

MICROORGANISMS
Estimation of Nitrifying Biomass and Kinetics in Wastewater,
W81-00780 5D

Treatment of a Filamentous Industrial Waste in a Municipal Step Aeration Plant,
W81-00914 5D

Microbial Dynamics of Two Sub-Arctic Canadian Rivers,
W81-00956 5C

MICROSTRAINERS
Investigation to Replace the Conventional Sedimentation Tank by a Microstrainer in the Rotating Disc System,
W81-00797 5D

MINERAL INDUSTRY
The Relationship Between Water Conservation and Mineral Development,
W81-00967 6E

MINERALS
Stream Cation Concentrations and Losses from Drainage Basins with Contrasting Land Uses in Southern Ontario,
W81-00941 5C

MINNESOTA
A History of Drainage Law in Minnesota with Special Emphasis on the Legal Status of Wet Lands,
W81-00969 6E

The Nature and Effects of County Drainage Ditches in South Central Minnesota,
W81-00976 4A

MINNOWS
Long-Term Effects of PCB (Clophen A50) on Growth, Reproduction and Swimming Performance in the Minnow, Phoxinus Phoxinus,
W81-00958 5C

MISSISSIPPI RIVER
Paraquat Toxicity to Louisiana Crayfish (Procambarus ClarkII),
W81-00903 5C

MISSOURI
Stream-Watershed Relationships in the Missouri Ozark Plateau Province,
W81-00803 4C

Stream-Watershed Relations in the Missouri Ozark Plateau Province,
W81-00978 4C

MISSOURI PLATEAU PROVINCE
Stream-Watershed Relations in the Missouri Ozark Plateau Province,
W81-00978 4C

MISSOURI RIVER BASIN (WY)
Water Resources Data for Wyoming, Water Year 1979--Volume 1. Missouri River Basin,
W81-00833 7C

MIXING
The Effect of Plant Configuration on Sludge Bulking,
W81-00874 5D

MODE OF ACTION
Mode of Bacterial Inactivation by Chlorine Dioxide,
W81-00864 5F

MODEL STUDIES
A Systems Approach to Solving Resource Allocation Problems With Multiple Objectives,
W81-00751 4A

Development of Phreatic Surfaces in Earth Embankments,
W81-00758 8D

Development of Models to Predict Quality of Runoff Water from Agricultural Watersheds,
W81-00805 5B

Green River Basin Optimization - Simulation Model,
W81-00806 6A

A Comparison of Analog and Digital Modeling Techniques for Simulating Three-Dimensional Ground-Water Flow on Long Island, New York,
W81-00830 2F

Combined Use of Physical and Mathematical Models in Evaluating the Effects of Pumped Storage Operation on the Thermal Structure of a Reservoir,
W81-00850 8B

Effects of Vertical Scale Distortion on the Performance of Thermal-Hydraulic Models of Pumped Storage Systems,
W81-00851 8B

Application of US OECD Eutrophication Study Results to Deep Lakes,
W81-00862 5C

Floc Size, Filament Length and Settling Properties of Prototype Activated Sludge Plants,
W81-00875 5D

The Cavtat Accident: Evaluation of Alkyl Lead Pollution by Simulation and Analytical Studies,
W81-00895 7B

Effect of Lead Speciation on Toxicity,
W81-00902 5C

The Application of an Ecosystem Model to the Bristol Channel and Severn Estuary,
W81-00907 2L

Model Studies of the Degradation of Acrylamide Monomer.
W81-00925 5B

A Mathematical Model Simulating Fish Losses Near Power Plants Using Rotenone Data,
W81-00933 5C

Nitrogen Transformations in a Simulated Overland Flow Wastewater Treatment System,
W81-00934 5D

Aeration as a Tool to Improve Water Quality and Reduce the Growth of Hydrilla,
W81-00961 4A

Penetration of Solar Radiation in Snow-Ice Covered Water Reservoirs: Winterkill,
W81-00979 2H

Optimal Regional Conjunctive Water Management,
W81-00988 6B

MONITORING
Evaluation of Procedures for Recovery of Viruses From Water-II. Detection Systems,
W81-00767 5A

Biological Monitoring. Part I-Early Warning Systems,
W81-00880 5A

Trends in Coastal Waste Treatment,
W81-00891 5D

Whole Lake Responses to Low Level Copper Sulfate Treatment,
W81-00947 5G

An Approach to Chemical and Biological River Monitoring Systems,
W81-00952 5C

MONOPOLY
The Monopolies Game,
W81-00909 6E

MONROE RESERVOIR (IN)
The Chemical and Biological Effects of Annual Dieback of Myriophyllum Spicatum L. and the Importance Relative to Nutrient Cycling in Monroe Reservoir, Monroe Co., Indiana,
W81-00752 2H

MONTE CARLO METHOD
Uncertainty in Dissolved Oxygen Prediction Due to Variability in Algal Photosynthesis,
W81-00787 7B

MORBIDITY
Sanitary and Aesthetic Quality of the Coastal Waters of Spain,
W81-00888 5B

MORTALITY
Review of the Literature on the Effects of Pumped Storage Operations on Ichthyofauna,
W81-00843 5C

A Mathematical Model to Assess the Effects of Passage of Zooplankton on Their Respective Populations,
W81-00852 5C

Paraquat Toxicity to Louisiana Crayfish (Procambarus ClarkII),
W81-00903 5C

A Mathematical Model Simulating Fish Losses Near Power Plants Using Rotenone Data,
W81-00933 5C

MUNICIPAL WASTES
Rotating Disc Sewage Treatment System for Suburban Developments and High-Density Resorts of Hawaii,
W81-00801 5D

Institutional Constraints on Alternative Water for Energy, a Guidebook for Regional Assessments.
W81-00892 6E

Implementing Pretreatment Requirements in the United States: A Study of Four Public Agencies Treating Domestic and Industrial Wastewater,
W81-00916 6E

A Convenient Parameter for Tracing Leachate from Sanitary Landfills,
W81-00942 5A

MUNICIPAL WATER
The Evaluation of Water Conservation for Municipal and Industrial Water Supply: Procedures Manual,
W81-01000 6B

MYRIOPHYLLUM SPICATUM
The Chemical and Biological Effects of Annual Dieback of Myriophyllum Spicatum L. and the Importance Relative to Nutrient Cycling in Monroe Reservoir, Monroe Co., Indiana,
W81-00752 2H

NATURAL RESOURCES
Surficial Geology of Richland Quadrangle, Oswego County, New York,
W81-00813 7C

Surficial Geology of Part of Cleveland Quadrangle, Oswego County, New York,
W81-00814 7C

Surficial Geology of Texas Quadrangle, Oswego County, New York,
W81-00837 7C

NEW YORK
Surficial Geology of Richland Quadrangle, Oswego County, New York,
W81-00813 7C

Surficial Geology of Part of Cleveland Quadrangle, Oswego County, New York,
W81-00814 7C

Surficial Geology of Texas Quadrangle, Oswego County, New York,
W81-00837 7C

NITRATES
Nitrate Fluctuations in Ground Water as Influenced by use of Fertilizer,
W81-00754 5B

Estimation of Nitrifying Biomass and Kinetics in Wastewater,
W81-00780 5D

Rapid and Sensitive Spectrophotometric Method for the Determination of Nitrate in Rain Water using 3,4-Xylenol,
W81-00900 5A

NITRIFICATION
Estimation of Nitrifying Biomass and Kinetics in Wastewater,
W81-00780 5D

Nitrification Kinetics in Activated Sludge at Various Temperatures and Dissolved Oxygen Concentrations,
W81-00937 5D

NITRITES
Determination of Nitrite Ion in Waste and Treated Waters by Resonance Raman Spectrometry,
W81-00927 5A

NITROGEN
The Chemical and Biological Effects of Annual Dieback of Myriophyllum Spicatum L. and the Importance Relative to Nutrient Cycling in Monroe Reservoir, Monroe Co., Indiana,
W81-00752 2H

Nitrogen Transformations in a Simulated Overland Flow Wastewater Treatment System,
W81-00934 5D

NITROGEN COMPOUNDS
Detailed Report on the Use of Enzymatic Cycling for High Specificity and Precision in the Colorimetric Analysis of Ammonia,
W81-00987 5A

NORTHWEST ALASKA
Index of Streamflow and Water-Quality Records to September 30, 1978, Northwest Alaska,
W81-00828 7C

NORWAY
Eutrophication of Norwegian Freshwaters in Relation to Natural Conditions,
W81-00884 5C

NUECES-CORPUS CHRISTI BAYS (TX)
Studies of Freshwater Needs of Fish and Wildlife Resources in Nueces-Corpus Christi Bays, Texas,
W81-00996 2L

NUISANCE ALGAE
Aquatic Pests on Irrigation Systems, Identification Guide,
W81-00760 4A

NUMERICAL ANALYSIS
A Comparison of Analog and Digital Modeling Techniques for Simulating Three-Dimensional Ground-Water Flow on Long Island, New York,
W81-00830 2F

NUTRIENT REMOVAL
An Evaluation of Pretreated Natural Zeolites for Ammonium Removal,
W81 00790 5D

NUTRIENTS
Heterotrophic Bacteria in Two Canadian Rivers-I. Seasonal Variations in the Predominant Bacterial Populations,
W81-00770 5C

Transport of Potential Pollutants in Runoff Water from Land Areas Receiving Animal Wastes: A Review,
W81-00775 5B

Interacting Limits to Algal Growth: Light, Phosphorus, and Carbon Dioxide Availability,
W81-00777 5C

The Effect of Physicochemical, Phytoplankton and Seasonal Factors on Faecal Indicator Bacteria in Northern Brackish Water,
W81-00792 5B

Blue-Green Algae in Lake Mjosa and other Norwegian Lakes,
W81-00859 5C

The Case of Lake Mjosa,
W81-00860 5C

Eutrophication of Alpine Lakes,
W81-00861 5C

Eutrophication in Relation to the Load of Pollution,
W81-00883 2K

Problems of Storage of Various Substances Found in the Interstitial Waters of the Surface Sediments of the French Continental Shelf,
W81-00894 5B

Aeration as a Tool to Improve Water Quality and Reduce the Growth of Hydrilla,
W81-00961 4A

The Nature and Effects of County Drainage Ditches in South Central Minnesota,
W81-00976 4A

ODOR
The Analysis and Fate of Odorous Sulfur Compounds in Wastewaters,
W81-00776 7B

OIL
Dispersants for Eliminating Oil Spills (Agentes Dispersantes Para Eliminar Derrames De Petroleo),
W81-00896 5B

OIL FIELDS
Managing Impacts of Petroleum Development in Brackish Marshes,
W81-00998 5C

OIL INDUSTRY
The Relationship Between Water Conservation and Mineral Development,
W81-00967 6E

OIL POLLUTION
Dispersants for Eliminating Oil Spills (Agentes Dispersantes Para Eliminar Derrames De Petroleo),
W81-00896 5B

Contamination of Fresh Water Aquifers by Oil Spills,
W81-00963 5B

OIL SPILLS
Field Infiltration as a Method for the Disposal of Oil-in-Water Emulsions from the Restoration of Oil-Polluted Aquifers,
W81-00920 5D

OILY WATER
Contamination of Fresh Water Aquifers by Oil Spills,
W81-00963 5B

OKLAHOMA
Water-Conserving Wheat Irrigation Schedules Based on Climatic Data,
W81-00811 3F

A Study of the Impact of the Hugo Reservoir on Choctaw and Pushmataha Counties: A View Four Years after Completion.
W81-00881 6B

ON-SITE INVESTIGATIONS
Effects of Eutrophication on Zooplankton,
W81-00857 5C

ON-SITE TESTS
Avoidance Response of Rainbow Trout (Salmo Gairdneri) to Single-Dose Chlorination in a Power Plant Discharge Canal,
W81-00957 5C

OPERATING COSTS
Comparison of Costs of Four Modifications of the Activated Sludge Process: An Example Case,
W81-00877 5D

OPTIMIZATION
Green River Basin Optimization - Simulation Model,
W81-00806 6A

A Few Thoughts on Waste,
W81-00812 5D

ORGANIC COMPOUNDS
Controlling Organic Compounds in Water - by Treatment,
W81-00908 5D

Role of Strong Ion Exchange Resins in Nitrosamine Formation in Water,
W81-00922 5A

Model Studies of the Degradation of Acrylamide Monomer.
W81-00925 5B

Determination of Trihalomethanes (THM) in Water Using High Efficiency Solvent Extraction,
W81-00936 5A

Biological Treatment of a Coal Gasification Process Wastewater,
W81-00944 5D

Response of Dissolved Oxygen to Changes in Influent Organic Loading to Activated Sludge Systems,
W81-00946 5D

Contamination of Ground Water Supplies by Trichloroethylene--Three Case Histories,
W81-00964 5D

ORGANIC LOADING
Significance of COD, BOD and TOC Correlations in Kinetic Models of Biological Oxidation,
W81-00784 5D

OSWEGO COUNTY
Surficial Geology of Richland Quadrangle, Oswego County, New York,
W81-00813 7C

OSWEGO COUNTY (NY)
Surficial Geology of Part of Cleveland Quadrangle, Oswego County, New York,
W81-00814 7C

OUTFALL SEWERS
Construction Aspects of Outfall Design for Greater Athens,
W81-00885 5E

Sewage Treatment and Effluent Disposal Options Appropriate to Mediterranean Coastal Developments as Studied for Greater Athens,
W81-00886 5E

OVERDRAFT
Ground Water Overdrafting Must be Controlled.
W81-00990 4B

OVERLAND FLOW
Nitrogen Transformations in a Simulated Overland Flow Wastewater Treatment System,
W81-00934 5D

OXIDATION
Mechanism and Kinetics of Cyanide Ozonation in Water,
W81-00938 5D

Biological Treatment of a Coal Gasification Process Wastewater,
W81-00944 5D

OXYGEN REQUIREMENTS
Flow-Through in Situ Metabolimeter for Monitoring Oxygen Consumption, Production and Diffusion in Natural Waters,
W81-00779 7B

OZONE
Mechanism and Kinetics of Cyanide Ozonation in Water,
W81-00938 5D

Ozone-Induced Biodegradability of a Non-Ionic Surfactant,
W81-00940 5B

PARAQUAT
Paraquat Toxicity to Louisiana Crayfish (Procambarus ClarkII),
W81-00903 5C

PATH OF POLLUTANTS
Distribution of Heavy Metals in the Superficial Marine Sediments in the Vicinity of the Rhone Mouths,
W81-00893 5B

A Convenient Parameter for Tracing Leachate from Sanitary Landfills,
W81-00942 5A

PHENOLS
The Production of Bromophenols Resulting from the Chlorination of Waters Containing Bromide Ion and Phenol,
W81-00871 5F

PHOENIX (AZ)
Pumped Storage Site Selection Process as Developed by the Salt River Project, Phoenix, Arizona,
W81-00853 6A

PHOSPHATES
Effect of Lead Speciation on Toxicity,
W81-00902 5C

Application of Water Extract of Brown Coal Fly Ash to Phosphate Precipitation From Polluted Waters,
W81-00928 5D

PHOSPHORUS
The Chemical and Biological Effects of Annual Dieback of Myriophyllum Spicatum L. and the Importance Relative to Nutrient Cycling in Monroe Reservoir, Monroe Co., Indiana,
W81-00752 2H

Eutrophication of Norwegian Freshwaters in Relation to Natural Conditions,
W81-00884 5C

PHOTOSYNTHETIC OXYGEN
Uncertainty in Dissolved Oxygen Prediction Due to Variability in Algal Photosynthesis,
W81-00787 7B

PHREATOPHYTES
Aquatic Pests on Irrigation Systems, Identification Guide,
W81-00760 4A

PHYSICAL PROPERTIES
Determination of Polyoxyethylene Alkyl Ether Non-Ionic Surfactants in Waters at Trace Levels as Potassium Picrate Active Substances,
W81-00898 5A

PLANKTON
Diel Patterns of Ichthyoplankton Length-Density Relationships in Upper Watts Bar Reservoir, Tennessee,
W81-00761 5C

Determination of the Vertical Distribution of Ichthyoplankton in Lake Norman, North Carolina, Using a Discrete-Depth Sampling Design,
W81-00762 5C

Effect of Nutrient Manipulation on Plankton Community Structure,
W81-00973 6G

PLANNING
Essentials of Ground-Water Hydrology Pertinent to Water-Resources Planning,
W81-00759 2F

Urban Water Supply Planning,
W81-00910 6A

Community Planning for Water Resources Management, A Guidebook.
W81-00970 6A

Five-Year Water Resources Research and Development Goals, Objectives and Priorities for South Carolina, 1982-1987,
W81-00986 6E

Adaptive Environmental Assessment and Management: An Overview,
W81-00999 6G

PLASTICS
Model Studies of the Degradation of Acrylamide Monomer.
W81-00925 5B

POISONS
Toxic Substances from Freshwater Algae,
W81-00855 5C

POLLUTANT IDENTIFICATION
The Analysis and Fate of Odorous Sulfur Compounds in Wastewaters,
W81-00776 7B

ATP as an Indicator of Toxicity,
W81-00783 5A

Laboratory Management in Methods Development,
W81-00800 7B

Identification of Chrysotile Asbestos by Microdiffraction,
W81-00901 5A

Determination of Nitrite Ion in Waste and Treated Waters by Resonance Raman Spectrometry,
W81-00927 5A

POLLUTION ABATEMENT
A Few Thoughts on Waste,
W81-00812 5D

POLYCHLORINATED BIPHENYLS
Long-Term Effects of PCB (Clophen A50) on Growth, Reproduction and Swimming Performance in the Minnow, Phoxinus Phoxinus,
W81-00958 5C

POPULATIONS
Heterotrophic Bacteria in Two Canadian Rivers-I. Seasonal Variations in the Predominant Bacterial Populations,
W81-00770 5C

POST-IMPOUNDMENT
A Study of the Impact of the Hugo Reservoir on Choctaw and Pushmataha Counties: A View Four Years after Completion.
W81-00881 6B

POTABLE WATER
Catchment Quality Control,
W81-00854 5G

An Epidemiologic Study of the Relationship between Hepatitis A and Water Supply Characteristics and Treatment,
W81-00897 5F

Field Infiltration as a Method for the Disposal of Oil-in-Water Emulsions from the Restoration of Oil-Polluted Aquifers,
W81-00920 5D

Determination of Trihalomethanes (THM) in Water Using High Efficiency Solvent Extraction,
W81-00936 5A

Evaluation of a Portable Bare-Electrode Amperometric Analyzer for Determining Free Chlorine in Potable and Swimming-Pool Waters,
W81-00945 5A

POTASSIUM
A Convenient Parameter for Tracing Leachate from Sanitary Landfills,
W81-00942 5A

POWER PLANTS
A Mathematical Model Simulating Fish Losses Near Power Plants Using Rotenone Data,
W81-00933 5C

POWERPLANTS
Institutional Constraints on Alternative Water for Energy, a Guidebook for Regional Assessments.
W81-00892 6E

PRECIPITATION (ATMOSPHERIC)
Eutrophication in Relation to the Load of Pollution,
W81-00883 2K

PREDATION
The Significance of the Predator Food Chain in Lake Metabolism,
W81-00856 5C

PRODUCTIVITY
Contribution of Wooded Swamps and Bottomland Forests to Estuarine Productivity,
W81-00993 6G

PROJECT PLANNING
Construction Aspects of Outfall Design for Greater Athens,
W81-00885 5E

Sewage Treatment and Effluent Disposal Options Appropriate to Mediterranean Coastal Developments as Studied for Greater Athens,
W81-00886 5E

PUBLIC RIGHTS
The Monopolies Game,
W81-00909 6E

PULP AND PAPER INDUSTRY
Preliminary Studies on Combined or Separate Treatment (As Experienced With Effluents From Industries Processing Wood),
W81-00878 5D

PUMPED STORAGE
Role of the U.S. Fish and Wildlife Service in Pumped Storage Power Plant Projects,
W81-00839 5C

The Keowee-Toxaway Project,
W81-00840 5C

Predictions of Effects of Pumped Storage Hydroelectric Operations on Trout Habitat in Jocassee Reservoir, South Carolina,
W81-00841 5C

Entrainment of Ichthyoplankton at Jocassee Pumped Storage Station,
W81-00842 5C

Review of the Literature on the Effects of Pumped Storage Operations on Ichthyofauna,
W81-00843 5C

Studies of the Effects of Operating the Mt. Elbert Pumped Storage Powerplant,
W81-00844 5C

Preoperational Fishery Investigations of Twin Lakes, Colorado,
W81-00845 5C

Summary of Ecological Studies of Fishes in Muddy Run Pumped Storage Pond, Pennsylvania,
W81-00846 5C

Water Quality at the TVA Raccoon Mountain Pumped Storage Plant,
W81-00847 5C

Effects of Pumpback Storage on Zooplankton Populations,
W81-00848 5C

The Impact of Pumped Storage Operation on the Vertical Temperature Structure in a Deep Lake: A Mathematical Model,
W81-00849 8B

Combined Use of Physical and Mathematical Models in Evaluating the Effects of Pumped Storage Operation on the Thermal Structure of a Reservoir,
W81-00850 8B

Effects of Vertical Scale Distortion on the Performance of Thermal-Hydraulic Models of Pumped Storage Systems,
W81-00851 8B

A Mathematical Model to Assess the Effects of Passage of Zooplankton on Their Respective Populations,
W81-00852 5C

Pumped Storage Site Selection Process as Developed by the Salt River Project, Phoenix, Arizona,
W81-00853 6A

QUALITY CONTROL
Catchment Quality Control,
W81-00854 5G

RACCOON MOUNTAIN PUMPED STORAGE PLANT (TN)
Water Quality at the TVA Raccoon Mountain Pumped Storage Plant,
W81-00847 5C

RAINBOW TROUT
Preoperational Fishery Investigations of Twin Lakes, Colorado,
W81-00845 5C

Influence of Water Hardness on Cadmium Toxicity to Salmo Gairdneri Rich,
W81-00949 5C

Avoidance Response of Rainbow Trout (Salmo Gairdneri) to Single-Dose Chlorination in a Power Plant Discharge Canal,
W81-00957 5C

RAINFALL
Practical Considerations in the Application of Surface Fitting Techniques for Estimations of Areal Rainfall,
W81-00773 2B

RAINIER MESA (NV)
The Effect of Dissolution of Volcanic Glass on the Water Chemistry in a Tuffaceous Aquifer, Rainier Mesa, Nevada,
W81-00831 2K

RECREATION
Green River Basin Optimization - Simulation Model,
W81-00806 6A

RECREATION DEMAND
River Recreation Use and Analysis of Carrying Capacity,
W81-00972 6B

REEFS
Ecological Response to Relaxation of Sewage Stress off San Island, Oahu, Hawaii,
W81-00983 5C

REGULATION
Evaluating the Toxicity of Effluents,
W81-00915 6E

Implementing Pretreatment Requirements in the United States: A Study of Four Public Agencies Treating Domestic and Industrial Wastewater,
W81-00916 6E

REMOTE SENSING
Detection of Saline Seeps.
W81-00975 7B

RESEARCH AND DEVELOPMENT
Five-Year Water Resources Research and Development Goals, Objectives and Priorities for South Carolina, 1982-1987,
W81-00986 6E

RESEARCH PRIORITIES
Five-Year Water Resources Research and Development Goals, Objectives and Priorities for South Carolina, 1982-1987,
W81-00986 6E

RESERVOIR OPERATIONS
Green River Basin Optimization - Simulation Model,
W81-00806 6A

RESERVOIR SITES
Pumped Storage Site Selection Process as Developed by the Salt River Project, Phoenix, Arizona,
W81-00853 6A

RESERVOIRS
Reduction of Coliform Bacteria in Two Upland Reservoirs: The Significance of Distance Decay Relationships,
W81-00785 5A

The Keowee-Toxaway Project,
W81-00840 5C

Water Quality at the TVA Raccoon Mountain Pumped Storage Plant,
W81-00847 5C

A Study of the Impact of the Hugo Reservoir on Choctaw and Pushmataha Counties: A View Four Years after Completion.
W81-00881 6B

RESINS
Role of Strong Ion Exchange Resins in Nitrosamine Formation in Water,
W81-00922 5A

Laboratory Studies on the Adsorption of Acrylamide Monomer by Sludge, Sediments, Clays, Peat and Synthetic Resins,
W81-00924 5B

RESOURCE ALLOCATION
A Systems Approach to Solving Resource Allocation Problems With Multiple Objectives,
W81-00751 4A

RETURN FLOW
Institutional Constraints on Alternative Water for Energy, a Guidebook for Regional Assessments.
W81-00892 6E

REVERSE OSMOSIS
The Influence of Acceleration and Flow on Concentration Polarization in Reverse Osmosis,
W81-00971 3A

REVIEWS
The Application and Conduct of Ring Tests in Aquatic Toxicology,
W81-00870 7B

Biological Monitoring. Part I-Early Warning Systems,
W81-00880 5A

An Approach to Chemical and Biological River Monitoring Systems,
W81-00952 5C

RIPARIAN LAND
Riparian Ecosystems: A Preliminary Assessment of Their Importance, Status, and Needs.
W81-00929 5C

RIPARIAN PLANTS
Riparian Habitat and Instream Flow Studies, Lower Verde River: Fort McDowell Reservation, Arizona,
W81-00756 2E

Impact of Water Level Changes on Woody Riparian and Wetland Communities, volume VII, Mediterranean Region , Western Arid and Semi-Arid Region,
W81-00765 2I

RIVER FLOW
On the Eleven-Year Solar Cycle and River Flow,
W81-00778 2E

RIVERS
Heterotrophic Bacteria in Two Canadian Rivers-I. Seasonal Variations in the Predominant Bacterial Populations,
W81-00770 5C

Catchment Quality Control,
W81-00854 5G

Quantifying the Eutrophication Process: Difficulties Caused, for Example, by Sediments,
W81-00863 2K

Distribution of Heavy Metals in the Superficial Marine Sediments in the Vicinity of the Rhone Mouths,

SOUTH CAROLINA
Five-Year Water Resources Research and Development Goals, Objectives and Priorities for South Carolina, 1982-1987,
W81-00986 6E

SOUTH-CENTRAL ALASKA
Index of Streamflow and Water-Quality Records to September 30, 1978, south-Central Alaska,
W81-00825 7C

SOUTHEAST ALASKA
Index of Streamflow and Water-Quality Records to September 30, 1978, Southeast Alaska,
W81-00829 7C

SOUTHWEST ALASKA
Index of Streamflow and Water-Quality Records to September 30, 1978, Southwest Alaska,
W81-00827 7C

SPECIATION
Effect of Lead Speciation on Toxicity,
W81-00902 5C

SPECTROMETERS
Determination of Nitrite Ion in Waste and Treated Waters by Resonance Raman Spectrometry,
W81-00927 5A

SPECTROPHOTOMETRY
Semi-Quantitative Determination of Fulvic Acid, Tannin and Lignin in Natural Waters,
W81-00868 5A

Simplified Method for the Determination of Cadmium, Chromium, Copper, Nickel, Lead and Zinc in Sewage Sludge Using Atomic-Absorption Spectrophotometry,
W81-00899 5A

Rapid and Sensitive Spectrophotometric Method for the Determination of Nitrate in Rain Water using 3,4-Xylenol,
W81-00900 5A

SPORT FISHING
Preoperational Fishery Investigations of Twin Lakes, Colorado,
W81-00845 5C

SPRINKLER IRRIGATION
Distribution Patterns of Home Lawn Sprinklers,
W81-00809 3D

STANDARDS
Evaluating the Toxicity of Effluents,
W81-00915 6E

STREAMFLOW
Studies Directed Toward Coupling an Energy Balance Snowmelt Model to a Streamflow Runoff Model,
W81-00755 2A

Riparian Habitat and Instream Flow Studies, Lower Verde River: Fort McDowell Reservation, Arizona,
W81-00756 2E

Surface-Water Availability, Greene County, Alabama,
W81-00815 7C

Availability of Surface Water in Lowndes County, Alabama,
W81-00817 7C

Surface-Water Availability, Tuscaloosa County, Alabama,
W81-00818 7C

Surface-Water Availability, St. Clair County, Alabama,
W81-00819 7C

Index of Streamflow and Water-Quality Records to September 30, 1978, Arctic Slope Alaska,
W81-00824 7C

Index of Streamflow and Water-Quality Records to September 30, 1978, south-Central Alaska,
W81-00825 7C

Index of Streamflow and Water-Quality Records to September 30, 1978, Yukon Basin, Alaska,
W81-00826 7C

Index of Streamflow and Water-Quality Records to September 30, 1978, Southwest Alaska,
W81-00827 7C

Index of Streamflow and Water-Quality Records to September 30, 1978, Northwest Alaska,
W81-00828 7C

Index of Streamflow and Water-Quality Records to September 30, 1978, Southeast Alaska,
W81-00829 7C

STREPTOCOCCUS
Microbiological Evaluation of Coastal Waters Quality in the Tyrrhenian Sea,
W81-00887 5B

SUB-ARCTIC
Microbial Dynamics of Two Sub-Arctic Canadian Rivers,
W81-00956 5C

SUBURBAN AREAS
Rotating Disc Sewage Treatment System for Suburban Developments and High-Density Resorts of Hawaii,
W81-00801 5D

SUCCESSION
The Influence of Eutrophication on Deep Lake Benthic Invertebrate Communities,
W81-00858 5C

SUGARCANE
Recycling of Sewage Effluent by Sugarcane Irrigation: A Dilution Study, October 1976 to October 1978, Phase II-A,
W81-00981 3C

SULFUR BACTERIA
Occurrence of Sulphate Reducing Bacteria in the Human Intestinal Flora and in the Aquatic Environment,
W81-00793 5B

SULFUR COMPOUNDS
The Analysis and Fate of Odorous Sulfur Compounds in Wastewaters,
W81-00776 7B

SURFACE-GROUNDWATER RELATIONSHIPS
High Water Levels in Ground-Water Dominant Lakes--A Case Study from Northwestern Wisconsin,
W81-00810 2A

SURFACE RUNOFF
Rain Water Leachates of Heavy Metals in Road Surface Sediments,
W81-00950 5B

SURFACE WATER AVAILABILITY
Surface-Water Availability, Greene County, Alabama,
W81-00815 7C

Surface-Water Availability, Tuscaloosa County, Alabama,
W81-00818 7C

Surface-Water Availability, St. Clair County, Alabama,
W81-00819 7C

SURFACE WATERS
Geology and Water Availability of Cullman County, Alabama,
W81-00816 7C

Availability of Surface Water in Lowndes County, Alabama,
W81-00817 7C

Water Availability of Blount County, Alabama,
W81-00820 7C

Water Availability, Shelby County, Alabama,
W81-00821 7C

Water Availability in Chilton County, Alabama,
W81-00822 7C

Water Resources Data for Wyoming, Water Year 1979--Volume 1. Missouri River Basin,
W81-00833 7C

Water Resources Data for Idaho, Water Year 1979--Volume 1. Great Basin and Snake River Basin above King Hill.
W81-00834 7C

Water Resources Data for Idaho, Water Year 1979--Volume 2. Upper Columbia River Basin and Snake River Basin below King Hill.
W81-00835 7C

Colour and Turbidity Removal With Reusable Magnetic Particles-I. Use of Magnetic Cation Exchange Resins to Introduce Aluminium Ions,
W81-00882 5F

SURFACTANTS
Problems of Storage of Various Substances Found in the Interstitial Waters of the Surface Sediments of the French Continental Shelf,
W81-00894 5B

Determination of Polyoxyethylene Alkyl Ether Non-Ionic Surfactants in Waters at Trace Levels as Potassium Picrate Active Substances,
W81-00898 5A

Ozone-Induced Biodegradability of a Non-Ionic Surfactant,
W81-00940 5B

Bioaccumulation Profiles of 35S-Labelled Sodium Alkylpoly(Oxyethylene) Sulfates in 35 Carp (Cyprinus Carpio),
W81-00948 5C

SUSPENDED SOLIDS
Investigation to Replace the Conventional Sedimentation Tank by a Microstrainer in the Rotating Disc System,
W81-00797 5D

Performance of Aerobic Digestion at Different Sludge Solid Levels and Operation Patterns,
W81-00865 5D

Treatment of a Filamentous Industrial Waste in a Municipal Step Aeration Plant,
W81-00914 5D

SWAMPS
Contribution of Wooded Swamps and Bottomland Forests to Estuarine Productivity,
W81-00993 6G

SWIMMING POOLS
Evaluation of a Portable Bare-Electrode Amperometric Analyzer for Determining Free Chlorine in Potable and Swimming-Pool Waters,
W81-00945 5A

TERTIARY TREATMENT
An Evaluation of Pretreated Natural Zeolites for Ammonium Removal,
W81-00790 5D

Controlling Organic Compounds in Water - by Treatment,
W81-00908 5D

TESTING PROCEDURES
A Pressurized Proportional Diluter for Aquatic Toxicological Studies,
W81-00795 5C

The Application and Conduct of Ring Tests in Aquatic Toxicology,
W81-00870 7B

Determination of Polyoxyethylene Alkyl Ether Non-Ionic Surfactants in Waters at Trace Levels as Potassium Picrate Active Substances,
W81-00898 5A

TEXTILES
Full-Scale Physical-Chemical-Biological Treatment of Textile Wastewaters,
W81-00873 5D

THEORETICAL ANALYSIS
Preliminary Studies on Combined or Separate Treatment (As Experienced With Effluents From Industries Processing Wood),
W81-00878 5D

THERMAL STATIFICATION
Effects of Pumpback Storage on Zooplankton Populations,
W81-00848 5C

THERMAL STRATIFICATION
The Impact of Pumped Storage Operation on the Vertical Temperature Structure in a Deep Lake: A Mathematical Model,
W81-00849 8B

Combined Use of Physical and Mathematical Models in Evaluating the Effects of Pumped Storage Operation on the Thermal Structure of a Reservoir,
W81-00850 8B

Effects of Vertical Scale Distortion on the Performance of Thermal-Hydraulic Models of Pumped Storage Systems,
W81-00851 8B

THERMAL WATER
Dissolved Air Flotation in Hot Water,
W81-00926 5D

THERMAL WATERS
Acute Toxicity and Behavioral Responses of Coho Salmon (Oncorhynchus Kisutch) and Shiner Perch (Cymatogaster Aggregata) to Chlorine in Heated Sea-Water.
W81-00786 5C

TIME SERIES ANALYSIS
On the Eleven-Year Solar Cycle and River Flow,
W81-00778 2E

TOTAL ORGANIC CARBON
Effluent Quality Variation from Multicomponent Substrates in the Activated Sludge Process,
W81-00962 5D

TOXCITY
A Pressurized Proportional Diluter for Aquatic Toxicological Studies,
W81-00795 5C

TOXICITY
The Application and Conduct of Ring Tests in Aquatic Toxicology,
W81-00870 7B

Combined Effects of Dodecyl Benzene Sulfonate and Low Salinities on Tisbe Bulbisetosa (Copepoda: Harpacticoida),
W81-00889 5C

Effect of Lead Speciation on Toxicity,
W81-00902 5C

Paraquat Toxicity to Louisiana Crayfish (Procambarus ClarkII),
W81-00903 5C

An Apparatus for the Preparation of Varying Concentrations of Chemicals for Toxicity Tests with Aquatic Organisms,
W81-00919 5C

Bioaccumulation Profiles of 35S-Labelled Sodium Alkylpoly(Oxyethylene) Sulfates in 35 Carp (Cyprinus Carpio),
W81-00948 5C

Influence of Water Hardness on Cadmium Toxicity to Salmo Gairdneri Rich,
W81-00949 5C

Avoidance Response of Rainbow Trout (Salmo Gairdneri) to Single-Dose Chlorination in a Power Plant Discharge Canal,
W81-00957 5C

Long-Term Effects of PCB (Clophen A50) on Growth, Reproduction and Swimming Performance in the Minnow, Phoxinus Phoxinus,
W81-00958 5C

TOXINS
Waste Water From a Chemical-Pharmaceutical Works,
W81-00876 5D

Evaluating the Toxicity of Effluents,
W81-00915 6E

Implementing Pretreatment Requirements in the United States: A Study of Four Public Agencies Treating Domestic and Industrial Wastewater,
W81-00916 6E

TRACE ELEMENTS
Influence of Fulvic Acid on the Removal of Trace Concentrations of Cadmium(II), Copper(II), and Zinc(II) from Water by Alum Coagulation,
W81-00807 5D

TRACERS
A Convenient Parameter for Tracing Leachate from Sanitary Landfills,
W81-00942 5A

TRACKING TECHNIQUES
Tracking Movement and Identification of In-Stream Flow Needs of Brown Trout (Salmo trutta) by Use of Radio-Isotopes,
W81-00753 7B

TREATMENT FACILITIES
Standing Proud. Consistency Spells Success at Salt Creek,
W81-00799 5D

TRIHALOMETHANES
Prechlorination Treatment of Water to Reduce Chloroform Levels,
W81-00921 5F

TROUT
Predictions of Effects of Pumped Storage Hydroelectric Operations on Trout Habitat in Jocassee Reservoir, South Carolina,
W81-00841 5C

TUFFACEOUS ROCKS
The Effect of Dissolution of Volcanic Glass on the Water Chemistry in a Tuffaceous Aquifer, Rainier Mesa, Nevada,
W81-00831 2K

TURBIDITY
Colour and Turbidity Removal With Reusable Magnetic Particles-I. Use of Magnetic Cation Exchange Resins to Introduce Aluminium Ions,
W81-00882 5F

TWIN LAKES (CO)
Studies of the Effects of Operating the Mt. Elbert Pumped Storage Powerplant,
W81-00844 5C

Preoperational Fishery Investigations of Twin Lakes, Colorado,
W81-00845 5C

UPPER COLUMBIA RIVER BASIN (ID)
Water Resources Data for Idaho, Water Year 1979--Volume 2. Upper Columbia River Basin and Snake River Basin below King Hill.
W81-00835 7C

URBANIZATION
Expanded Flood Plain Information Study Willow, Alaska.
W81-00757 4A

VEGETATION
Effects of Changes in Surface Water Regime and/or Land Use on the Vertical Distribution of Water Available for Wetland Vegetation, Part I, Dynamic Model of the Zone of Aeration,
W81-00968 4A

VERMONT
River Recreation Use and Analysis of Carrying Capacity,
W81-00972 6B

VERTICAL MIGRATION
Zooplankton Grazing as a Control Mechanism in Algal Blooms. A Method for the Study of the Effect of Algal Toxins on Zooplankton Vertical Migration,
W81-00804 7B

VIRUSES
Evaluation of Procedures for Recovery of Viruses from Water. I. Concentration Systems,
W81-00766 5F

Interaction of Bacteriophage R17 and Reovirus Type III with the Clay Mineral Allophane,
W81-00781 5G

Processes Controlling Virus Inactivation in Coastal Waters,
W81-00788 5E

Microbiological Evaluation of Coastal Waters Quality in the Tyrrhenian Sea,
W81-00887 5B

An Epidemiologic Study of the Relationship between Hepatitis A and Water Supply Characteristics and Treatment,
W81-00897 5F

Virus Interactions with Soil Components: Measurements and Use for Predicting Movement During Land Application of Municipal Wastewater,
W81-00930 5B

Type and Strain Dependence of Enterovirus Adsorption to Activated Sludge, Soils and Estuarine Sediments,
W81-00939 5D

The Effectiveness of Chlorine Residuals in Inactivation of Bacteria and Viruses Introduced by Post-Treatment Contamination,
W81-00960 5F

VIRUSES, *RIVERS
Evaluation of Procedures for Recovery of Viruses From Water-II. Detection Systems,
W81-00767 5A

VOLCANIC GLASS
The Effect of Dissolution of Volcanic Glass on the Water Chemistry in a Tuffaceous Aquifer, Rainier Mesa, Nevada,
W81-00831 2K

VOLUMETRIC ANALYSIS
Some Problems in the Determination of Total Residual 'Chlorine' in Chlorinated Sea-Water,
W81-00917 5A

WASTE DILUTION
A Convenient Parameter for Tracing Leachate from Sanitary Landfills,
W81-00942 5A

WASTE DISPOSAL
A Few Thoughts on Waste,
W81-00812 5D

A Model Provision for Non-Degradation of Groundwater: What is a Detrimental Effect and Where is it Measured,
W81-00935 5A

Leachate Collection Using the Ground-Water Flow System: A Landfill Case History in Central Pennsylvania,
W81-00965 5E

WASTE STORAGE
Leachate Collection Using the Ground-Water Flow System: A Landfill Case History in Central Pennsylvania,
W81-00965 5E

WASTE TREATMENT
A Preliminary Site Evaluation Method for Treatment of Municipal Wastewater by Spray Irrigation of Forest Land,
W81-00932 3C

Biological Treatment of a Coal Gasification Process Wastewater,
W81-00944 5D

Treatment of Mililani STP Effluent for Drip Irrigation of Sugarcane,
W81-00984 5D

WASTE WATER DISPOSAL
Utilisation, Treatment and Disposal of Distillery Wastewater,
W81-00796 5D

Construction Aspects of Outfall Design for Greater Athens,
W81-00885 5E

Sewage Treatment and Effluent Disposal Options Appropriate to Mediterranean Coastal Developments as Studied for Greater Athens,
W81-00886 5E

Virus Interactions with Soil Components: Measurements and Use for Predicting Movement During Land Application of Municipal Wastewater,
W81-00930 5B

WASTE WATER (POLLUTION)
A Model Provision for Non-Degradation of Groundwater: What is a Detrimental Effect and Where is it Measured,
W81-00935 5A

WASTE WATER TREATMENT
Optimal Periodic Control of Activated Sludge Processes: II. Comparison With Conventional Control for Structured Sludge Kinetics,
W81-00769 5D

The Treatment of Malt Whiskey Distillery Waste Using the Fungus Geotrichum Candidum,
W81-00772 5D

The Analysis and Fate of Odorous Sulfur Compounds in Wastewaters,
W81-00776 7B

Estimation of Nitrifying Biomass and Kinetics in Wastewater,
W81-00780 5D

Significance of COD, BOD and TOC Correlations in Kinetic Models of Biological Oxidation,
W81-00784 5D

An Evaluation of Pretreated Natural Zeolites for Ammonium Removal,
W81-00790 5D

Some Dimensionless Parameters of Impeller Power in Coagulation-Flocculation Processes,
W81-00791 5D

Utilisation, Treatment and Disposal of Distillery Wastewater,
W81-00796 5D

Investigation to Replace the Conventional Sedimentation Tank by a Microstrainer in the Rotating Disc System,
W81-00797 5D

Standing Proud. Consistency Spells Success at Salt Creek,
W81-00799 5D

Studies on the Use of Inorganic Gels in the Removal of Heavy Metals,
W81-00872 5D

Preliminary Studies on Combined or Separate Treatment (As Experienced With Effluents From Industries Processing Wood),
W81-00878 5D

Trends in Coastal Waste Treatment,
W81-00891 5D

Controlling Organic Compounds in Water - by Treatment,
W81-00908 5D

Implementing Pretreatment Requirements in the United States: A Study of Four Public Agencies Treating Domestic and Industrial Wastewater,
W81-00916 6E

Dissolved Air Flotation in Hot Water,
W81-00926 5D

Ozone-Induced Biodegradability of a Non-Ionic Surfactant,
W81-00940 5B

Technical, Economic and Environmental Aspects of Wet and Dry Debarking.
W81-00954 5D

Effluent Quality Variation from Multicomponent Substrates in the Activated Sludge Process,
W81-00962 5D

Iron Removal by Rotating Contact Reactor,
W81-00985 5D

WASTEWATER
A Preliminary Site Evaluation Method for Treatment of Municipal Wastewater by Spray Irrigation of Forest Land,
W81-00932 3C

WATER ALLOCATION (APPLIED)
Optimal Regional Conjunctive Water Management,
W81-00988 6B

WATER ALLOCATION POLICY
Legal, Financial and Economic Analysis of a Water Supply Bank in Idaho,
W81-00977 6E

WATER ANALYSIS
Analyses of Water and Dredged Material from Selected Southern Louisiana Waterways and Selected Areas in the Gulf of Mexico, 1976-78,
W81-00836 5A

Detailed Report on the Use of Enzymatic Cycling for High Specificity and Precision in the Colorimetric Analysis of Ammonia,
W81-00987 5A

WATER CHEMISTRY
The Effect of Dissolution of Volcanic Glass on the Water Chemistry in a Tuffaceous Aquifer, Rainier Mesa, Nevada,

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 14, NUMBER 7
APRIL 1, 1981

W81-01001 -- W81-01203
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $100; Journal and Annual Indexes, $125; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 14, NUMBER 7
APRIL 1, 1981

W81-01001 -- W81-01203

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and monthly updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1B. Aqueous Solutions and Suspensions

CHLORIDE IONS IN AQUEOUS SOLUTIONS,
Bristol Univ. (England). H. H. Wills Physics Lab.
S. Cummings, J. E. Enderby, G. W. Neilson, J. R. Newsome, and R. A. Howe.
Nature, Vol 287, No 5784, p 714-716, October 23, 1980. 1 Fig, 2 Tab, 13 Ref.

Descriptors: *Aqueous solutions, *Chlorides, *Sodium chloride, *Electrolytes, *Calcium chloride, Lithium chloride, Rubidium chloride, Nickel chloride, Barium chloride.

The isotopic substitution method was used to study the geometry of chloride ion coordination (hydration) in aqueous solutions of the following counter-ions: lithium, sodium, rubidium, calcium, nickel, and barium. Salts composed of both C135 and C137 isotopes were dissolved in heavy water and their scattering lengths measured: C135 salts, 1.17 fm; C137 salts, 0.35 fm. Results indicated that chloride ion hydration is essentially independent of both cation and ionic strength with the exception of Ni(++). Therefore, counter-ion influences may be considered second-order, leading to a simplification in the theory of solutions. However, it is possible that highly concentrated solutions of transition metal ions may be exceptions to these findings. (Cassar-FRC)

W81-01031

MODELING THE RUNOFF PROCESS IN URBAN AREAS,
Purdue Univ., Lafayette. School of Civil Engineering.
J. W. Delleur, and S. A. Dendrou.
CRC Critical Reviews in Environmental Control, Vol 10, No 1, p 1-64, July, 1980. 18 Fig, 6 Tab, 204 Ref.

Descriptors: *Urban runoff, *Model studies, *Urban drainage, *Storm runoff, Environmental effects, Rainfall-runoff relationships, Water pollution, Reviews, Evaluation, Distribution patterns, *Urban hydrology, Design storm.

The major works critically reviewed pertain to the large, recent, specialized literature concerned with the study of storm runoff and its environmental effects. The effort is made at producing a synthesis of the state-of-the-art in modeling urban runoff, with emphasis on identifying the limitations, current needs, and trends of future work. After a discussion of precipitation and its abstraction over urban areas, the models of physical processes are presented; those related to the quantity and quality (pollutants) are discussed separately. Also a distinction is made between the lumped parameter models and the distributed parameter models. The most important development in urban hydrology during the last decade has been the development of sophisticated large-scale simulation models of storm drainage systems. Finally the economics of urban storm-drainage systems are addressed and conclusions and future trends are presented.

2C. Snow, Ice, and Frost

RECONNAISSANCE SNOW SURVEY OF THE NATIONAL PETROLEUM RESERVE IN ALASKA, APRIL-MAY 1979,
Geological Survey, Anchorage, AK. Water Resources Div.
W. J. Glude, and C. E. Sloan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-225006, Price codes: A02 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-49, 1980. 13 p, 7 Fig, 1 Tab, 3 Ref.

Descriptors: *Snow surveys, *Evaluation, *Alaska, *Snow management, *Snowfall, Precipitation(Atmospheric), Sampling, Snow cover, Snowmelt, Water equivalent, Snowpacks, Avalanches, Remote sensing, *National Petroleum Reserve in Alaska.

Moderately low snowfall and an early and abrupt spring thaw resulted in removal of most of the snow cover from the National Petroleum Reserve in Alaska (NPRA) before the snow survey of April 30 through May 2, 1979. Logistical problems and lack of snow permitted sampling at only seven sites. The average snow depth (0.263 meter) was approximately 60% of that measured in the 1977 and 1978 surveys. Snow density in 1979 averaged 337 kilograms per cubic meter and water equivalent averaged 0.088 meter. These two values are about 110% and 70%, respectively, of values for those characteristics in 1977-78. The average temperature of -5.2 Celsius at the base of the snowpack was about 6 Celsius higher than in the previous surveys. Extensive recent slab avalanche activity was noted in the Brooks Range. (USGS)
W81-01187

2D. Evaporation and Transpiration

PROGRAMS REVAP AND WEVAP FOR ESTIMATING AREAL EVAPOTRANSPIRATION AND LAKE EVAPORATION FROM CLIMATOLOGICAL OBSERVATIONS,
National Hydrology Research Inst., Ottawa (Ontario).
F. I. Morton, R. Goard, and J. Piwowar.
NHRI paper No 12, 1980. 56 p, 4 Fig, 1 Tab, 5 Ref, 3 App.

Descriptors: *Evapotranspiration, *Lake evaporation, *Climatic data, Data collections, *Computer models, Areal hydrology, Potential, Documentation, Input, Air temperature, Dew point temperature, Sunshine duration, Forecasting.

This report contains the necessary documentation for application of the computer programs REVAP and WEVAP. Estimates of areal evapotranspiration or lake evaporation for periods of 5 days to 1 month are made from routinely published records of air temperature, dew point temperature and sunshine duration. Both models are based on a complementary relationship between areal and potential evapotranspiration. Details of preparation of the input card deck as well as a sample output are discussed. Included in the appendices are the FORTRAN program listing for program REVAP and documentation of the comparable Hewlett-Packard HP-67 hand-held calculator program. (WATDOC)
W81-01017

WATER MOVEMENT THROUGH STANDS OF LODGEPOLE PINE FOREST IN WYOMING,
Wyoming Univ., Laramie. Dept. of Botany.
D. H. Knight, and T. J. Fahey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-152027, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Institute, University of Wyoming Project Completion Report, November, 1980, 75 p, 11 Fig, 9 Tab, 92 Ref. OWRT-B-036-WYO(1), 14-34-0001-7202.

Descriptors: *Transpiration, Water loss, *Lodgepole pine trees, *Forests, *Flow, Forecasting, Soil-water movement, Snowmelt, Phytometers, Rainfall, Model studies, Weather, *Wyoming.

Various aspects of water movement through lodgepole pine forest were studied. The results, presented in 3 separate chapters, can be summarized as follows: (1) stands with very different tree density and biomass may have very similar leaf area indices (6.5 and 6.7) and clear day transpiration rates (3.3 and 3.4 mm day super -1, measured with whole-tree potometers); (2) whole-tree potometers can be used for estimating short-term transpiration when leaf water potential is not limiting leaf conductance; (3) individual tree basal area and maximum observed 24-hr potometer uptake were highly correlated in the stands studied, with the largest trees (20-26 cm dbh) transpiring 40-44 liters on clear days in early summer; (4) on overcast days potometer uptake was reduced by 30-44%; during rainy periods uptake was reduced to nearly zero; (5) predicted outflow, using a computer simulation model developed during this study, appeared to be more sensitive to variation in soil waterholding capacity than to stand leaf area, but the combined effects of forest LAI on water uptake during snowmelt, timing and duration of snowmelt, and soil water drawdown in summer and fall resulted in significant effects on predicted outflow; and (6) overnight frost in the spring reduced leaf conductance the following day, and midday leaf conductance was highly correlated with the mean temperature of subfreezing nights.

2E. Streamflow and Runoff

PREDICTING THE EFFECTS OF STORM SURGES AND ABNORMAL RIVER FLOW ON FLOODING AND WATER MOVEMENT IN MOBILE BAY, ALABAMA,
Alabama Univ., University.
G. C. April, and D. C. Raney.
In: Estuarine and Wetland Processes, P. Hamilton and K. B. MacDonald (Eds.), Plenum Publishing Corp., New York, NY, 1980. p 217-245. 10 Fig, 6 Tab, 9 Ref, 1 Append. OWRT-A-061-ALA(3).

Descriptors: *Model studies, Mathematical models, *Forecasting, *Storm surge, *Flooding, Water spreading, *Alabama, Experimental models, Climatic data, Mathematical studies, Computer models, Numerical analysis, Probability, Statistical methods, Storms, Hurricanes, Tropical cyclones, Storm water, Weather, Floodwater, Flood waves, Bays, *Mobile Bay(AL).

Recent numerical modeling activities of the Mobile Bay system under severe conditions were discussed. Results were presented in terms of changes that occur in water elevation and movement, and, in salinity distribution patterns when the Bay is subjected to river flooding inflows and storm surges. A river flood stage of 7000 cubic meters per second results in water behavior in the northern and central Bay portions that is totally governed by the fresh water inflow. A salinity level of five parts-per thousand (ppt) is restricted to the lower Bay region at a point 15 kilometers from the Main Pass. Usual salinity values under normal conditions in this area range from 15-20 ppt. A critical river flow rate of 8500 cubic meters per second was identified, at or above which saline water intrusion in the lower Bay becomes stabilized at 10 ppt on a line 6 kilometers north of the Main Pass. Conversely, large amounts of saline water enter the Bay under the storm surge conditions studied. Conditions used in the modeling exercise were typical of those caused by Hurricane Camille in 1969. In both cases, the model results were representative of Bay behavior. (Zielinski-IPA)

E. E. Webber, and R. I. Mayo.
Geological Survey Open-File Report 80-16 (WRI), 1980. 7 p, 2 Fig, 1 Tab, 3 Ref.

Descriptors: *Floods, *Ohio, *Rainfall-runoff relationships, *Streams, *Flash floods, Flood damage, Flood peak, Flood frequency, Flood recurrence interval, *Honey Creek tributary(OH), Thornville(OH).

A high-intensity summer rain estimated at 8 inches in 2 hours caused flooding on a small stream near Thornville, Ohio, destroying a culvert and highway fill on State Highway 188. Computation of peak discharges of 3,250 cubic feet per second above and 4,050 cubic feet per second below the culvert indicates a greater than 100-year flood. (USGS)

The most productive aquifers in the Fishkill-Beacon area, Dutchess County, N.Y., are the sand and gravel beds in the northeast corner of the area and along the valleys of Fishkill and Clove Creeks. The average yield of these aquifers to wells is 190 gal/min (gallons per minute). The most productive bedrock aquifer is limestone, which yields an average of about 150 gal/min. Shale and granite each yield an average of less than 35 gal/min. About 4 billion gallons of available ground water is estimated to be in storage in the sand and gravel aquifers in the area. The area withdraws an average of 3.3 Mgal/d (million gallons per day) of water in June, July, and August and 2 Mgal/d during the remainder of the year. (USGS)

DIGITAL-SIMULATION AND PROJECTION OF HEAD CHANGES IN THE POTOMAC-RARITAN-MAGOTHY AQUIFER SYSTEM, COASTAL PLAIN, NEW JERSEY,
Geological Survey, Trenton, NJ. Water Resources Div.
J. E. Luzier.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-115768, Price codes: A05 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-11, May, 1980. 72 p, 32 Fig, 6 Tab, 33 Ref.

Descriptors: *Groundwater resources, *Model studies, *Hydrogeology, *Aquifer characteristics, *New Jersey, Computer models, Water supply, Pumping, Drawdown, Encroachment, Saline water, Water yield, Potentiometric level, Groundwater recharge, Hydrologic properties, Leakage, Transmissivity, Groundwater movement, Simulation analysis, Evaluation, Head loss, *Coastal Plain(NJ), *Potomac-Raritan-Magothy aquifer system.

A digital model was used to simulate the response of the Potomac-Raritan-Magothy aquifer system to pumping stresses during the 18-year period, 1956-73. The model was used to compute projected potentiometric heads and trends to the year 2000. Three sets of conditions were simulated: (1) no increase in groundwater extractions; (2) continued growth in groundwater extractions at the rate of 3% annually; and (3) continued growth in groundwater extractions at the rate of 3% annually, in conjunction with the activation of a freshwater head barrier in the fresh-salty water transition zone. Under the first set of conditions, further head reduction would cease over very large regions within two years. Under the second set of conditions, the broad cone of depression would broaden and deepen. Heads would range from 60 to 160 feet below mean sea level with declines after 1973 approaching 90 feet in some areas. The resultant steeper hydraulic gradients would accelerate the movement of salty ground water toward the pumping centers. If a freshwater head barrier were constructed across a 35-mile stretch in Gloucester, Camden, and Burlinton Counties, the total rates of injection needed would range from about 56 cubic feet per second in year 1984 to about 95 cubic feet per second in year 2000. Barrier recharge rates would be equivalent to about 20% of the ground water pumped. (USGS)

DEVELOPMENT AND USE OF A MATHEMATICAL MODEL OF THE SAN BERNARDINO VALLEY GROUND-WATER BASIN, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
W. F. Hardt, and C. B. Hutchinson.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $14.50 in paper copy, $4.00 in microfiche. Geological Survey Open-File Report 80-576 (WRI), September, 1980. 80 p, 19 Fig, 1 Plate, 8 Tab, 37 Ref.

Descriptors: *Model studies, *Mathematical models, *Aquifer characteristics, *Groundwater basins, *California, Hydrologic data, Finite element analysis, Hydrogeology, Groundwater movement, Artesian wells, Pumping, Drawdown, Artificial recharge, Natural recharge, Water level fluctuations, Potentiometric level, Transmissivity, Storage coefficient, Maps, *San Bernardino Valley(CA), Projections.

Part of the San Bernardino urbanized area in California overlies formerly swampy lands with a history of flowing wells. This area, upgradient from and adjacent to the San Jacinto fault, contains a zone in an alluvial ground-water basin that is under artesian pressure. Since 1945, withdrawals have exceeded recharge and caused head declines of more than 100 feet. Artificial recharge of imported water in the upgradient areas may cause groundwater levels to rise, which could cause abandoned but unplugged wells to resume flowing. If so, structures could be damaged. A two-layer Galerkin finite-element digital model was used for predicting the rate and extent of the rise in water levels from 1975 to 2000. Six hydrologic conditions were modeled for the basin. Artificial recharge of one-half entitlement and full entitlement from the California Aqueduct were each coupled with low, average, and high natural recharge to the basin. According to model predictions, the greatest water level rises will be along the San Bernardino front. This area encompasses the artificial recharge sites and also has a thick section of unsaturated sediments for storing ground water. The formerly swampy lands between Warm Creek and the Santa Ana River adjacent to the San Jacinto fault have little additional storage capacity, and water levels could rise to the land surface as early as 1983 under maximum recharge conditions and 1970-74 average pumping conditions. If pumping rates are reduced in the Warm Creek area, water levels may rise to land surface prior to the dates predicted by the model, regardless of the artificial-recharge program. (USGS)
W81-01186

SIMULATED EFFECTS OF A PROPOSED WELL FIELD ON THE GROUNDWATER SYSTEM IN THE SALT RIVER INDIAN RESERVATION, MARICOPA COUNTY, ARIZONA,
Geological Survey, Tucson, AZ. Water Resources Div.
P. P. Ross.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $3.25 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-503-W, April, 1980. 22 p, 7 Fig, 12 Ref.

Descriptors: *Model studies, *Simulation analysis, *Groundwater, *Aquifer characteristics, *Arizona, Hydrogeology, Irrigation wells, Water levels, Withdrawal, Pumping, Drawdown, Overdraft, Recharge, Digital computers, Computer models, *Maricopa County(AZ), Salt River Indian Reservation, Well field.

A finite-difference digital model was developed to simulate the effects of a proposed well field on the water levels in existing wells in the Salt River Indian Reservation, which is in the southeastern part of Paradise Valley in central Arizona. The

model area includes about 600 square miles in Paradise Valley and the adjoining Salt River Valley. In 1975 about 37,500 acre-feet of ground water was withdrawn for irrigation in the Salt River Indian Reservation. The proposed well field would withdraw as much as 45,000 acre-feet per year of additional irrigation water north of the Arizona Canal. The model was calibrated by using measured water-level declines for 1923-76 and simulated declines for 1946-75. The calibrated model was then used to predict water-level declines, based on projected amounts of pumpage, after 20 years of pumping. The rate of water-level decline would be an additional 2 to 6 feet per year in existing wells after 20 years of pumping in the proposed well field. The model was more sensitive to changes in pumpage distribution and in pumpage and recharge amounts than to changes in transmissivity and specific yield. (USGS)

2G. Water In Soils

THIRD-ORDER INTEGRAL RELATION BETWEEN SORPTIVITY AND SOIL WATER DIFFUSIVITY USING BRUTSAERT'S TECHNIQUE,
Griffith Univ., Nathan (Australia). School of Australian Environmental Studies.
J-Y. Parlange, R. D. Braddock, and I. Lisle.
Soil Science Society of America Journal, Vol 44, No 5, p 889-891, September-October, 1980. 1 Tab, 15 Ref.

Descriptors: *Diffusivity, *Soil water, *Sorption, Soil physics, Brutsaert's technique, Equations.

An improvement in the understanding of mathematical relationships between sorptivity and soil-water diffusivity is presented. This result can be used to predict soil-water diffusivity from sorptivity measurements in a wide range of soil conditions. Precision of this method is discussed for two general classes of soil-water diffusivities. (Cassar-FRC)

COMPARATIVE RESISTANCE OF THE SOIL AND THE PLANT TO WATER TRANSPORT,
Illinois Univ. at Urbana-Champaign. Dept. of Botany.
W. E. Blizzard, and J. S. Boyer.
Plant Physiology, Vol 66, No 5, p 809-814, November, 1980. 6 Fig, 2 Tab, 30 Ref.

Descriptors: *Plant physiology, *Water balance, Soil water, *Soil water movement, *Soil-water-plant relationships, *Flow resistance, Evapotranspiration, Groundwater potential, Mass transfer, Mathematical studies.

Resistance to water transport was compared in soils and plants. Direct measurements were made of soil, root, and leaf water potentials and the flux of water through the soil-plant system to the evaporation sites in the leaf. In measurements made in soybeans, with water being transported at a steady rate, water potential differences between root and leaf over the range of soil water potentials from -0.2 to -11 bars. As the water in the soil was being used up, water flow through both the soil and the plant decreased to one-tenth the maximum rate. However, both the soil and the plant resistance remained at a higher level than soil resistance to water transport over the entire range of soil water availability studied. It is suggested that, at least in young plants, the plant resistance is the largest resistance factor in the soil-plant system over the range of soil water likely to be encountered. Therefore, alterations in water transport characteristics of the plant could be a major factor on leaf water status and on the growth of plants in both moist and dry soils. (Baker-FRC)

A CLOSED-FORM EQUATION FOR PREDICTING THE HYDRAULIC CONDUCTIVITY OF UNSATURATED SOILS,
Science and Education Administration, Riverside, CA. Salinity Lab.
M. T. van Genuchten.
Soil Science Society of America Journal, Vol 44, No 5, p 892-898, September/October, 1980. 9 Fig, 1 Tab, 21 Ref.

Descriptors: *Hydraulic conductivity, *Soil water movement, *Diffusivity, Unsaturated flow, Mualem method, Burdine method, Mathematical models.

Hydraulic conductivity results obtained with the closed-form analytical expressions based on the Mualem model were compared with observed hydraulic conductivity data for five soils with widely varying hydraulic properties. In 4 of 5 cases, the hydraulic conductivity was predicted well. A reasonable description of the soil-water retention curve at low water contents was found to be important for accurately predicting the unsaturated hydraulic conductivity. (Cassar-FRC)
W81-01087

EFFECTS OF BICARBONATE ON SODIUM HAZARD OF IRRIGATION WATER: ALTERNATIVE FORMULATION,
Texas A and M Univ. Research Center, El Paso.
S. Miyamoto.
Soil Science Society of America Journal, Vol 44, No 5, p 1079-1084, September/October, 1980. 4 Tab, 21 Ref.

Descriptors: *Sodium, *Irrigation water, *Bicarbonates, *Drainage water, Effects, Sodium bicarbonate, Calcium, Magnesium, Equations, Saturation index.

An alternative formulation for predicting effects of bicarbonates on sodicity of irrigation waters, drainage water, and soils is presented. A comparison of results using this method with published data shows that the conventional equation using saturation index overestimates sodicity of water having a high ratio of calcium to bicarbonate and underestimates otherwise. If the pH of a drainage water is known, a second power polynomial approximation can be used to predict sodicity. Although the proposed methods are more complex than the conventional method, programmable calculators or minicomputers can be used satisfactorily. (Cassar-FRC)
W81-01089

SATURATED-UNSATURATED FLOW IN RADIAL DIRECTIONS GENERATED BY AN INJECTION WELL,
Princeton Univ., NJ. Dept. of Civil Engineering.
D. K. Babu.
Soil Science Society of America Journal, Vol 44, No 5, p 915-921, September/October, 1980. 6 Fig, 25 Ref.

Descriptors: *Injection wells, *Soil water movement, Saturated flow, Leaching, Infiltration, Equations.

The techniques and formulas derived in this paper can produce reliable estimates of flow quantities in solute transport and salt leaching phenomena. The saturated-unsaturated flow conditions are produced by a vertically-placed line source that injects water into the soil at a constant rate. Flow takes place only in horizontal radial directions. Singular perturbation methods are applied to derive a solution, uniformly valid at all points of time and space, as a power series in the perturbation parameter. Location of the wetting front and the transition face between saturated and unsaturated flow regimes may be determined by formulas. (Cassar-FRC)

COMPARISON OF ONE-STEP OUTFLOW LABORATORY METHOD TO AN IN SITU METHOD FOR MEASURING HYDRAULIC CONDUCTIVITY,
Wisconsin Univ., Madison. Dept. of Soil Science.
D. B. Jaynes, and E. J. Tyler.
Soil Science Society of America Journal, Vol 44, No 5, p 903-907, September/October, 1980. 4 Fig, 1 Tab, 33 Ref.

Descriptors: *Hydraulic conductivity, *Passioura method, *Soil water movement, Diffusivity, Unsaturated flow, Laboratory tests, Percolation.

The Passioura modification of the one-step outflow method for determining unsaturated hydraulic conductivity is compared with data obtained from the in situ crust method. Results, using three soils, agreed well. Discrepancies between hydraulic conductivity values obtained were attributed to hysteresis effects. With modifications, this inexpensive, rapid laboratory method can be used to measure hydraulic conductivity in constantly wet soils such as on-site liquid waste disposal systems. (Cassar-FRC)

2H. Lakes

LAKES OF OREGON: VOLUME 6. DOUGLAS COUNTY,
Geological Survey, Portland, OR. Water Resources Div.
J. F. Rinella.
Geological Survey Open-File Report, 1979. 123 p, 4 Fig, 2 Tab, 20 Ref.

Descriptors: *Lakes, *Oregon, *Investigations, *Hydrologic data, *Water quality, Drainage area, Elevation, Volume, Lake morphology, Lake morphometry, Thermal stratification, Inflow, Discharge(Water), Chemical analysis, Water utilization, Areal photography, Bathymetry, Mapping, *Douglas County lakes(OR).

An inventory of lakes and reservoirs in Oregon is useful in evaluating the surface-water supply of the State and in providing answers to questions about Oregon's lakes. Much of the information on lakes and reservoirs previously collected by Federal and State agencies has never been published. Those data were compiled and used as a basis for collecting additional information. This report provides information for use by city, county, and State planning groups in planning interpretative studies. The information also will be useful to sportsmen, tourists, and others interested in preserving the recreational value of Oregon's lakes. In addition to office compilation of existing data, each lake was visited. Most visits were made in summer or early fall when lakes were most accessible and when

water temperature and biological activity were near maximum. There are no commonly accepted criteria for distinguishing among lakes, ponds, pools, sloughs, and other water bodies. In general, any lake or impoundment with a surface area greater than 5 acres is included in this inventory, but a few smaller lakes are also included. Natural ephemeral lakes are not included nor are privately owned lakes or impoundments. (USGS)
W81-01043

A SALT BALANCE SIMULATION MODEL OF LAKE NASSER,
Academy of Scientific Research and Technology, Cairo (Egypt).
G. Guariso, D. Whittington, M. E. Abdel-Samie, and C. Kramer.
Water Supply and Management, Vol 4, No 112, p 73-80, 1980. 1 Fig, 3 Tab, 23 Ref.

Descriptors: *Lake Nasser, *Salinity, *Salt balance, *Irrigation water, *Artificial lakes, *Model studies, Reservoir, Lakes, Aswan High Dam, Nile River, Impounded waters, Discharge(Water), *Egypt.

Careful examinations of salt concentrations in Lake Nasser are necessary because salinization and water-logging presently exist throughout much of Egyptian agricultural land. A mass balance equation and a salt balance simulation model were used to calculate total dissolved solids in water discharged from the Aswan high dam for the years 1880-1976. Salinity trends and evaluation of the dam's impact cannot be predicted using data from a 10 to 15 year period. Rather, salinity is dependent on the pattern of water flowing into the Lake. Salinity is higher during years of high flood because evaporation losses are greater when the reservoir is full. Volumes of the lake water in any given month were calculated using inflow, seepage losses, evaporation losses and discharge from the dam. The salt balance simulation model was used to prepare a table listing water inflow and outflow, salt inflow and outflow, seepage and evaporation losses, total water volume as of July 31, and salt concentration for the years 1890-1919. (Cassar-FRC)
W81-01073

HYPOLIMNETIC METABOLISM IN THREE CAPE COD LAKES,
Connecticut Univ., Storrs. Biological Sciences Group.
P. H. Rich.
American Midland Naturalist, Vol 104, No 1, p 102-109, July, 1980. 1 Fig, 2 Tab, 15 Ref.

Descriptors: *Photosynthesis, *Hypolimnion, *Light penetration, *Oxidation, Stratification, Lakes, Oxygen, Respiration, Carbon, Eutrophication, Oligotrophy, Mesotrophy, Limnology, Oxidation-reduction potential, Water properties, *Cape Cod.

The oxidation potential of hypolimnetic organic matter and the carbon dioxide levels were determined in three closed-basin kettle lakes of similar morphometry on Cape Cod. Areal hypolimnetic measurements of O2 and dissolved inorganic carbon (DIC) were taken under stratified conditions in the summer of 1976. Lakes Gull and Hathaway showed O2 deficits characteristic of oligotrophic ponds, while Mares Pond was distinctly mesotrophic. DIC increments gave borderline eutrophic results for Mares Pond. Both O2 uptake and DIC release were observed to be inversely correlated to the amount of light penetrating to the hypolimnion. Ratios of DIC released to O2 taken up (by respiration) in the hypolimnia of the three lakes ranged from 1.4 to 3.4. This ratio was also directly correlated with the amount of light reaching the hypolimnion, suggesting that O2 uptake is suppressed more by underwater light than it is by DIC release. It was also hypothesized that lakes may increase their stock of alternate electron acceptors by contributing electrons to anaerobic photosynthesis at or below the depth of light compensation. (Geiger-FRC)

SEDIMENT TRANSPORT OF STREAMS TRIBUTARY TO SAN FRANCISCO, SAN PABLO, AND SUISUN BAYS, CALIFORNIA, 1909-66,
Geological Survey, Menlo Park, CA. Water Resources Div.
G. Porterfield.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-118622, Price codes: A06 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-64, August, 1980. 92 p, 19 Fig, 31 Tab, 33 Ref.

Descriptors: *Sediment transport, *Streamflow, *Bays, *California, Land use, Runoff, Sediment discharge, Sedimentation rates, Sediment load, Particle size, History, Water quality, Water resources development, Hydrologic data, San Francisco Bay(CA), San Pablo Bay(CA), Suisun Bay(CA).

A review of historical sedimentation data is presented, results of sediment-data collection for water years 1957-59 are summarized, and long-term sediment-discharge estimates from a preliminary report are updated. Comparison of results based on 3 years of data to those for the 10 water years, 1957-66, provides an indication of the adequacy of the data obtained during the short period to define the long-term relation between sediment transport and streamflow. During 1909-66, sediment was transported to the entire San Francisco Bay system at an average rate of 8.6 million cubic yards per year. The Sacramento and San Joaquin River basins provided about 83% of the sediment inflow to the system annually during 1957-66 and 86% during 1909-66. About 98% of this inflow was measured or estimated at sediment measuring sites. Measured sediment inflow directly to the bays comprised only about 40% of the total discharged by basins directly tributary to the bays. About 90% of the total sediment discharge to the delta and the bays in the San Francisco Bay system thus was determined on the basis of systematic measurements. (USGS)
W81-01034

SEDIMENT TRANSPORT IN THE SNAKE AND CLEARWATER RIVERS IN THE VICINITY OF LEWISTON, IDAHO,
Geological Survey, Boise, ID. Water Resources Div.
M. L. Jones, and H. R. Seitz.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $24.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-690 (WRI), August, 1980. 179 p, 23 Fig, 18 Tab, 18 Ref.

Descriptors: *Sediment transport, *Baseline studies, *Pre-impoundment, *Post-impoundment, *Idaho, Hydrologic data, Suspended load, Bed load, Streamflow, Channel morphology, Data collections, Sedimentation, *Snake River(ID), Clearwater River(ID).

During the period 1972-79, bedload in the Clearwater River in the vicinity of Lewiston, Idaho, ranged from about 50,000 tons per year in 1972 and 1974 to about 1,000 tons per year in the drought years of 1973 and 1977. Suspended-sediment load at the same location ranged from about 1,000,000 tons per year to about 50,000 tons per year for the same respective years. In the Snake River, bedload ranged from about 200,000 tons per year for 1972 and 1974 to about 10,000 tons per year in 1973; bedload was too minimal for determination in 1977. Suspended-sediment load ranged from about 5,000,000 tons per year in 1974 to about 50,000 tons in 1977. Bedload thus ranged from about 2 to 10% of suspended load and averaged about 5%. For either river, bedload particle size was bimodal. Modes were in the medium- to course-sand range and in the very coarse-gravel range. Suspended-sediment particle size was generally finer than sand. Thus, particles constituting bedload were distinctively larger in size than particles constituting suspended load. (USGS)

K. Mopper, R. Dawson, G. Liebezeit, and V. Ittekkot.
Marine Chemistry, Vol 10, No 1, p 55-66, October, 1980. 4 Fig, 2 Tab, 32 Ref.

Descriptors: *Carbohydrates, *Sampling, *Natural streams, Chromatography, Separation techniques, Sea water, Groundwater, Estuaries, Laboratory tests, Desalination, Chemical reactions, Carbon cycle, Photosynthesis, Aquatic environments.

A variety of water and sediment pore water samples from a wide range of environments were collected and analyzed for monosaccharides by liquid chromatography. Twelve sugars were positively identified from desalted extracts of the water samples. The dominant monosaccharides in all samples were glucose and fructose. Over 150 seawater and sediment pore water samples had levels of fructose which were highly correlated with their levels of glucose. The epimerization reaction of glucose to fructose was examined in laboratory kinetic tests using sterilized samples of natural seawater kept in the dark. The forward rate constant was determined at 2 and 25 degrees, as was the time required for each system to attain equilibrium. The actual ratio of fructose to glucose in natural water samples was found to be independent of the total monosaccharide levels, and was usually in the range of 1.0-1.4/1. Factors which may have been responsible for the discrepancy in the predicted and observed ratios such as biological sources of fructose, preferential utilization of glucose or fructose, and preferential formation of fructose-transition metal ion associations were considered. IN-SITU REGISTRATION OF OXYGEN UTILIZATION AT SEDIMENT-WATER INTERFACES,
Kiel Univ. (Germany, F.R.). Inst. fuer Meereskunde.
H. P. Hansen, K. Grasshoff, and J. Petersen.
Marine Chemistry, Vol 10, No 1, p 47-54, October, 1980. 6 Fig, 7 Ref.

Descriptors: *Sediment-water interfaces, *Oxygen demand, *Measurement, Equipment, Sands, Mud, Water temperature, Water pressure, Kiel Bight.

Oxygen utilization of the sediments in the Kiel Bight was measured using a polyacrylic dome anchored over natural sediments. Vertical convection was produced by means of a small pump, and

oxygen partial pressure and temperature were measured at 20 minute intervals by an automatic data system. After recovery, the data stored in digitized form on magnetic tape was read by a microprocessor, interpreted, listed, and plotted against time. Sandy sediments showed a decrease in oxygen saturation which was nearly independent of temperature. Muddy sediments at low temperatures showed a similarly slow decrease, but a considerably increased oxygen utilization with increasing temperatures. Sediment type and temperature were the dominating control parameters for relative oxygen utilization, and the absolute oxygen consumption of a given sediment type at a given temperature was linear function of oxygen concentration. 3. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

DEVELOPMENT OF NOVEL POROUS SUBSTRATES FOR ULTRAFILTRATION, DESALINATION, AND WATER RECLAMATION,
Gulf South Research Inst., New Orleans, LA. Dept. of Polymer.
I. Cabasso.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-147787, Price codes: A05 in paper copy, A01 in microfiche. Final Report submitted to Office of Water Research and Technology, January 31, 1980. 95 p, 60 Fig, 11 Tab. OWRT-C-B0294-S(No 8521)(1), 14-34-0001-8521(1).

Descriptors: *Membranes, *Reverse osmosis, *Polymers, *Water reuse, *Testing procedures, Porous substrates, Filtration, Reclaimed water, Desalination, Poly(dimethyl phenylene oxide), Ultrafiltration, Composite membranes.

Poly(phenylene oxide) (PPO) polymers were successfully cast into an anisotropic porous substrate, which may be utilized in water reclamation (by ultrafiltration and composite membranes). High hydraulic permeabilities and good mechanical stability are characteristic of these macrovoid-free membranes. The membranes are cast in a continuous fashion to exhibit hydrophobic (or hydrophilic) properties. P-amino-naphthalene sulfonic acid was applied from aqueous solution to chemically interact and produce an ionic, charged surface. Thus, low molecular weight (approximately 250 MW) organo-ionic solutes can be efficiently removed in a low pressure ultrafiltration process. Membrane productivity in this operational mode is very high (50-200 gfd in pressure ranges of 20-100 psi). As such, low molecular weight surfactant separation is possible, and consequently, the purification of water by removal of low molecular weight, neutral, organic contaminants, which are trapped in the transient micelle formation at the membrane-solute interface, is very efficient. The substrate displays a crystalline 'coral' morphology which has the endurance required from the support component of a reverse osmosis membrane. This, combined with the superb chemical stability of the membrane, allows deposition of a permaselective, ultrathin membrane from solvent systems which would dissolve a conventional polysulfone support (e.g., acetone, DMF, DMA). As such, cellulose acetate and cellulose triacetate were deposited on an MPPO support from acetone/dioxane solution. Also, quaternary polymers were deposited onto a sulfonated (sulfonic acid) surface to form a permaselective skin consisting of polyelectrolyte layers.

DESALINATION/POWER CYCLES WITH THE BIPHASE ROTARY SEPARATOR AND TURBINE,
Biphase Energy Systems, Santa Monica, CA.
P. L. Limburg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-150237, Price codes: A05 in paper copy, A01 in microfiche. Final Report prepared for Office of Water Research and Technology, September, 1980. 83 p, 46 Fig, 13 Tab, 11 Ref. OWRT-G90028-D(No 9407)(1), 14-34-0001-9407.

Descriptors: *Desalination, *Desalination process, *Equipment, *Turbines, *Separation techniques, *Separators, Sea water, Flash distillation, Design, *Reverse osmosis, Multiple-effect distillation, Vapor compression, Energy recovery, Costs, Biphase turbine, Rotary Separator, Power production, Cycle studies, Thermal power plants, Waste heat.

The Biphase Rotary Separator Turbine (RST) generates fresh water and power when using salt water as a working fluid. Cycle studies of single- and two-stage RST cycles determined water-production rates to be 0.6 to 1.8 pounds per thousand Btus of heat input and net power-production efficiencies of 2 to 10%, depending on cycle configuration and the maximum saltwater temperature. The Biphase RST can be beneficially integrated with conventional desalination processes. Cycles studied include a topping cycle for distillation plants, shaft-power-source cycle for reverse osmosis and vapor-compression plants, and a reverse-osmosis cycle recovering the reject-brine pressure energy. Short duration tests of a Biphase RST showed that fresh water production (30 ppm TDS) from seawater is feasible. Conceptual design studies were made of a single-stage desalination/power system suitable for a first demonstration plant. The system produces 9000 gallons per day and 90 horsepower from the exhaust-gas energy of a 2125 horsepower diesel engine.

RESEARCH AND DEVELOPMENT ON A SPIRAL-WOUND MEMBRANE SYSTEM FOR SINGLE-STAGE SEAWATER DESALINATION,
UOP, Inc., San Diego, CA. Fluid Systems Div.
R. L. Riley, G. R. Hightower, C. R. Lyons, C. E. Milstead, and M. W. Seroy.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-151953, Price codes: A08 in paper copy, A01 in microfiche. Final Report prepared for Office of Water Research and Technology, March, 1975. 130 p, 59 Fig, 29 Tab, 12 Ref. OWRT (No 3191)(1), 14-30-3191.

Descriptors: *Desalination, *Desalination processes, *Reverse osmosis, *Membranes, Membrane processes, Sea water, Thin-film composite membranes, Spiral elements, Membrane types.

Research and development work under this contract covered the period January 1, 1973 through December 31, 1974. Four distinct types of thin-film composite reverse osmosis membranes were developed and scaled up for incorporation into spiral wound elements. The first membrane had cellulose triacetate formed directly on a porous cellulose nitrate-cellulose acetate support. The second membrane, a polyurea thin film composite (designated as NS-100) was formed by an in-situ interfacial polymerization on a fabric reinforced polysulfone support. Both of these membranes demonstrated salt rejections greater than 99.5% from a 35,000 ppm sodium chloride feed; product water fluxes were in the range of 12 to 17 gal/ft sup 2-day. The third membrane was a polyamide type referred to as PA-100. The fourth and last membrane investigated consisted of a poly (ether/amide) formulation and was designated PA-300. Laboratory tests with the PA-100 and PA-300 membranes showed water fluxes in excess of 23 gal/ft sup 2-day and salt rejection efficiencies greater than 99.3% desalting simulated seawater at 1000 psi. A major part of the program was the development of spiral wound elements from each of these membrane types. Elements were prepared using various methods of construction and adhesives to improve element reliability and minimize flux decline. Field evaluation testing with cellulose triacetate composite membrane elements were conducted at the Sea World Marine Park in San Diego, California. Testing was prematurely terminated after 3200 hours because of problems with excessive membrane fouling.

RESEARCH AND DEVELOPMENT ON A SPIRAL-WOUND MEMBRANE SYSTEM FOR SINGLE-STAGE SEAWATER DESLINATION,
UOP, Inc., San Diego, CA. Fluid Systems Div.
R. L. Riley, C. R. Lyons, C. E. Milstead, M. W. Seroy, and M. Tagami.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-151938, Price codes: A08 in paper copy, A01 in microfiche. Final Report prepared for Office of Water Research and Technology, March 1, 1976. 144 p, 21 Fig, 49 Tab, 7 Ref. OWRT (No 3303)(1), 14-30-3303(1).

Descriptors: *Desalination, *Desalination processes, *Reverse osmosis, *Membranes, Membrane processes, Seawater, Brackish water, Thin-film composite membranes, Spiral elements, Membrane production, Pilot plant.

Work under this contract covered the period January 1, 1975 through December 31, 1975. Emphasis was placed on developing a thin-film composite spiral reverse osmosis membrane system to desalt seawater in a single stage at a maximum pressure of 1,000 psi. Two thin film composite membrane types were developed concurrently to achieve this objective. The first membrane was a cellulose triacetate thin-film on a porous cellulose nitrate - cellulose acetate support. The second membrane was a poly (ether/amide) designated PA-300 cast on a porous polysulfone. A major objective of this program was the design, construction and operation of a fabrication assembly for production of 14-inch wide PA-300 membrane. This machine produced membranes continuously in lengths up to 550 ft. that yielded water fluxes over 20 gals/ft sup 2-day and salt rejections greater than 99.5% while desalting a 35,000 ppm sodium chloride feed at 1000 psi. Extensive field evaluation tests with both 2-inch and 4-inch diameter spiral module elements were conducted on seawater at Sea World, San Diego, California and the OWRT Sea Water Test Facility at Wrightsville Beach, North Carolina. In addition, brackish water desalination studies were undertaken with the PA-300 membrane at the OWRT Brackish Water Test Facility, Roswell, New Mexico. Other areas of research included characterization of PA-300 membrane system properties with regard to wet-dry cycling, chlorine stability and rejection of organic compounds. Additional studies included further optimization of the fabric reinforced poly-sulfane support.

3B. Water Yield Improvement

THE USE OF THE COMPARTMENTED RESERVOIR IN WATER HARVESTING AGRISYSTEMS,
Arizona Water Resources Research Center, Tucson.
B. C. Cluff.
In: Arid Land Plant Resources, Proceedings of the International Arid Lands Conference on Plant Resources, October 8-15, 1978, International Center for Arid and Semiarid Land Studies, Texas Tech. Univ. Lubbock, p 482-500, July, 1979. 5 Fig, 37 Ref. OWRT-B-015-ARIZ(3), 14-01-0001-1425.

Descriptors: *Water harvesting, *Rain water, *Rainfall-runoff relationships, Runoff, *Water conservation, Reservoir evaporation control, *Reservoir storage, Arid lands, Water yield improvement, Water loss, Reservoir design, Surface waters, Water storage, Storage capacity, Computer models, Arizona.

Water harvesting agrisystems or the coupling of artificially collected rain water with agriculture and a surface storage system, offer a promising way of increasing both the quantity and dependability of water in arid and semiarid lands. The use of a compartmented reservoir in conjunction with these agrisystems provides a relatively low-cost efficient method of storage as compared with conventional storage methods. Based on the principle that the division of a conventional reservoir into

compartments with the systematic pumping or transfer of water between compartments can achieve evaporation control through reduction of surface area, these reservoirs are demonstrated here to easily obtain efficiencies in excess of 50-60% where conventional reservoirs of the same depth covering the same area were unable to sustain their own evaporation loss. A computer model has been developed (Crop-76) to study the parameters involved in this compartmented system and their relationship to each other using historical data. This model is briefly described and illustrated through its use in the design of a 16 ha Jojoba water harvesting agrisystem on retired farmland in the Avra Valley 32 km west of Tucson, Arizona. 3C. Use Of Water Of Impaired Quality

APPLICATION OF SEWAGE EFFLUENT TO COLUMNS OF A MOUNTAIN MEADOW SOIL: I. ERRORS IN CALCULATING THE TRANSPORT OF IONIC SALTS,
Colorado State Univ., Fort Collins. Dept. of Agronomy.
K. A. Barbarick, A. Klute, and B. R. Sabey.
Soil Science Society of America Journal, Vol 44, No 5, p 921-924, September/October, 1980. 1 Fig, 3 Tab, 12 Ref.

Descriptors: *Sewage effluents, *Irrigation, *Soil-plant-water relationships, *Municipal wastes, Ion transport, Hayden(CO), Sewage disposal, Salts, Liquid wastes, Environmental effects.

The effects of applying municipal sewage effluent from Hayden, Colorado, on a mountain meadow soil were studied by irrigating soil-packed columns with the effluent for 12 weeks. Some columns were destructively sampled at intervals to determine bulk density and gravimetric moisture content. Five other columns contained porous cups at 7 depths for sampling the extracts. After the steady-state flow had been reached, transport of ionic salts was calculated. An error analysis showed that electrical conductivity measurements in the soil extracts collected in the porous cups would have to be determined to the nearest 0.003 mmho per cm to reduce the calculated flux error to 10% at a 70 cm depth. Error in the fluxes increased with depth. (Cassar-FRC)

IRRIGATION OF INTENSIVELY CULTURED PLANTATIONS WITH PAPER MILL EFFLUENT,
North Central Forest Experiment Station, Rhinelander, WI.
E. A. Hansen, D. H. Dawson, and D. N. Tolsted.
Tappi, Vol 63, No 11, p 139-143, November, 1980. 5 Fig, 2 Tab, 13 Ref.

Descriptors: *Soil-plant water relationships, *Pulp wastes, *Irrigation, *Forest management, Application methods, Industrial wastes, Waste water disposal, Effluents, Disposal, Planting management, Pulp and paper industry, Water pollution.

Use of paper mill effluent to irrigate short-rotation, intensively cultivated plantations of Populus and Salix produced good growth of trees during the 3 years since planting in 1977. Total effluent applied at an average rate of 11 inches per week during the June to September growing season was 11.7 feet in 1977, 10.0 feet in 1978, and 36 feet in 1979. Populus growth averaged 3 feet per year during the first 2 years and 6 to 7 feet the third year. The Mead Corporation mill's output of 32 mgd applied at the rate of 11 inches per week to 750 acres produced 2,600 tons of fiber per year. Concentrations of Na, Cl, and SO4 in groundwater increased greatly, from pretreatment levels of 1, 1, and 4 ppm to 300, 400, and 190 ppm respectively after treatment. K, Ca, Mg, and N increased to a lesser extent. P, Mn, and Al did not change significantly. In order to reduce groundwater pollution, disposal sites should be near rivers or other natural drains. The secondary-treated effluent reaching the groundwater table was of better quality than the tertiary treated effluent normally discharged by the mill into a nearby river. (Cassar-FRC)

EFFECT OF THE SALINITY OF IRRIGATION WATER ON WHEAT YIELD AND SOIL PROPERTIES,
Raja Balwant Singh Coll., Agra (India). Dept. of Agricultural Chemistry.
B. Singh, and P. Narain.
Indian Journal of Agricultural Science, Vol 50, No 5, p 422-427, May, 1980. 3 Fig, 4 Tab, 7 Ref.

Descriptors: *Irrigation water, *Salinity, *Wheat, *Crop response, *Sodium chloride, Adsorption, India, Leaching, Cations, Hydraulic conductivity.

Experiments conducted in the same field during 1972-73 and 1973-74 indicated that wheat could tolerate irrigation with water having a salinity up to 8 mmhos per cm conductivity. When waters with 1.5 and 2 times this conductivity were used, grain yield decreased by 29 and 69% respectively the first season, and 74 and 89% respectively the second season. Wheat was irrigated 4 times in 1972-73 and 5 times in 1973-74. Pearl millet was grown as rotation crop and required 1 irrigation in 1973 and 3 in 1974. Salinity accumulated at a depth of 0 to 60 cm when water having a conductivity of more than 4 mmhos per cm was used, despite leaching by monsoon waters. The sodium adsorption ratio of the irrigation water and of the soil up to a depth of 30 cm increased. Hydraulic conductivity of soil decreased as salinity of irrigation water increased. (Cassar-FRC)

USING SALINE WATER FOR CROP PRODUCTION IN NEW MEXICO,
New Mexico State Univ., Las Cruces. Dept. of Agronomy.
G. A. O'Connor.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-148058, Price codes: A03 in paper copy, A01 in microfiche. New Mexico Water Resources Research Institute, New Mexico State University Technical Completion Report No 127, December, 1980. 26 p, 2 Fig, 5 Tab, 9 Ref, Append. OWRT-A-061-NMEX(1), 14-34-0001-0133.

Descriptors: Salinity, Water management, Groundwater, *Supplemental irrigation, *Salt tolerance, Sorghum, *Crop response, *Impaired water use, Saline water, Irrigation water, *New Mexico, Greenhouse studies.

New Mexico has vast supplies of saline groundwaters whose use could expand irrigated agriculture and conserve good quality water for domestic use. Unfortunately, little is known of the long-term effects of such waters on soils and crops common to New Mexico. Thus, two studies were conducted to determine the feasibility of using various salinity waters (total dissolved solids 1,250-15,000 mg/l). Greenhouse data suggest that the most realistic way to utilize saline waters is as supplements to normal fresh water irrigations. The degree of supplementation possible without severe yield reductions varies inversely with water salinity. However, very saline waters (10,000 and 15,000 mg/l TDS) are not likely to be of practical use for common agricultural crops at any degree of supplementation. Using saline water as the sole source of irrigation water is reasonable for long-term cultivation of common crops only with the lowest salinity water (1,250 mg/l TDS). One season emergencies may be met with waters as saline as 2,500-5,000 mg/l TDS, but continued use will severely reduce yields.

3D. Conservation In Domestic and Municipal Use

ANTICIPATE PIPE FREEZE-UPS,
B. Block.
Water and Wastes Engineering, Vol 17, No 10, p 34-35, October, 1980. 2 Fig.

Descriptors: *Distribution systems, *Freezing, *Temperature control, Equipment, Kansas, Pipes, Potable water, Frost, Measurement, Instrumentation, Ice.

Since winters are very cold in Idaho, the city of Ketchum installed freeze-prevention devices in its new 85,000 ft pipe sewage system to detect frost penetration and reduce the possibility of damage to the system and the wasting of water. The device consists of a temperature probe inserted into a one inch polyvinyl chloride conduit near the pipeline. The pipe has connecting thermistor leads which are adjoined along with the probe to a junction box situated on a utility pole. Each temperature probe is checked on a regular basis by a hand-held temperature meter. Eight temperature probes were installed at dead spots in the water system, and selected hydrants were used throughout the system for water wasting. Construction of the new sewer system took only one summer. Ketchum residents were concerned about freezing in the pipes because many of the residential areas had private wells and were not required to hook up to the municipal supply. Also, a number of the hook-ups were to resort structures that could not guarantee a steady flow demand. After the new system weathered one winter, a dead end section without the frost detection device did freeze up, but the following spring no sign of pipe damage was reported, and the pipe layout in this section was altered to correct the problem. WHAT TO DO WHEN THE WELL RUNS DRY,
J. Walsh.
Science, Vol 210, No 4471, p 754-756, November, 1980.

Descriptors: *Aquifers, *Irrigation systems, *Kansas, Corn, Grain sorghum, Irrigation permits, Groundwater, Agriculture, Cattle, Costs, Water management, Water shortage, Pumping, Great Plains, Water table.

Reductions in supplies of irrigation water in Western Kansas in the summer of 1980 caused drastic decreases in corn crop yields. Grain crops were successfully grown in this region in previous years with heavy irrigation from the Ogallala aquifer. Estimates have shown that the underground water of this area may be depleted in 3 to 20 years, which will cause problems not only in the field of agriculture, but to the beef cattle industry as well. Since corn is most sensitive to drought during the pollination stage, research may aid in shortening the irrigation period to only the most effective segments of crop growth. Alternate crops requiring less irrigation such as grain sorghum are also being cultivated in place of corn. Careful management plans must be executed and cooperation between farmers and government researchers instated to stall the impending depletion of irrigation water supplies. Plans have been considered to set up pumping systems to obtain water from the Missouri River and the Dakota aquifer (an aquifer of the area much further underground) to supplement the water pumped from the Ogallala. The government will also allow owners of aquifer rights to claim depletion allowances to boost farm economies, increase land values, and aid the transition from irrigation farming. (Geiger-FRC)

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

SEEPAGE STUDY OF THE WEST SIDE AND WEST CANALS, BOX ELDER COUNTY, UTAH,
Geological Survey, Salt Lake City, UT. Water Resources Div.
R. W. Cruff.
Utah Department of Natural Resources Technical Publication No 67, 1980. 38 p, 3 Fig, 2 Tab, 1 Ref.

Descriptors: *Canal seepage, *Utah, *Hydrologic data, *Water resources, *Flow nets, Measurement, Water levels, Discharge(Water), Water temperature, Specific conductance, Evaluation, *Box Elder County(UT), *West Side Canal(UT), West Canal(UT).

A study of the gains or losses of the West Side and West Canals from Cutler Reservoir to near Penrose, Box Elder County, Utah, was made to aid in water allocation for the canal system. Four sets of seepage measurements made in 1978 were used in the analysis. Adjustments for fluctuations in flow in the canals were made from information obtained from water-stage recorders operated at selected locations along the canals during the time of each seepage run. The study showed no detectable gain or loss for the West Side Canal and a net loss of 50 cubic feet per second for the West Canal. During the seepage runs, an average of 365 cubic feet per second entered the West Canal, thus the net loss was 13.7% of the available water. About 40% of this loss occurred within about 5% of the length studied on the West Canal.
W81-01026

WATER-RESOURCES RECONNAISSANCE OF THE SOUTHEASTERN PART OF ST. PAUL ISLAND, PRIBILOF ISLANDS, ALASKA,
Geological Survey, Anchorage, AK. Water Resources Div.
A. J. Feulner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-226962, Price codes: A02 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-61, 1980. 12 p, 3 Fig, 2 Tab, 3 Ref.

Descriptors: *Water resources, *Surveys, *Alaska, *Surface waters, *Groundwater resources, Water quality, Water supply, Available water, Aquifer characteristics, Islands, Lakes, Potable water, Salinity, Fish handling facilities, Baseline studies, *St Paul Island(AK).

A hydrologic reconnaissance of the southeastern part of St. Paul Island, Pribilof Islands, Alaska, was made in August 1979 to determine if sufficient freshwater is available for a proposed harbor and fish-processing facility. Only three wells were being used in 1979, two by the community of St. Paul and one by the Coast Guard Loran facility. All wells are in the southeastern part of the island. The island has no established surface drainage, and no springs were found on the eastern part of the island during the survey. Drainage of groundwater from the island is assumed to be by seepage through the sandy deposits along the east coast and possibly by undersea discharge elsewhere on the island. On the basis of present well yields, amount of freshwater inferred to be present below the water table, and potential recharge from precipitation, it is concluded that it should be possible to design a well field in the southeastern part of the island that could yield more than a million gallons per day without danger of inducing saline water into the well field. The water is of good chemical quality. (USGS)

DESIGNING IRRIGATION-CUM-DRAINAGE PONDS FOR ALKALI LANDS,
Central Soil Salinity Research Inst., Karnal (India).
S. K. Gupta, and R. N. Pandey.
Indian Journal of Agricultural Science, Vol 50, No 5, p 428-430, May, 1980. 1 Fig, 2 Tab, 2 Ref.

Descriptors: *Runoff, *Agricultural runoff, Rainfall disposition, *Alkali soils, *Drainage engineering, *Farm ponds, Rice, Storm runoff, Infiltration, Ponds, Surface drainage, Rainfall-runoff relationships, India.

A water balance equation in which the amount of runoff is calculated from precipitation, evaporation, infiltration, depth of detention in crop fields, and duration of storm was used to design a dug-out pond to store storm drainage from rice-planted alkali lands. Although theoretical calculations suggested a 28.2 hectare-cm pond to drain a 6 hectare rice field, actual capacity was measured at 22 hectare-cm. Observed and predicted runoff data agreed closely. A pond capacity satisfactory for this region may be calculated, considering a storm of 2 days with a 10 year return period. Water stored in the ponds may be utilized for other purposes, thus producing additional capacity for storm runoff. As infiltration rates improve with land treatments, more storage is possible. SIMULATED WATER-LEVEL DECLINES NEAR MARIENTHAL, WEST-CENTRAL KANSAS,
Geological Survey, Lawrence, KS. Water Resources Div.
L. E. Dunlap.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-105272, Price codes: A02 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-39, April, 1980. 15 p, 7 Fig, 5 Ref.

Descriptors: *Groundwater, *Aquifers, *Model studies, *Water table, *Kansas, Hydrogeology, Water levels, Irrigations, Pumping, Withdrawal, Mathematical models, Drawdown, Overdraft, Simulation analysis, Projections, Water management(Applied), Hydrographs, West-central Kansas, *Wichita County(KS).

Intensive study in an area of 12-square miles in northeastern Wichita County, Kansas, has shown a decrease of 30 to 50% in saturated thickness of the Ogallala Formation since the development of irrigation. Projections from a digital model indicated the additional water-level declines that might occur from 1978 to 1989 if the pumpage in the model area was assumed to be one-half, equal to, or double the 1977 rate. The additional declines would range from 5 to 15 feet, 15 to 30 feet, and 25 to 40 feet, respectively. If pumpage only in the intensive-study area were assumed to be one-half or double the 1977 rate, water-level declines would range from 10 to 20 feet and from 20 to 25 feet, respectively. Reducing pumpage only in the intensive-study area could reduce the water-level declines locally. However, declines would be greatest near the edge of the area as a result of continued pumpage by wells outside the area. The digital model was more sensitive to changes in pumpage than to changes in hydraulic conductivity, specific yield, or recharge.

GEOLOGIC ASPECTS OF THE SURFICIAL AQUIFER IN THE UPPER EAST COAST PLANNING AREA, SOUTHEAST FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
W. L. Miller.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $3.50 in paper copy, $1.00 in microfiche. Geological Survey Open-File Report 80-586 (WRI), 1980. 2 Sheets, 9 Ref.

Descriptors: *Water management(Applied), *Geology, *Aquifers, *Groundwater, *Florida, Water utilization, Aquifer characteristics, Hydrogeology, Sediments, Planning, Maps, Contours, Cross-sections, *Southeast Florida, St. Lucie County(FL), Martin County(FL), Okeechobee County(FL).

The Upper East Coast Planning Area, as designated by the South Florida Water Management District, consists of St. Lucie County, Martin County, and eastern Okeechobee County. The surficial aquifer is the main source of freshwater for agricultural and urban uses in the area. The geologic framework of the aquifer is displayed by contour mapping and lithologic cross sections to provide water managers with a better understanding of the natural restraints that may be imposed on future development. The surficial aquifer is primarily sand, limestone, shell, silt, and clay deposited during the Pleistocene and Pliocene Epochs. The aquifer is unconfined and under water-table conditions in most of the area, but locally, artesian conditions exits where discontinuous clay layers act as confining units. Impermeable and semipermeable clays and marls of the Tamiami (lower Pliocene) and Hawthorn Formations (Miocene) unconformably underlie the surficial aquifer and form its base. Contour lines showing the altitude of the base of the aquifer indicate extensive erosion of the Miocene sediments prior to deposition of the aquifer materials. (USGS)

COSTS AND BENEFITS OF TERRACES FOR EROSION CONTROL,
Illinois Univ., Urbana-Champaign. Dept. of Agricultural Engineering.
J. K. Mitchell, J. C. Brach, and E. R. Swanson.
Journal of Soil and Water Conservation, Vol 35, No 5, p 233-236, September/October, 1980. 6 Fig, 3 Tab, 9 Ref.

Descriptors: *Erosion control, *Terracing, *Cost-benefit analysis, Feasibility studies, Farm management, Watershed management.

Terrace construction costs were estimated using 1978 data to determine whether terrace systems were economically justifiable to control erosion. Field slopes between 1 and 15% using both the gradient and the tile-outlet-storage type of terrace were considered. All cost and yield considerations were spaced over a 20 yr period. It was determined that six factors affected the cost of the terracing system over the 20 yr: kind of subsoil, slope, type of terrace used, level of management, and soil erodibility. The cost of constructing terraces does not increase at a constant rate with increasing slope. A sharp reversal in the cost curve occurs at a slope of 6% because calculations for slopes of 6% or greater are based on the use of grass backslope terraces, thus reducing the effective field slope, allowing the terraces to be spaced farther apart. For any initial level of productivity, terrace systems are more costly for soils on favorable subsoils than for those on unfavorable subsoils. The highest net benefits are realized on slopes from 4 to 10% because the increases in losses due to erosion tend to cancel out the increased construction costs. The costs of tile-outlet terraces at various levels of initial productivity were about $130 more per acre than for gradient terraces at the end of the 20 yr. The study indicated that the only situation in which terracing increased farm income was when a gradient terrace system was used on highly erodible soils with unfavorable subsoils and at a high level of management. 5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

DIFFERENTIAL PULSE ANODIC STRIPPING VOLTAMMETRY OF COPPER(II) AT THE GLASSY CARBON ELECTRODE,
New Hampshire Univ., Durham. Dept. of Chemistry.
R. B. Smart, and J. H. Weber.
Analytica Chimica Acta, Vol 115, p 331-336, 1980. 3 Fig, 1 Tab, 18 Ref. OWRT-B-004-NH(4).

Descriptors: *Analytical techniques, *Copper, *Fulvic acids, *Assay, *Chemical analysis, *Water pollution, Contamination(Water), Metals, Organic acids, Organic compounds, Polarographic analysis, Analysis, Pollution(Water), Research and development, Estimating, Evaluation, Testing procedures, Measurement, Calibrations, Electrodes, Instrumentation, Monitoring, Testing, Pollutants, Glassy carbon electrode.

The ultimate goal of this study was to use the glassy carbon electrode (GCE) for measurements of metal-complex conditional stability constants, and thus the effect of pH on the GCE response was examined. Also the use of the title technique (DPASV) for copper (II) in potassium nitrate solution was tested to try to utilize lower plating times, yet maintain or improve the limit of detection of the linear scan technique. Detection limits were determined at different pH values, and the usual instrumental parameters were optimized. The DPASV of copper (II) at the GCE gave detection limits similar to those for the rotated GCE, but with much shorter plating times, offering the advantage of decreased analysis time. The GCE had been studied earlier for possible use in monitoring copper (II) ions in a complexiметric titration of naturally-occurring organics in water since the GCE does not adsorb soil fulvic acids, but the two distinct linear regions for the copper (II) calibration curves at pH 4.5 and 6.5 would make it difficult to locate endpoints in such titrations. Also, deviations from linearity at higher copper (II) concentrations suggested that the GCE be used very carefully in these titrations. (Zielinski-IPA)

ASBESTOS FIBRES IN RECEIVING WATERS,
Department of the Environment, Vancouver (British Columbia). Pacific Region.
H. Schreier, and J. Taylor.
Technical Bulletin No 117, 1980. 18 p, 7 Fig, 9 Tab, 63 Ref, 1 Append.

Descriptors: *Asbestos fibres, *Water supply, *Drainage systems, *Toxicity, Hydrologic cycle, Concentrations, Distributions, British Columbia, Water analysis, Water pollution, Asbestos, Evaluation, Public health, Hazards.

Little is known about asbestos fibre concentration in water supplies and drainage systems and the possible health hazard which it could create. A comprehensive review of the subject is provided in this report, which includes results of exploratory studies in British Columbia and the Yukon, and a comparison with concentrations elsewhere in North America. Asbestos fibres, which can be introduced into the hydrologic system by natural and man-made processes, were reported in all phases of the hydrologic cycle. The greatest source appears to be natural exposures of asbestos-bearing bed rock where the fibres are introduced by surface runoff as well as by groundwater drainage. Levels of up to 10 billion fibres/L were measured in natural river systems in British Columbia; these results were significantly higher than those reported for drinking water supplies in eastern Canada and the eastern United States. The concentrations are comparable with those reported from mine effluents in Quebec and groundwater levels in New Mexico. Weathering processes and the abundance of asbestos-bearing metamorphic rocks in British Columbia are thought to be the main causes of these high concentrations. It is suggested that bedrock geology be used as a means of predicting high asbestos concentrations in drainage systems. Finally, for a better understanding of the processes responsible for the asbestos fibre distribution in water systems, it is suggested that an investigation of the transport mechanisms be initiated and that the spatial and seasonal variation in a number of drainage systems be determined. INTERLABORATORY QUALITY CONTROL STUDY NO. 24, ANALYSIS OF EIGHT ACID HERBICIDES IN NATURAL FRESH WATER,
Canada Center for Inland Waters, Burlington (Ontario).
H. Agemian, and A. S. Y. Chau.
Report Series No 67, 1980. 9 p, 4 Fig, 5 Tab, 8 Ref.

Descriptors: *Acid herbicides, *Freshwater, *Pesticide residues, Canadian laboratories, Quality control study, Water quality, Methodology, Standards, Herbicides, Acids, *Laboratory tests, *Analytical techniques, *Canada, Evaluation.

A national interlaboratory quality control study for Canadian laboratories on the determination of eight acid herbicides (MCPA; 2,4-DP; 2,4-D; silvex; MCPB; 2,4,5-T; 2,4-DB; and picloram) in natural fresh water is described. The data show that most laboratories have acceptable expertise for the analysis of silvex; 2,4,5-T; and 2,4-D. No data were reported for MCPB by any laboratory, while only a few participants reported results on MCPA; 2,4-DP; 2,3-DB; and picloram. The overall results indicate that most participants in this study had not attempted the analysis of all eight herbicides. This may reflect the limited expertise in multi-residue analysis of these herbicides in water at the designed concentrations. (WATDOC)

WATER QUALITY OF BEAR CREEK BASIN, JACKSON COUNTY, OREGON,
Geological Survey, Portland, OR. Water Resources Div.
L. A. Wittenberg, and S. W. McKenzie.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $16.75 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-158 (WRI), 1980. 118 p, 26 Fig, 1 Plate, 24 Tab, 56 Ref.

Descriptors: *Water quality, *Oregon, *Irrigation canals, *Surface waters, *Streamflow, Return flow, Irrigation water, Water reuse, Water pollution sources, Sediments, Chemical analysis, Bacteria, Biochemical oxygen demand, Dissolved oxygen, Hydrogen ion concentration, Nutrients, Coliforms, Water temperature, Dissolved solids, Aquatic life, Data collections, *Bear Creek basin(OR), *Jackson County(OR).

Water-quality data identify surface-water-quality problems in Bear Creek basin, Jackson County, Oreg., where possible, their causes or sources. Irrigation and return-flow data show pastures are sources of fecal coliform and fecal streptococci bacteria and sinks for suspended sediment and nitrite-plus-nitrate nitrogen. Bear Creek and its tributaries have dissolved oxygen and pH values that do not meet State standards. Forty to 50% of the fecal coliform and fecal streptococci concentrations were higher than 1,000 bacteria colonies per 100 milliliters during the irrigation season in the lower two-thirds of the basin. During the irrigation season, suspended-sediment concentrations, average 35 milligrams per liter, were double those for the nonirrigation season. The Ashland sewage-treatment plant is a major source of nitrite plus nitrate, ammonia, and Kjeldahl nitrogen, and orthophosphate in Bear Creek. (USGS)

MEASUREMENT OF MERCURY METHYLATION IN LAKE WATER AND SEDIMENT SAMPLES,
Department of Fisheries and Oceans, Winnipeg (Manitoba). Freshwater Inst.
A. Furutani, and J. W. M. Rudd.
Applied and Environmental Microbiology, Vol 40, No 4, p 770-776, October, 1980. 3 Fig, 2 Tab, 38 Ref.

Descriptors: *Mercury, *Microorganisms, *Radiochemical analysis, Analytical technique, Lakes, Freshwater, Lake sediments, Water pollution sources, Methylation, Ontario, Canada.

A new radiochemical technique was used to measure biological mercury methylation in the water column and sediments of Lake Clay (Ontario), a mercury contaminated lake. Samples were collected and incubated, and the solvent extraction method developed by Uthe et al. was modified to extract radioactive methylmercury produced during incubation of the samples. Confirmation of methylation and testing to see that non-biological isotopic exchange was not responsible for methylation were performed. Over a period of 24 weeks, three episodes of methylating activity were detected in the surface floc and in water, each lasting three to five weeks. Periods of methylation in the water column coincided with surface sediment methylation and appeared to be related to overall microbial activity. Mercury was actively methylated in the presence of bound sulfide. (Small-FRC)

DIRECT POTENTIOMETRIC WATER HARDNESS DETERMINATION USING ION-SELECTIVE ELECTRODES,
Eidgenoessische Technische Hochschule, Zurich (Switzerland). Dept. of Organic Chemistry.
P. C. Meier, D. Erne, Z. Cimerman, D. Ammann, and W. Simon.
Mikrochimica Acta, Vol 1, No 5/6, p 317-327, 1980. 3 Fig, 2 Tab, 15 Ref.

Descriptors: *Electrodes, *Hardness(Water), *Assay, Magnesium, Calcium, Water properties, Analytical techniques.

The use of ion-selective electrodes in water hardness determination was evaluated by determining those factors which bear on the measurement of the sum of concentrations of magnesium and calcium. The effects of these factors on the accuracy and precision of the assay were determined. To be competitive with other techniques, direct potentiometric water hardness determinations using ion selective electrodes must be restricted to relatively soft waters. The selectivity factor for magnesium, calcium, and sodium must be within 1.1% of unity if a hardness of 10 degree on the German scale is to be measured to within 0.1 degrees in the composition range of magnesium to calcium concentration ratios of 0.25 to 25. (Small-FRC)

THE EFFECT OF SURFACTANTS, CATIONS, AND COMPLEXING AGENTS ON THE SPECTROPHOTOMETRIC DETERMINATION OF MICROGRAM AMOUNTS OF URANIUM IN WATERS,
Australian Atomic Energy Commission Research Establishment, Lucas Heights.
P. Pakalns.
Mikrochimica Acta, Vol 1, No 5/6, p 339-344, 1980. 1 Tab, 5 Ref.

Descriptors: *Uranium radioisotopes, *Spectrophotometry, *Water analysis, Surfactants, Cations, Heavy metals, Chelation.

Bromo-PADAP (2-(5-bromo-2-pyridylazo)-5-diethyl-aminophenol) was used for the determination of uranium in the presence of surfactants, cations, and complexing agents in natural waters. Cationic, anionic, and non-ionic detergents, phosphate, soap, citric acid, Alamine-336, and mineral oil at concentrations of 100 mg/liter did not interfere in the determination of uranium. Iron(III), nickel(II), copper(II), chromium(III), and vanadium(V) gave additive errors but did not interfere when present in the usual concentrations found in natural waters. Sodium tripolyphosphate (100 ml) and sodium pyrophosphate (20 mg/liter) interfered badly, but a recovery rate of 98% was realized with the addition of 2 mg of thorium. Uranium can be detected at concentrations of 20 micrograms per liter in fresh water and 60 micrograms per liter in salt water if the water is not grossly contaminated with heavy metals. (Small-FRC)
W81-01052

CONCENTRATION AND DETERMINATION OF ORGANIC ACIDS IN COMPLEX AQUEOUS SAMPLES,
Ames Lab., IA.
J. J. Richard, C. D. Chriswell, and J. S. Fritz.
Journal of Chromatography, Vol 199, p 143-148, 1980. 5 Fig, 4 Ref.

Descriptors: *Pollutant identification, *Analytical techniques, *Anion exchange, Gas chromatography, Mass spectrometry, Flame photometry, Organic acids, Rivers, Running waters, Water pollution, Separation techniques, Anaerobic digestion, Waste water, Shales, Oil shales.

Concentration by anion exchange with subsequent elution, esterification, and gas chromatography (GC) is used to analyze water samples from a municipal anaerobic digester, river water and oil shale process water for acidic constituents. After extraction of the acidic sample solutes by anion exchange, neutral organic solutes can be concentrated and determined by conventional resin concentration-GC methods. Compounds identified in the water from the anerobic digester included: benzoic acid, caprylic acid, m-toluic acid, phenylacetic acid, phenylpropionic acid, 3,5-dimethylbenzoic acid, capric acid, B,B-dimethylphenylacetic acid, phenylbutyric acid, MCPP, myristic acid, palmitic acid, abietic acid, 2,4-D, DCPA, and 2,4-dichlorophenol. Compounds identified in the water samples taken from the Skunk River included: benzoic acid, lauric acid, myristic acid, palmitic acid, and stearic acid. The shale oil water samples had a high organic content which appeared to contain very large numbers of complex organic compounds. A considerable number of acidic sulfur compounds were present. The other major compounds appeared to be lower molecular weight carboxylic acids and aromatic acids. Thus the anion-exchange preconcentration procedure followed by esterification and GC analysis works well for a variety of complex aqueous samples. The method is preferable to solvent extraction for concentrating and measuring organic acidic components of water samples. (Baker-FRC)
W81-01067

CONCENTRATION AND DETERMINATION OF POLYCYCLIC AROMATIC HYDROCARBONS IN AQUEOUS SAMPLES ON GRAPHITIZED CARBON BLACK,
Rome Univ. (Italy). Ist. di Chimica Analitica.
A. Lagana, B. M. Petronio, and M. Rotatori.
Journal of Chromatography, Vol 198, No 2, p 143-149, October, 1980. 2 Fig, 3 Tab, 32 Ref.

Descriptors: *Adsorption, *Chromatography, *Aromatic compounds, Analytical techniques, Separation techniques, Water pollution, Organic compounds, Carbon, Rivers, Potable water, Solvents, Water analysis, Molecular structure, Curves.

Polycyclic aromatic hydrocarbons (PAH) are among the compounds for which the US EPA must set maximum limits in effluent waters. Since PAHs often occur in very low levels in water samples, a concentration step is often necessary before analysis. Graphitized carbon black (GCB) has been reported to have a high sorption capacity for certain organic micropollutants. GCB was tested as a concentration device for PAHs prior to liquid chromatography. Various GCB solvent systems (toluene, benzene, dichloromethane, acetonitrile, n-hexane and water) were each spiked with 6 different PAH compounds to estimate partition coefficients and percent recovery of the PAHs. Break-through plots were generated from samples of drinking water or river water to which the PAHs had been added and that were run through the GCB column prior to PAH analysis by high pressure liquid chromatography. Fluoranthene showed different retention and break-through volumes in river and drinking water suggesting the importance of the aqueous system used. Satisfactory recoveries of PAH were obtained using GCB concentration procedures when the composition of the water was considered. Molecular structure of the PAH also affects the efficiency of GCB recovery. The toluene-benzene-acetonitrile (5:2:3) solvent system was also found to give good results for PAH recovery by the GCB method. (Geiger-FRC)

TRACE ELEMENTS IN WATER AND BIOLOGICAL SAMPLES DETERMINED BY X-RAY SPECTROSCOPY,
Institut Rudjer Boskovic, Zagreb (Yugoslavia).
A. Ljubicic, I. Orlic, V. Valkovic, B. Bek, and S. Holjevic.
Progress in Water Technology, Vol 12, No 4, p 513-522, 1980. 5 Fig, 2 Tab, 9 Ref.

Descriptors: *Trace elements, *Water analysis, *X-ray spectroscopy, Chemical analysis, Analytical techniques, Marine animals, Sea water.

Concentrations of trace elements in sea water, drinking water, and marine organisms were determined simultaneously by X-ray spectroscopy. Sensitivities of methods involving three sources of radiation were compared. The proton method using MeV protons from a Van de Graaff accelerator exhibited the highest sensitivity. X-rays from the Mo-tube produced less sensitive results. However, proper choice of fluorescers can increase sensitivity. It is suggested that larger samples be used in the least sensitive method, whose radiation source is Fe55 and Cd109. (Cassar-FRC)

ANALYZING FOR TRACE CHEMICALS IN WATER: A MANAGER'S GUIDE,
D. W. Clark.
Public Works, Vol 111, No 11, p 85-89, November, 1980. 3 Fig.

Descriptors: *Analytical techniques, *Metals, Organic compounds, *Water analysis, *Trace elements, Spectroscopy, Testing procedures.

Commonly used techniques for analysis of trace contaminants in water are summarized and their advantages and weaknesses discussed. Trace metals may be concentrated by ion exchange, evaporation, solvent extraction, and freezing. Analytical methods described are atomic absorption, spectrophotometry, polarography, and neutron activation analysis. Organic compounds may be concentrated by the same methods used for metals, as well as by activated carbon absorption. Gas chromatography, mass spectroscopy, and infrared spectroscopy are widely used to characterize and quantify these compounds. (Cassar-FRC)
W81-01085

A VARIABLE-DEPTH GROUND-WATER SAMPLER,
Rhode Island Univ., Kingston. Dept. of Plant and Soil Science.
C. G. Galgowski, and W. R. Wright.
Soil Science of America Journal, Vol 44, No 5, p 1120-1121, September/October, 1980. 1 Fig, 8 Ref.

Descriptors: *Sampling, *Groundwater, Well casings, Water sampling, Aquifer testing, Water pollution, *Water wells, Instrumentation, Depth sampling, *Water analysis.

A variable-depth ground water sampler for 4 centimeter well casing pipe is described. This sampler, made from inexpensive materials, is adaptable to other sizes of well casings. It can extract water samples at any depth to a theoretical limit of 10 meters. Therefore, only one well is needed to sample pollutants at various depths in an aquifer. Construction materials include plastic tubing, rubber stoppers, bicycle inner tubing, hose clamps, a pressure gauge, 1 liter sample bottle, and a lead weight. By inflating the bicycle tubing, the intake tube can be located at any desired level in the casing. (Cassar-FRC)
W81-01088

RELATIONSHIP OF POLLUTION TO ROCKY SUBSTRATUM POLYCHAETES ON THE FRENCH MEDITERRANEAN COAST,
Centre d'Oceanographie, Marseille (France). Station Marine d'Endoume.
G. Bellan.
Marine Pollution Bulletin, Vol 11, No 11, p 318-321, November, 1980. 5 Fig, 3 Tab, 6 Ref.

Descriptors: *Bioindicators, *Annelids, *Rocks, *Coasts, Water pollution effects, Industrial wastes, Municipal wastes, Outfall sewers, Mediterranean, France.

Polychaetous annelids were studied in the area of the Mediterranean coast east of Marseille where the municipal sewer discharges and along the coast east of the Gulf of Fos, a heavily industrialized port. At different levels of different types of pollutants the distribution of polychaetes in the various rocky biotopes in the upper part of the infralittoral zone showed great qualitative homogeneity. About 15 species accounted for more than 90% of the collected individuals. The Annelid Index of pollution is presented, an index well correlated with the degree of pollution, as well as the Shannon-

Weaver diversity index. Indicator organisms for pollutants (Capitella capitata, Doreillea rudolphii, and others) are opposed to sentinel or detector organisms, which are indicators of pure water. The ratio of the sums of the dominances of these two species groups will furnish the Index. (Small-FRC)

PHOTOLYSIS OF 3,4-DICHLOROANILINE IN NATURAL WATERS,
Nevada Univ., Reno. Div. of Biochemistry.
G. C. Miller, R. Zisook, and R. Zepp.
Journal of Agricultural and Food Chemistry, Vol 28, No 6, p 1053-1056, November/December, 1980. 4 Fig, 4 Tab, 15 Ref.

Descriptors: *Photolysis, *3,4-Dichloroaniline, *Agricultural runoff, *Herbicides, Pesticide residues, Water pollution, Tetrachloroazobenzene, *Solar radiation, Humic acids, Pesticides, Pollutants, Irradiation.

Sunlight irradiation of 3,4-dichloroaniline (DCA) in natural water samples from three rice fields, the Sacramento River, and an alfalfa irrigation ditch resulted in both direct and sensitized photoreactions. A humic acid solution, used as a model natural water, exhibited sensitizing factors similar to those of natural waters. The photolysis rate in irradiated samples of distilled water containing 3,4-dichloroaniline was slower than in natural waters. Formation of 3,4,3',4'-tetrachloroazobenzene, which is similar to TCDD (2,3,7,8-tetrachlorodibenzo-para-dioxin) in structure and toxicological properties, was detected in DCA solutions in natural waters and humic acid solutions, but not in distilled water. Pollutants in natural waters may sensitize photolysis of DCA and may promote different photoproducts. (Cassar-FRC)

AUTOMATIC SEWAGE SAMPLERS: WHAT TO LOOK FOR WHEN BUYING,
EG and G Washington Analytical Services Center, Inc., Rockville, MD.
P. E. Shelley.
American City and County, Vol 95, No 10, p 35-38, October, 1980. 3 Tab.

Descriptors: *Automation, *Water sampling, Waste water, Sewage, Equipment, Water quality, Reviews, Costs, Water analysis.

Increasing legislation for water quality has necessitated improved methods for rapid and accurate wastewater sampling. Some guidelines are offered to aid in choosing the proper automatic sewage sampler from among the many models that are currently marketed. The most important consideration in selecting an automatic wastewater sampler is the type of sample that is desired. A brief review of several sample types including discrete samples, simple composite samples, flow proportional composite samples, sequential composite samples and continuous composite samples is presented. Sequential discrete sampling is generally desired for initial characterization of wastewater flows, and is generally required for stormwater sampling. In addition to twelve main considerations in the selection of an automatic liquid sampler, the equipment should be designed for easy maintenance and quick troubleshooting. An extensive summary of sampler characteristics gives data on the type of collection method used, the flow rate, line velocity and size, lift, sample type, type of installation, cost range, and power required for each unit. The wastewater sampler should be constructed of corrosion-resistant material that is easy to clean. Rapid changes in the automatic liquid sampler field are discussed along with the different sample gathering subsystems, which include suction lifts, vacuum pumps, pneumatic ejection, evacuated bottles and mechanical devices. A listing of automatic liquid sampler manufacturers in the United States and their addresses is also given. (Geiger-FRC)

DETERMINATIONS OF TRACE AMOUNTS OF 9,10-ANTHRAQUINONE IN AQUEOUS SYSTEMS BY DIFFERENTIAL PULSE POLAROGRAPHY,
Trondheim Univ. (Norway). Dept. of Chemistry.
J. O. Bronstad, K. H. Schroder, and H. O. Friestad.
Analytica Chimica Acta, Vol 119, No 2, p 243-249, 1980. 2 Fig, 11 Ref.

Descriptors: *Polarographic analysis, *Pollutant identification, Analytical techniques, 9,10-Anthraquinone, Water pollution, *Pulp wastes, Pulp and paper industry.

A differential pulse polarographic method for the determination of 9,10-anthraquinone is presented. The detection limit of the method is about 2 microg/ml with a standard deviation of 2.4%. The polarographic behavior of 9,10-anthraquinone is very sensitive to and thus dependent upon the nature of the solution and the supporting electrolyte. The most satisfactory results were obtained using 0.1 mg/l tetrabutylammonium tetrafluoroborate dissolved in methanol. Two methods are presented; one is used for cases in which strongly contaminated samples are to be analyzed. For determination of 9,10-anthraquinone in relatively pure substances such as natural waters, a direct extraction procedure with chloroform is recommended. Interfering compounds in the more complex samples are removed by a modified procedure involving steam distillation and extraction. (Baker-FRC)

EFFICIENCIES OF LIQUID-LIQUID EXTRACTION AND XAD-4 AND XAD-7 RESINS IN COLLECTING ORGANIC COMPOUNDS FROM A COKE PLANT'S EFFLUENT,
Illinois Environmental Protection Agency, Springfield.
D. J. Schaeffer, D. C. Tigwell, S. M. Somani, and K. G. Janardan
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 4, p 569-573, October, 1980. 2 Tab, 7 Ref.

Descriptors: *Water analysis, *Waste water pollution, *Sampling, *Organic compounds, *Coke plant effluents, Chemical analysis, Ion exchange resins, Separation techniques, Resins, Ion exchange, Industrial wastes, Effluents

Waste water from a coke plant was analyzed by gas chromatography and mass spectrometry to identify organic compounds and to determine the efficiency of collection methods: liquid-liquid extraction, XAD-4 and XAD-7 resins. The two resins recovered about 40 compounds each at 75% efficiency. By combining the two resins, 63 compounds were identified. Liquid-liquid extraction recovered 90 compounds at 65% efficiency. Using either resin with liquid-liquid extraction recovered about 110 compounds with efficiencies varying from 58.6 to 76.8%. When the total acid fractions were derivatized, 132 to 136 compounds were observed. Efficiency of collection varied from 63.8 to 97.1%. These results suggest that the characterization of complex wastes requires simultaneous collection of samples by several methods. (Cassar-FRC)

MUSSELS (MYTILUS EDULIS) AS 'POINT SOURCE' INDICATORS OF TRACE METAL POLLUTION,
Simon Fraser Univ., Burnaby (British Columbia). Dept. of Chemistry.
J. D. Popham, D. C. Johnson, and J. M. D'Auria.
Marine Pollution Bulletin, Vol 11, No 9, p 261-263, September, 1980. 2 Fig, 9 Ref.

Descriptors: *Mussels, *Water pollution sources, *Outfall sewers, *Trace elements, Marine animals, Lead, Copper, Zinc, Vancouver(Canada), Burrard Inlet(Canada), Harbors, Storm drains, Metals, Bioindicators.

The common blue mussel, Mytilus edulis, was used as an indicator organism in a line transect study to locate within 30 meters a point source discharge of trace metals. Mussels close to a storm water outfall in the port of Vancouver, Canada, showed high levels of copper, zinc, and lead, while those only 30 meters away had baseline levels. A large difference in concentration of trace metals in mussels collected from different sides of one wharf was explained in that the wharf acts as a barrier against mixing of storm drainage water with sea water. The finding that trace metal concentrations in mussels decrease rapidly with distance from a point source indicates that mussels can be used to locate precisely (within 30 km) a point source discharge of trace metals. (Cassar-FRC)

TAXONOMY, POLLUTION AND SLUDGE WORM,
Institute of Ocean Sciences, Sidney (British Columbia). Ocean Ecology Lab.
R. O. Brinkhurst.
Marine Pollution Bulletin, Vol 11, No 9, p 248-251, September, 1980.

Descriptors: *Bioindicators, *Sludge worms, *Oligochaetes, Toxicity, Systematics, Reviews, Biological communities, Water pollution.

This essay on the taxonomy of worms used as bioindicators of pollution discusses the various species of oligochaetes. Although there are about 1000 species known, biologists only have to identify 20 to 30 species on a global basis and only one or two dozen in any habitat type. M ost of the interest in pollution biology deals with field detection methods rather than physiological/toxicological approaches. Family level is usually used rather than species. The development of diversity indexes and the study of toxicology have led to the expansion of interest in worms. The first world meeting of specialists was held in 1979 and included reports on sludge worm taxonomy, evolution, zoogeography, toxicology, life histories, and niche discrimination. (Small-FRC)

PSYCHROPHILES, PSYCHROTROPHS, AND MESOPHILES IN AN ENVIRONMENT WHICH EXPERIENCES SEASONAL TEMPERATURE FLUCTUATIONS,
Laurentian Univ., Sudbury (Ontario). Dept. of Biology.
G. D. Ferroni, and J. S. Kaminski.
Canadian Journal of Microbiology, Vol 26, No 10, p 1184-1191, October, 1980. 9 Tab, 9 Ref

Descriptors: *Microorganisms, *Sediment-water interfaces, *Temperature, Seasonal, Bacteria, Lakes, Canada.

Psychrophilic/psychrotrophic and mesophilic, heterotrophic bacteria were quantified in sediment-water interface samples from a lake which experiences seasonal temperature fluctuations. The psychrophilic/psychrotrophic population ranged from 1212 to 87,000 per ml, and the mesophilic population ranged from 67 to 3783 per ml over the yearly cycle. Pyschrophilic/psychrotrophic bacteria predominated on every sampling occasion. A considerable number of isolates at 37 C were psychrotrophs with broad temperature ranges for growth. A total of 388 isolates were determined and were grouped into 158 working types based on Gram reaction, colony and cell morphology, biochemical activities, and thermal type. (Small-FRC)

Biotechnology and Bioengineering, Vol 22, No 11, p 2359-2373, November, 1980. 6 Fig, 20 Ref.

Descriptors: *Kinetics, *Organic matter, *Microorganisms, Impaired water quality, Waste water(Pollution), Laboratory tests.

The results of an experimental evaluation of the steady-state model of biofilm kinetics and the concept of minimum substrate concentration are presented. With acetate as the growth medium in laboratory-scale biofilm reactors, the steady-state concept of minimum substrate concentration was verified for naturally grown biofilms. As the substrate reached the minimum substrate concentration (0.66 mg/liter for acetate), substrate removal and biofilm thickness declined rapidly. The model successfully predicted substrate utilization and biofilm thickness using independently derived kinetic parameters. The results indicate that organic materials may persist in water and waste water partially because they are in too low concentration to supply sufficient energy to sustain the microorganisms. DETERMINATION OF THE AQUEOUS SOLUBILITIES OF ORGANIC LIQUIDS AT 10.0, 20.0, AND 30.0 C BY ELUTION CHROMATOGRAPHY,
National Bureau of Standards, Washington, DC. National Measurement Lab.
F. P. Schwarz, and J. Miller.
Analytical Chemistry, Vol 52, No 13, p 2162-2164, November, 1980. 3 Tab, 14 Ref.

Descriptors: *Organic compounds, *Solubility, *Chromatography, Solvents, Aqueous solutions, Analytical techniques, Spectrophotometry, Temperature, Toxins, Path of pollutants, Water pollution, Aromatic compounds, Pollutant identification.

To better understand the fate and solubility properties of toxic organics in the aquatic environment, the solubilities of several organic liquids were determined at various temperatures by elution chromatography. Aqueous solubilities of cholorbenzene, m-dichlorobenzene, diethyl phthalate, dibutyl phthalate, toluene, 1,1,1-trichloroethane and 1,1,2,2-tetrachloroethane were determined at 10.0, 20.0, and 30.0 C. Aqueous solubilities of ethylbenzene and o-dichlorobenzene were determined at 20.0 and 30.0 C. Results from the benzene derivatives were compared with those determined by UV absorption measurements made on the solution phase. Of the nineteen benzene solubilities determined by elution chromatography, fifteen were in agreement with results obtained by UV absorption within an experimental error of 4%. Elution chromatography results for the chloroethane derivatives were in even closer agreement with aqueous solubilities measured by UV absorption, with an experimental error of 2%. Solubilities recorded ranged from 0.00111 wt% for dibutyl phthalate at 20.0 C to 0.385 wt% for 1,1,2,2-tetrachloroethane at 20.0 C. (Geiger-FRC)

A WELL-HEAD INSTRUMENT PACKAGE FOR MULTI-PARAMETER MEASUREMENT DURING WELL WATER SAMPLING,
California Univ., Livermore. Environmental Sciences Div.
G. Garvis, and D. H. Stuermer.
Water Research, Vol 14, No 10, p 1525-1527, October, 1980. 3 Fig, 4 Ref.

Descriptors: *Design criteria, *Groundwater, *Water wells, Data collections, Monitoring, Water sampling, *Water analysis, Well data, Design data, Wells, Water pollution, Data transmission, Measurement, Sampling, Hydrogen ion concentration, Oxidation-reduction potential, Conductivity, Temperature.

A new design for a portable well-head instrument package improves groundwater sampling and continuous monitoring of pH, redox potential, conductivity and temperature. These parameters are considered useful indicators of possible contamination from the well itself. The new instrument consists of probes attached to the well-head and connected to digital display meters housed in a separate insulated carrying case. This system has been used in several monitoring programs. It functions reliably, is convenient and improves the accuracy of pH and redox potential measurements. (Titus-FRC)

SEDIMENT OXYGEN DEMAND TECHNIQUES: A REVIEW AND COMPARISON OF LABORATORY AND IN SITU SYSTEMS,
Wisconsin Univ., Madison. Lab. of Hygiene.
G. T. Bowman, and J. J. Delfino.
Water Research, Vol 14, No 5, p 491-499, May, 1980. 3 Fig, 10 Tab, 56 Ref.

Descriptors: *On-site laboratories, *Analytical techniques, *Sediments, *Water analysis, *Chemcial oxygen demand, Testing procedures, Water pollution, Laboratory tests, Materials testing, Dissolved oxygen, Water measurement, Sampling, Instrumentation.

Sediment oxygen demand measurement techniques are reviewed and improvements are recommended. In comparisons of data from among two or more techniques, methodological differences were identified as the greatest source of variations. Five principal analytical systems are used to evaluate sediment oxygen demand: (1) batch, which includes laboratory and in situ; (2) continuous flow; (3) manometric; (4) electrolytic; and (5) dehydrogenase activity. Comparison of methods requires establishment of criteria to determine whether the methods are acceptable. These criteria are: (1) consistency; (2) reproducibility; and (3) efficiency. Laboratory techniques meet the criteria more readily than in situ techniques, because many factors including temperature, turbidity, light, and current velocity cannot be controlled in situ. A sediment oxygen demand reaction chamber has been designed and meets the criteria. It gives an optimum volume to surface ratio and provides results in less than 24 hours. Based on experiments, the 24 hour period decreases the possiblity of error due to initial chemical oxygen demand. (Titus-FRC)

CHEMICAL AND SPECTROSCOPIC CHARACTERIZATION OF HUMIC SUBSTANCES DERIVED FROM RIVER SWAMPS IN THE FLOOD PLAINS OF SOUTHEASTERN U.S. COASTAL STREAMS,
Georgia Inst. of Tech., Atlanta. School of Geophysical Sciences.
J. H. Reuter.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-150245, Price codes: A05 in paper copy, A01 in microfiche. Environmental Resources Center, Georgia Institute of Technology, Project Completion Report ERC 06-08, September, 1980. 66 p, 16 Fig, 11 Tab, 23 Ref. OWRT-B-132-GA(1).

Descriptors: *Chemical analysis, *Spectroscopy, *Soil analysis, *Humic acids, *Fulvic acids, *Swamps, *Flood plains, Coasts, Instrumentation, Nutrients, Analysis, Decomposing organic matter, Organic soils, Acids, Organic compounds, Chelation, Wetlands, Humus, Trace elements, Soil chemical properties.

Samples were taken from surface peat from the Okefenokee swamp, from surface soils and sediment cores in the Altamaha flood plain, and analyzed. Several distinct fractions of river swamp related humic substances were identified by chemical/spectroscopic methods. The results showed that humic substances are abundantly synthesized in river swamps and are both stored in soils and exported into the overlying or percolating waters. Water-soluble humus derived from peat appeared to be of a lower degree of humification and condensation than both the aquatic humus from swamp waters and swamp soil fulvic acids (FA), and may hence be a chemical precursor of both. Aquatic humus resembled soil FA in chemical composition and acidic functional group content (AFGC). Relative to 'average' soils, swamp soils were depleted in low molecular weight FA, probably due to intensive percolation by flood waters. Data on soil humic acids (HA) and FA abundance and their AFGC were used to estimate metal-binding capacities of the swamp soil due to humic substances. Metal-binding studies with swamp soil HA and FA confirmed their ability to complex potential pollutant metals. (Zielinski-IPA)

ST. LAWRENCE RIVER WATER QUALITY SURVEYS, 1977,
Canada Centre for Inland Waters, Burlington (Ontario).
C. H. Chan.
Scientific Series No 113, 1980. 16 p, 17 Fig, 3 Tab, 9 Ref.

Descriptors: *Water quality, Nutrients, *Surveys, Mean concentrations, Physical parameters, Ions, Metals, *St. Lawrence River, Sampling, Surveys, Data collection, Polychlorinated biphenyls, Water pollution sources, *Path of pollutants, International waters.

Six water quality surveys were carried out in 1977 on the international section of the St. Lawrence River. Results compared with 1973-1974 data showed no apparent change in the water quality of the river. Nutrient concentrations (nitrate and phosphorus) increased progressively downstream, especially downstream from Brockville. High inputs of metals from United States tributaries were found in areas of the St. Lawrence below Massena. High levels of PCB were detected in the Grass River. (WATDOC)

STATISTICAL ANALYSES OF SURFACE-WATER-QUALITY VARIABLES IN THE COAL AREA OF SOUTHEASTERN MONTANA,
Geological Survey, Helena, MT. Water Resources Div.
J. R. Knapton, and R. F. Ferreira.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-226020, Price codes: A07 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-40, June, 1980. 128 p, 2 Fig, 4 Tab, 17 Ref.

Descriptors: *Water quality, *Streams, *Montana, Coal mines, *Chemical analysis, Anions, Cations, Dissolved solids, Specific conductivity, Trace elements, Sediment transport, Water temperature, Path of pollutants, Water utilization, Irrigation, Cattle, Water analysis, Evaluation, *Southeastern Montana.

Since 1974 a network of water-quality stations has been operated in the coal area of southeastern Montana. This report updates a previous report with 2 years of additional data collection and presents statistics and regression equations for water-quality variables. The most apparent feature of the study is the variability of water quality. Time-trend differences are most noticeable, with areal differences being present but more subtle. In comparing stations at the mouths of the five major drainages entering the Yellowstone River from the study area, water from the Powder River ranks near the middle of the group in dissolved-solids concentration (mean of 1,390 mg/L), but far exceeds the other drainages in suspended-sediment concentration, often exceeding 10,000 mg/L. The Tongue River generally has the best overall quality with respect to dissolved constituents; extremes are moderated by mixing in the Tongue River Reservoir.

Suspended sediment ranged from 5 to 4,360 mg/L. Rosebud Creek shows about a 50-percent average increase in dissolved-solids concentration from the most upstream station to the mouth. Armells and Sarpy Creeks, smallest of the five drainages, have a pool-riffle configuration that influences both dissolved and suspended constituents. Pools permit greater evaporation, thus increasing dissolved-constituent concentrations. They also act as sediment traps. (USGS)

A ONE-DIMENSIONAL, STEADY-STATE, DISSOLVED-OXYGEN MODEL AND WASTE-LOAD ASSIMILATION STUDY FOR LITTLE LAUGHERY CREEK, RIPLEY AND FRANKLIN COUNTIES, INDIANA,
Geological Survey, Indianapolis, IN. Water Resources Div.
C. G. Crawford, W. G. Wilber, and J. G. Peters.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $9.00 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-74, January, 1980. 64 p, 24 Fig, 11 Tab, 57 Ref.

Descriptors: *Model studies, *Dissolved oxygen, *Waste assimulative capacity, *Water quality, *Indiana, Streams, Streamflow, Low flows, Reaeration, Water pollution, Waste water disposal, Waste water treatment, Biochemical oxygen demand, Nitrification, Ammonia, Nitrates, Nutrients, Mathematical models, *Ripley County(IN), *Franklin County(IN), Little Laughery Creek(IN).

A digital model calibrated to conditions in Little Laughery Creek triutary and Little Laughery Creek, Ripley and Franklin Counties, Ind., was used to predict alternatives for future waste loadings that would be compatible with Indiana stream water-quality standards defined for two critical hydrologic conditions, summer and winter low flows. Natural streamflow during the summer and annual 7-day, 10-year low flow is zero. Headwater flow upstream from the wastewater-treatment facilities consists solely of process cooling water from an industrial discharger. This flow is usually less than 0.5 cubic foot per second. Consequently, benefits from dilution are minimal. As a result, current and projected ammonia-nitrogen concentrations from the municipal discharges will result in in-stream ammonia-nitrogen concentrations that exceed the Indiana ammonia-nitrogen toxicity standards (maximum stream ammonia-nitrogen concentrations of 2.5 and 4.0 milligrams per liter during summer and winter low flows, respectively). Benthic-oxygen demand is probably the most significant factor affecting Little Laughery Creek and is probably responsible for the in-stream dissolved-oxygen concentration being less than the Indiana stream dissolved-oxygen standard (5.0 milligrams per liter) during two water-quality surveys. After municipal dischargers complete advanced waste-treatment facilities, benthic-oxygen demand should be less significant in the stream dissolved-oxygen dynamics. (USGS)

WATER RESOURCES OF BOULDER COUNTY, COLORADO,
Geological Survey, Denver, CO. Water Resources Div.
D. C. Hall, D. E. Hillier, D. Cain, and E. L. Boyd.
Available from the Colo. Geol. Survey, 1313 Sherman St., Denver, CO 80202, Price: $8.00 in paper copy. Colorado Department of Natural Resources Bulletin 42, 1980. 97 p, 19 Fig, 1 Plate, 23 Tab, 56 Ref.

Descriptors: *Water resource, *Colorado, *Water quality, *Groundwater, *Surface waters, Streamflow, Precipitation(Atmospheric), Evapotranspiration, Surface runoff, Hydrogeology, Water wells, Aquifers, Aquifer characteristics, Water yield, Water table, Water quality standards, Septic tanks, Water pollution sources, Hydrologic data, *Boulder County(CO), South Platte River basin(CO), Front Range Urban Corridor(CO).

Surface water is abundant in Boulder County, Colo., because large amounts of precipitation fall in the higher mountains and this precipitation feeds the streams directly or indirectly throughout the year. Ground water is an important source of water mostly for domestic, stock, or limited-acreage irrigation needs. The most frequently used aquifers are flood plain, terrace, Laramie-Fox Hills, Pierre-Niobrara-Benton, and crystalline rock. Median well yields of 15 or more gallons per minute occur for the flood plain, terrace, and Laramie-Fox Hills aquifers. The chemical and bacterial quality of the surface water is best at higher altitudes and decreases as the streams flow easterly to the plains and leave the county. The changes in water quality are influenced by the hydrogeology and the activities of man such as mining, farming, and sewage disposal. Many sources of water examined failed to meet Colorado Department of Health water-quality standards for raw drinking-water use, for agricultural use, and for aquatic life. Chemical quality of the ground water, particularly dissolved solids, is better in water from the unconsolidated- and crystalline-rock aquifers in the mountains and decreases in the aquifers on the plains. Factors involved in the decrease of quality are the geohydrology and the quality of associated surface water. Local contamination of ground water by subsurface wasterwater disposal is a frequent problem. (USGS)

WATER-QUALITY ASSESSMENT OF THE PORTER COUNTY WATERSHED, KANKAKEE RIVER BASIN, PORTER COUNTY, INDIANA,
Geological Survey, Indianapolis, IN. Water Resources Div
L. L. Bobo, and D. E. Renn
Available from the OFSS, USGS Box 25425, Fed Ctr., Denver, CO 80225, Price: $7.50 in paper copy, $4.50 in microfiche. Geological Survey Open-File Report 80-331, February, 1980. 54 p, 9 Fig, 11 Tab, 27 Ref.

Descriptors: *Water quality, *Surface waters, *Watersheds(Basins), *Municipal wastes, *Indiana, Streams, Water analysis, Chemical analysis, Water pollution sources, Dissolved solids, Dissolved oxygen, Sediments, Bacteria, Pesticides, Polychlorinated biphenyls, Coliforms, Phytoplankton, Evaluation, *Kankakee River basin, Porter County(IN).

Water type in the 241-square mile Porter County watershed in Indiana, was calcium bicarbonate or mixed calcium bicarbonate and calcium sulfate. Concentrations of dissolved chemical constituents in surface water and contents of chlorinated hydrocarbons in streambed samples in the watershed were generally less than water-quality alert limits set by the U.S. Environmental Protection Agency, except in Crooked Creek. During sampling, this stream was affected by sewage, chlorinated hydrocarbons, and two chemical spills. Ranges of on-site field measurements were: specific conductance, from 102 to 1,060 micromhos per centimeter at 25 Celcius; water temperature, from 7.0 to 31.8 Celsius; pH, from 6.8 to 8.9; dissolved oxygen, from 2.5 to 14.9 milligrams per liter and from 27 to 148% saturation; and instantaneous discharge from 0 to 101 cubic feet per second. Concentrations of most dissolved-inorganic constituents (heavy metals and major ions) and dissolved solids did not vary significantly from one sampling period to the next at each site. Dissolved constituents whose concentrations varied significantly were iron, manganese, organic carbon, ammonia, nitrate plus nitrite, organic nitrogen, Kjeldahl nitrogen, and phosphorus. Concentrations of dissolved manganese, organic carbon, dissolved nitrite plus nitrate, and suspended sediment varied seasonally at most sites. Populations and identification of bacteria, phytoplankton, periphyton, and benthic invertebrates indicate a well-balanced environment at most sites, except in Crooked Creek. (USGS)

AN ECONOMIC ANALYSIS OF SELECTED STRATEGIES FOR DISSOLVED-OXYGEN MANAGEMENT: CHATTAHOOCHEE RIVER, GEORGIA,
Geological Survey, Reston, VA. Water Resources Div.
J. E. Schefter, and R. M. Hirsch.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $3.00. Geological Survey Professional Paper 1140, 1980. 26 p, 16 Fig, 13 Tab, 5 Ref, Append.

Descriptors: *Cost analysis, *Dissolved oxygen, *Streams, *Water pollution sources, *Georgia, Water quality control, Planning, Powerplants, Inflow, Waste assimilative capacity, Model studies, Simulation analysis, Economic efficiency, Evaluation, *Chattahoochee River(GA), *Buford Dam(GA).

A method for evaluating the cost-effectiveness of alternative strategies for dissolved-oxygen (DO) management is demonstrated, using the Chattahoochee River, GA., as an example. The conceptual framework for the analysis is suggested by the economic theory of production. The minimum flow of the river and the percentage of the total waste inflow receiving nitrification are considered to be two variable inputs to be used in the production of given minimum concentration of DO in the river. Each of the inputs has a cost: the loss of dependable peak hydroelectric generating capacity at Buford Dam associated with flow augmentation and the cost associated with nitrification of wastes. The least-cost combination of minimum flow and waste treatment necessary to achieve a prescribed minimum DO concentration is identified. Results of the study indicate that, in some instances, the waste-assimilation capacity of the Chattahoochee River can be substituted for increased waste treatment; the associated savings in waste-treatment costs more than offset the benefits foregone because of the loss of peak generating capacity at Buford Dam. The sensitivity of the results to the estimates of the cost of replacing peak generating capacity is examined. It is also demonstrated that a flexible approach to the management of DO in the Chattahoochee River may be much more cost effective than a more rigid, institutional approach wherein constraints are placed on the flow of the river and(or) on waste-treatment practices. (USGS)

GEOCHEMISTRY OF WATER IN THE FORT UNION FORMATION OF THE NORTHERN POWDER RIVER BASIN, SOUTHEASTERN MONTANA,
Geological Survey, Helena, MT. Water Resources Div.
R. W. Lee
Available from the OFSS, USGS Box 25425, Fed Ctr., Denver, CO 80225, Price: $8.00 in paper copy, $4.50 in microfiche. Geological Survey Open-File Report 80-336 (WRI), June, 1980. 17 p, 7 Fig, 2 Plates, 2 Tab, 18 Ref.

Descriptors: *Geochemistry, *Groundwater, *Water quality, *River basins, *Montana, Hydrogeology, Streams, Water chemistry, Springs, Water wells, Bacteria, Cation exchange, *North Powder River basin(MT), Southeastern Montana

Shallow water in the coal-bearing Fort Union Formation of southeastern Montana was investigated to provide a better understanding of the geochemistry. Springs, wells less than 200 feet deep, and wells greater then 200 feet deep were observed to have different water qualities. Overall, the ground water exists as two systems: a mosaic of shallow, chemically dynamic, and localized recharge-discharge cells superimposed on a deeper, chemically static regional system. Water chemistry is highly variable in the shallow system, whereas sodium and bicarbonate waters characterize the deeper system. Within the shallow system, springs, and wells less than 200 feet deep show predominantly sodium and sulfate enrichment processes from recharge to discharge. These processes are consistent with the observed aquifer mineralogy and aqueous chemistry. However, intermittent mixing with downward moving recharge waters or upward

moving deeper waters, and bacterially catalyzed sulfate reduction, may cause apparent reversals in these processes. (USGS)

INPUT INTO AND FATE OF LEAD IN A SMALL RESERVOIR,
Rutgers - The State Univ., New Brunswick, NJ. Water Resources Research Inst.
A. W. McIntosh, J. V. Hunter, and P. Krug.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-148074, Price codes: A03 in paper copy, A01 in microfiche. Final Technical Completion Report, October, 1980, 31 p, 3 Fig, 13 Tab, 27 Ref. OWRT-A-056-NJ(1), 14-34-0001-0132.

Descriptors: *Lead, Heavy metals, *Storm runoff, *Reservoirs, Inflow, *Land use, Environmental effects, Drainage area, Sediments, Cores, Sampling, Fish physiology, New Jersey, *Weston's Mill Pond(NJ).

Lead (Pb) concentrations in water samples collected from seven sites in Weston's Mill Pond, NJ., a water supply/recreation reservoir exposed to substantial amounts of highway runoff, under varying meteorological conditions ranged from 18.3 to 34.9 ug/l. Highest average concentration over all sites (46.4 ug Pb/l) occurred after a period of heavy rainfall. The non-filterable fraction accounted for 80 to 96% of the total lead present in the water. Lead concentrations in the upper 2 cm of sediment cores were as high as 439.7 ug/g (dry weight), and elevated levels existed throughout the cores (22.5 cm in depth) at some sites. Lead concentrations in the tissues of four species of fish collected from the reservoir consistently occurred in the following order: gills > liver > muscle, with levels in the muscle less than 1 ug Pb/g (dry weight basis). Estimated loading of lead to the reservoir via a major tributary during a storm event was 3.22 pounds, with levels in the tributary reaching a maximum of 1.94 mg Pb/l during the storm. BEHAVIOUR OF PHOSPHATE IN ESTUARINE WATER,
Melbourne Univ., Parkville, (Australia), Marine Chemistry Lab.
J. D. Smith, and A. R. Longmore.
Nature, Vol 287, No 5782, p 532-534, October 9, 1980. 3 Fig, 1 Tab, 21 Ref.

Descriptors: *Phosphates, *Estuaries, *Iron compounds, *Water pollution, *Yarra River(Australia), Humic acids, Waste water(Pollution), Rivers, Sedimentology, Model studies, Phosphorus compounds, Inorganic compounds, Laboratory tests.

Since 1977 measurements of phosphate during high and low flow in the waters of the Yarra River estuary (Australia) showed wide variations, laboratory experiments were designed to study some of the non-biological factors in phosphate distribution. Results showed that the sequence and concentration of the additions of iron, humic acid, and phosphate to the river largely controlled the proportion of phosphate removed from solution in river water. Less than 10% inorganic removal of phosphate occurred in estuaries fed by rivers of average iron content. In the laboratory system, sea water was pumped into a vessel containing river water, and the mixture pumped out at the same rate. In the sample of river water used, 94.5% of the iron and 42% of the phosphate were associated with the particulate matter. Removal of iron was 70%; humic acid, 23%; and phosphate, 6%, with the salinity of maximum removal different for each component. A series of experiments using synthetic starting solutions showed that a maximum of 44% phosphate was removed in the presence of high levels of iron and humic acid (starting solution, 9 mg humic acid, 750 mg iron, and 200 micrograms phosphate per liter). (Cassar-FRC)

ALGAL AVAILABILITY OF SEDIMENT PHOSPHORUS IN DRAINAGE WATER OF THE BLACK CREEK WATERSHED,
Purdue Univ., Lafayette, IN. Agricultural Experimental Station.
R. A. Dorich, D. W. Nelson, and L. E. Sommers.
Journal of Environmental Quality, Vol 9, No 4, p 557-563, October/December, 1980. 1 Fig, 4 Tab, 18 Ref.

Descriptors: *Agricultural watersheds, *Phosphorus, *Algae, Sediment-water interfaces, Laboratory tests, Sediment load, Indiana, Eutrophication.

The algal availability of phosphorus in suspended stream sediments of the Black Creek Watershed (Indiana) and the phosphorus fractions in suspended stream sediments which are available to algae were evaluated. Sediments suspended in the agricultural watershed were separated, resuspended in a nutrient medium, inoculated with Selanastrum capricornutum, and incubated for two weeks under illumination. Before and after incubation, the media were analyzed for algal numbers and phosphorus assimilated by algal cells by sequential extraction with NH4F, NaOH, and HCl. Available sediment phosphorus in March and June samples averaged 20.7% of the total sediment phosphorus and 30.1% of the sediment inorganic phosphorus. Sediment phosphorus contributed significantly larger quantities of phosphorus than soluble phosphorus for algal growth during incubation. (Small-FRC)

LITTERFALL, STEMFLOW, AND THROUGHFALL NUTRIENT FLUXES IN AN ALLUVIAL SWAMP FOREST,
East Carolina Univ., Greenville, NC. Dept. of Biology.
M. M. Brinson, H. D. Bradshaw, R. N. Holmes, and J. B. Elkins, Jr.
Ecology, Vol 61, No 4, p 827-835, August, 1980. 2 Fig, 4 Tab, 51 Ref.

Descriptors: *Nutrients, *Swamps, *Forests, Stemflow, Leaves, Humus, Cycling nutrients, Wetlands, Throughfall, Fluctuations, Canopy, Seasonal, Leaching, Weathering.

The nutrient cycling capacity of an alluvial forest of the Coastal Plain of North Carolina was compared with other wetland and upland ecosystems on which data was available. Sediments in the alluvial swamp forest are characterized by a higher concentration of exchangeable calcium and potassium and support more rapid growth of the water tupelo, Nyssa aquatica, than soils in non-alluvial headwater swamps. The annual litterfall of the study area was 6428 kilograms dry mass/hectare; 63% of this was N. aquatica leaves. Deposition of nutrients onto the forest floor in kilograms/hectare/year for litterfall and aqueous sources, respectively, were calculated to be 2779 and 91.5 for organic carbon, 5.38 and 1.55 for phosphorus, 17.0 and 7.60 for magnesium, 72.77 and 10.31 for nitrogen, 7.19 and 9.21 for sulfur, 45.1 and 15.31 for calcium, and 21.1 and 11.96 for potassium. Values for these nutrients in mature upland temperate forests and still-water swamps have been reported to be lower. The high values for nitrogen and phosphorus in the alluvial forests were suspected of originating from fluvial sources, while atmospheric sinks and weathering formed the major nutrient inputs for upland forests and still-water swamps. (Geiger-FRC)

DETRITAL PROCESSING AND ASSOCIATED MACROINVERTEBRATES IN A COLORADO MOUNTAIN STREAM,
Colorado State Univ., Fort Collins. Dept. of Zoology and Entomology.
R. A. Short, S. P. Canton, and J. V. Ward.
Ecology, Vol 61, No 14, p 727-732, August, 1980. 5 Fig, 3 Tab, 18 Ref.

Descriptors: *Natural streams, *Leaves, *Invertebrates, Degradation, Organic matter, Organic loading, Colorado.

A study of leaf processing in a Colorado mountain stream was initiated to determine the processing rates of four common species of leaves, the nature of the macroinvertebrates which colonize leaf litter, the importance of leaf litter as a source of, or collecting system for, fine particulate organic detritus, and finally, the importance of leaf litter as a habitat for fine particle-feeding detritivores. Processing occurred at rapid rates despite water temperatures at or near zero degrees centigrade. A high biomass of shredders was found per gram of leaf pack, which explains the rapid processing. Fine particulate organic matter may accumulate in leaf packs from two potential sources: leaf material in the pack as it is processed, and fine organic matter in transport which is trapped in the leaf pack. VARIABILITY AND LOADING OF MERCURY IN A SMALL PRAIRIE RIVER,
W. D. Gummer.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 4, p 530-536, October, 1980. 4 Fig, 14 Ref.

Descriptors: *Mercury, *Rivers, *Sediments, *Water pollution, *Moose Jaw River(Saskatchewan), Thunder Creek, Saskatchwan, Pollutants.

The magnitude and variability of mercury levels in the Moose Jaw River, Saskatchewan, were investigated during a high flow period. Water samples of 500 ml were collected hourly for 35 days, April 18 to May 22, 1979. The maximum total mercury level, 0.13 micrograms per liter, in water samples occurred at peak flow and corresponded with suspended sediment and particulate organic carbon maxima. Suspended sediment mercury levels were generally 0.15 micrograms per gram. However, on one occasion, erosion in the Thunder Creek tributary produced a suspended sediment mercury concentration of 0.58 microliters per gram. Although particulate mercury was the predominant form, dissolved mercury increased slightly during peak flow, with maximum levels coinciding with a drop in suspended sediment and particulate organic carbon levels. COINCIDENCE OF CADMIUM AND ANTIBIOTIC RESISTANCE IN NEW YORK BIGHT APEX BENTHIC MICROORGANISMS,
Rutgers - The State Univ., New Brunswick, NJ. Center for Coastal and Environmental Studies.
M. A. Devanas, C. D. Litchfield, C. McClean, and J. Gianni.
Marine Pollution Bulletin, Vol 11, No 9, p 264-269, 1980. 1 Fig, 2 Tab, 26 Ref.

Descriptors: *Chemicals, *Cadmium, *Benthic fauna, *Microorganisms, *Atlantic Ocean, Water pollution sources, Sludge disposal, Industrial wastes, Spoil banks, Dredging, Antibiotic resistance, Drug resistance, *New York Bight apex.

Microorganisms resistant to 1-500 ppm cadmium were isolated and tested for antibiotic resistances. Sediment samples were collected in the New York Bight apex in a sewage sludge disposal area, a dredge spoils area, an industrial acid wastes dumping area, and other sites. Sixty-nine cadmium resistant isolates were tested for antibiotic resistance with a spectrum of antibiotics: sulfachloropyridazine, penicillin, bacitracin, tetracycline compounds, streptomycin mixture, novobiocin, neomycin, nalidixic acid, ampicillin, kana-

mycin, and chloramphenicol. Ninety-four percent of the microorganisms exhibited antibiotic resistance to at least one of the compounds tested, while 91% displayed a multiple drug resistance pattern. The possibility of extrachromosomal linkage of cadmium and streptomycin resistance is discussed. (Small-FRC)

VIRUSES IN GROUNDWATER,
Baylor Coll. of Medicine, Houston, TX.
B. H. Keswick, and C. P. Gerba.
Environmental Sciences and Technology, Vol 14, No 11, p 1290-1297, November, 1980. 1 Fig, 6 Tab, 56 Ref.

Descriptors: *Water quality, *Viruses, *Groundwater, Waste disposal, Land use, Public health, Diseases, Water pollution sources, Reviews.

A literature review is presented on viruses in groundwater in order to evaluate the present state of knowledge, assess current standards and monitoring practices, and recommend areas of research. Viruses have been isolated from groundwater sources and drinking water and from sites where land application or waste water experimentation is practiced. These viruses include Echo, Polio, Coxsackie, Rota, and B viruses. There are a growing number of studies of isolation of viruses in groundwater after land application of wastes, although there have been no disease outbreaks associated with these sites. More studies are needed on the survival of viruses in groundwater and their ability to migrate long distances. Also, monitoring virus concentration in land application areas after rainfall and under various geological conditions is proposed. (Small-FRC)

MASS BALANCE,
Anglian Water Authority, Huntingdon (England). Directorate of Resource Planning.
A. E. Warn, and J. S. Brew.
Water Research, Vol 14, No 10, p 1427-1434, October, 1980. 2 Fig, 4 Tab, 13 Ref.

Descriptors: Discharge, *Discharge measurement, *Flow, Monte Carlo method, *Effluents, *Hydrologic equation. Simulation analysis, *Model studies, Channel flow, Hydraulics, Water pollution, Mathematical studies, Statistical models, Computer models, Numerical analysis, Surface waters, Computers, Water quality control.

Two methods for calculating mean and percentile values of river quality downstream of a discharge are compared. Both relate percentile values of downstream water quality to percentile values of discharge quality, producing more accurate results than with a simple mass balance. The analytical method can be used on a programmable calculator, while the Monte Carlo method is versatile because it can cope with data that are not log-normal and with correlation between the variables. It is particularly useful in problems of pollution control by river flow augmentation. It gives approximate values for the mean and standard deviation of T even where the distributions assumed for its data are accurate. The analytical method gives accurate values of the mean and standard deviation of T provided the assumption of log-normal flows is accurate. Some advantage is obtained by using both methods to check the sensitivity of the results. (Titus-FRC)

AN AUTOMATED SYSTEM FOR MONITORING THE KINETICS OF BIOLOGICAL OXIDATION OF AMMONIA,
Consiglio Nazionale delle Ricerche, Rome (Italy). Inst. for Water Research.
R. Ramadori, A. Rozzi, and V. Tandoi.
Water Research, Vol 14, No 10, p 1555-1557, October, 1980. 2 Fig, 2 Tab, 2 Ref.

Descriptors: *Ammonia, *Chemical reactions, *Sludge treatment, Cultures, Testing procedures, *Nitrification, Time series analysis, Denitrification, Waste treatment, *Oxidation, Microorganisms, Equipment, Volumetric analysis, Spectrophotometry.

A technique is proposed for accurate determination of nitrifiying kinetics in cultures of Nitrosomonas bacteria. The temperature, dissolved oxygen content, ammonium concentration, pH and volume of the sample are established and the rate of nitrification is determined by monitoring the alkali consumption of the sample on a continuous data recorder. Concentrations of volatile suspended solids and ammonia, nitrite, and nitrate nitrogen are determined at the end of the test. The mass of oxidized ammonia is determined by spectrophotometry, by sodium hydroxide consumption, and by a nitrogen mass balance at the beginning and end of the test. The technique produces results in good agreement with conventional methods. It minimizes interpolation errors and avoids interference from other microorganisms. (Titus-FRC)

A REACTION CHAMBER FOR STUDY OF INTERACTIONS BETWEEN SEDIMENTS AND WATER UNDER CONDITIONS OF STATIC OR CONTINUOUS FLOW,
Army Engineer Waterways Experiment Station, Vicksburg, MS. Environmental Lab.
D. Gunnison, J. M. Brannon, I. Smith, Jr., G. A. Burton, and K. M. Preston.
Water Research, Vol 14, No 10, p 1529-1532, October, 1980. 2 Fig, 2 Tab, 9 Ref

Descriptors: *Sediment-water interfaces, *Lake sediments, *Reservoirs, *Organic loading, *Methodology, Continuous flow, Flooding, Flow, Sediments, Reservoir silting, Sediment distribution, Reservoir operation, Standing waters, Sediment transport, Reservoir construction.

A soil/sediment-water reaction chamber has been designed for use in studies to assess the impact of soil flooding upon the chemical composition of overlying waters. The chamber consists of a plexiglass column fitted with an air-trapping system and with provisions for continuous and variable flow of water, a circulation pump, and sampling ports. The variable flow rate allows a retention period of 17.4 to 347 days for water in the chamber. The chamber has been used in studies of the aging of flooded soil and of effects of organic loading on reservoir water quality. It has potential application to problems of reservoir creation and restoration and for developing rate coefficients for mathematical water quality models. Major advantages of this system are the large volume which minimizes the impact of removal of a large volume of sample, the large sediment-water contact area, and the ability to use the system in either a static or flow-through mode. (Titus-FRC)

THE EFFECT OF CONCENTRATION OF ADSORBING SOLIDS ON THE PARTITION COEFFICIENT,
Manhattan Coll., Bronx, NY. Dept. of Civil Engineering.
D. J. O'Connor, and J. P. Connolly.
Water Research, Vol 14, No 10, p 1517-1523, October, 1980. 7 Fig, 1 Tab, 21 Ref.

Descriptors: *Mathematical studies, *Laboratory tests, *Equilibrium, Hydrologic equations, *Adsorption, *Solids contact processes, Sediments, Soils, Sludge digestion, Heavy metals, Organic compounds, Reaction rates, Pesticide kinetics, Sorption, Soil properties.

Laboratory studies demonstrate an inverse relationship between the concentration of adsorbing solids and the partition coefficient in natural water systems. The partition coefficient is defined as the ratio between the solid-phase and dissolved concentrations, and it is a function of the solubility of the adsorbate and of the organic and clay fractions of the adsorbent. Different compounds adsorbing to the same solids have similar concentration dependences. For example, DDT, heptachlor and dieldrin adsorb to kaolinite, illite and montmorillonite, and cobalt and ruthenium adsorb to Lake Austin sediment at comparable slopes or concentration dependences. This is also true for Dimilin and Kepone adsorbing to Range Point sediment and for heavy metals adsorbing to digested sludge. These relationships have numerous implications to the distribution and retention of heavy metals and organic chemicals in natural water systems. (Titus-FRC)

KINETICS OF TRACE METAL PARTITIONING IN MODEL ANOXIC MARINE SEDIMENTS,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
S. M. Oakley, C. E. Delphey, K. J. Williamson, and P. O. Nelson.
Water Research, Vol 14, No 8, p 1067-1072, 1980. 6 Fig, 2 Tab, 12 Ref. OWRT A-051-ORE(1).

Descriptors: *Trace elements, *Metals, *Sediments, *Laboratory tests, *Kinetics, Heavy metals, Pollutants, Path of pollutants, Copper, Cadmium, Lead, Zinc, Chemical analysis, Sulfides, Water pollution, Water quality, Marine sediments.

A model anaerobic sediment consisting of humic acid, clay, ferrous sulfide, sand, and seawater was utilized to study the partitioning of Cu, Cd, Pb, and Zn between different geochemical phases. An extraction scheme was developed that was selective for each geochemical phase. Metals were dosed on one phase separately, and then mixed into the other undosed phrases. The kinetics of partitioning were rapid, regardless of which phase was initially dosed; equilibrium was reached within 2-5 days. The stoichiometry of distribution was also independent of the initially dosed phase. The final metal distributions showed that the metal sulfide phase was not necessarily the dominant trace metal sink in anaerobic sediments. (Sims-ISWS)

INTERACTIONS AND SURVIVAL OF ENTERIC VIRUSES IN SOIL MATERIALS,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering
M. D. Sobsey, C. H. Dean, M. E. Knuckles, and R. A. Wagner.
Applied and Environmental Microbiology, Vol 40, No 1, p 92-101, July, 1980. 10 Tab, 24 Ref. OWRT-A-090-NC(5), 14-34-0001-6034, 14-34-0001-7070.

Descriptors: *Viruses, *Soils, Earth, Clay loam, Enteric viruses, *Waste water treatment, *Adsorption, Soil materials, Viruses removal, *Soil types, Domestic wastes, Animal wastes(Wildlife), Landfills, Irrigation water.

There were marked differences in the abilities of eight different soil materials to remove and retain viruses from settled sewage, but for each soil material the behavior of two different viruses, poliovirus type 1 and reovirus type 3, was often similar. Virus adsorption to soil materials was rapid, the majority occurring within 15 min. Clayey materials efficiently adsorbed both viruses from waste water over a range of pH and total dissolved solids levels. Sands and organic soil materials were comparatively poor adsorbents, but in some cases their ability to adsorb viruses increased at low pH and with the addition of total dissolved solids or divalent cations. Viruses in suspensions of soil material in settled sewage survived for considerable time periods, despite microbial activity. In some cases virus survival was prolonged in suspensions of soil materials compared to soil-free controls. Although sandy and organic soil materials were poor virus adsorbents when suspended in waste water, they gave > or = 95% virus removal from intermittently applied waste water as unsaturated, 10-cm-deep columns. However, considerable quantities of the retained viruses were washed from the columns by simulated rainfall. Under the same conditions, clayey soil material removed > or = 99.9995% of the viruses from applied waste water, and none were washed from the columns by simulated rainfall.

TRANSLOCATION OF MERCURY AND MICROBIAL ADAPTATION IN A MODEL AQUATIC SYSTEM,
Ohio State Univ., Columbus. Dept. of Microbiology.
J. A. Titus, J. E. Parsons, and R. M. Pfister.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 3, p 456-464, September, 1980. 7 Fig, 34 Ref. OWRT-A-042-OHIO(2).

Descriptors: *Mercury, *Bacteria, *Sediments, *Adaptation, Model studies, Metals, Water pollution sources, Water pollution effects, Gastropods, Aquatic life, Fish, Toxins, Resistance, Lakes, Microbiology, Bottom sediments, Laboratory tests, Path of pollutants.

The movement of mercury through components of a 20-gal aquarium model aquatic system and changes in mercury-resistant levels of bacterial populations with increasing sediment mercury load were investigated. Metallic mercury (1 g HgO) was introduced into the mud layer of bed sediments in the model system via a glass tube. In the study of bacterial populations, 0.5 mg Hg(2+)/liter was added daily for 9 wk to the model system, after which it was increased to 5.0 mg Hg(2+)/liter. In less than 7 wk, mercury was found in all test sites of the aquarium. Mercury moved through the sediment with an increasing rate. Levels of mercury in tank water were undetected until the sediment had been traversed. Mercury was accumulated 1,000-fold over levels in tank water in two gastropods. Fish also bioaccumulated mercury. It was thought that the bacterial populations may have been altered in their sensitivity to mercury due to the rapid passage of mercury throughout the bottom sediments. After 5 wk, the mercury content of the sediment reached 0.25 microgram Hg/g. Little change occurred in the total viable count (TVC) at the beginning of the experiment, but a large increase was found in the percentage of the TVC that was resistant to 6 micrograms Hg(2+)/ml at 3 wk. At wk 9, when mercury flow rate was increased to 10 mg Hg(2+)/day, mercury content of sediments rose, while TVC values declined slightly, and percentage of TVC resistant to 6 micrograms Hg(2+)/milliliter rose from about 1% to 10% (falling to 5% after 16 wk). AVAILABILITY AND QUALITY OF GROUNDWATER, SOUTHERN UTE INDIAN RESERVATION, SOUTHWESTERN COLORADO,
Geological Survey, Lakewood, CO. Water Resources Div.
R. E. Brogden, E. C. Hutchinson, and D. E. Hillier.
Available from Supt. of Documents, GPO, Washington, DC 20402, Price, $1.75. Geological Survey Water-Supply Paper 1576-J, 1979. 28 p, 4 Fig, 1 Plate, 5 Tab, 11 Ref.

Descriptors: *Groundwater availability, *Water quality, *Water chemistry, *Aquifer characteristics, *Colorado, Hydrogeology, Water wells, Water supply, Water yield, Potable water, Water quality standards, *Southern Ute Indian Reservation(CO).

Population growth and the potential development of subsurface mineral resources have increased the need for good quality groundwater on the Southern Ute Indian Reservation in southwestern Colorado. A study was conducted during 1974-76 to assess the groundwater resources of the reservation. Water occurs in aquifers in the Dakota Sandstone, Mancos Shale, Mesaverde Group, Lewis Shale, Pictured Cliffs Sandstone, Fruitland Formation, Kirtland Shale, Animas and San Jose Formations, and terrace and flood-plain deposits. Well yields from sandstone and shale aquifers are small, generally in the range from 1 to 10 gal/min (gallons per minute), with maximum reported yields of 75 gal/min. Well yields from terrace deposits generally range from 5 to 10 gal/min with maximum yields of 50 gal/min. Well yields from flood-plain deposits are as much as 25 gal/min. Water quality in aquifers depends in part on rock type. Water from sandstone, terrace, and flood-plain aquifers is predominantly a calcium bicarbonate type, whereas water from shale aquifers is predominantly a sodium bicarbonate type. Water from rocks containing interbeds of coal or carbonaceous shales may be either a calcium or sodium sulfate type. Dissolved-solids concentrations of groundwater range from 115 to 7,130 mg/L. Water from bedrock aquifers is the most highly mineralized, while water from terrace and flood-plain aquifers is the least mineralized. In many water samples collected from bedrock, terrace, and flood-plain aquifers, the concentrations of arsenic, chloride, dissolved solids, fluoride, iron, manganese, nitrate, selenium, and sulfate exceeded U.S. Public Health Service (1962) recommended limits for drinking water. Selenium in the ground water in excess of the recommended limit of 10 micrograms per liter for drinking water occurs throughout the reservation but principally in the central part. (USGS)

5C. Effects Of Pollution

THE ROLE OF CORTISOL IN STRESS-INDUCED METABOLIC CHANGES IN FUNDULUS HETEROCLITUS,
Delaware Univ., Newark. School of Life and Health Sciences.
G. J. Leach, and M. H. Taylor.
General and Comparative Endocrinology, Vol 42, p 219-227, 1980. 2 Fig, 2 Tab, 39 Ref. OWRT-A-043-DEL(5).

Descriptors: *Stress analysis, *Metabolism, *Teleosts, *Fish, *Environmental effects, Fish passages, Fish migration, Analysis, Analytical techniques, Strain, Animal metabolism, Proteins, Biochemistry, Aquatic life, Aquatic animals, Fish diseases, Fish behavior, Analyical techniques, Research and development, Testing, Evaluation, Measurement.

Adult Fundulus heteroclitus fish were obtained from salt marsh tidal creeks on the lower Delaware Bay and acclimated to laboratory conditions prior to experimentation. Studies were conducted to determine if the metabolic changes reported earlier for cortisol treatment also occurred in response to endogenous cortisol elevations. Cortisol and relevant metabolic parameters were measured in fish exposed to restraint stress. Metyrapone (MP) treatment was used to isolate metabolic responses specifically attributable to the cortisol elevation. The test fish responded to a number of nonspecific stress stimuli, with transient elevations in serum cortisol levels. MP treatment suppressed stress-stimulated peaks, but did not alter resting cortisol levels. MP also elevated serum '11-deoxycortisol' levels. Fasted fish exposed to restraint stress in a 30 hour stress experiment exhibited marked hyperglycemia, while MP-treated fish exposed to the same stress showed initial hyperglycemia but not the sustained peak seen in untreated fish. Liver glycogen in stressed fish was somewhat higher than in MP-treated stressed fish. No significant changes were noted in stressed fish for muscle glycogen, serum protein, or amino acid content of serum, liver, or muscle. It was concluded that during stress in this species, cortisol appears to act to sustain the elevation in serum glucose. (Zielinski-IPA)

INFLUENCE OF COAL HUMIC ACID ON THE GROWTH OF CHLORELLA VULGARIS ALGAE,
Missouri Univ.-Columbia. Dept. of Chemistry.
S. L. Hoeffner, and S. E. Manahan.
Journal of Environmental Science and Health, Vol A15, No 2, p 149-161, 1980. 2 Fig, 2 Tab, 11 Ref. OWRT-B-145-MO(1).

Descriptors: *Algae, *Chlorella, *Humic acids, *Coals, Water pollution, *Mine acids, *Water pollution effects, Waste water(Pollution), Slurries, Coal mines, Hydraulic mining, Effects, Eutrophication, Research and development, Testing, Assay, Chelation, Chemical reactions, Pollutants, Pollutant identification, Measurement, Evaluation, Estimating.

The effects of coal humic acid leached from coal under coal slurry pipeline conditions and related circumstances on the growth of algae and on potential eutrophication of waters exposed to coal humic substances were studied. Coal humic acid was prepared by partial oxidation of Wyoming subbituminous coal with hydrogen peroxide in a basic medium. Algae (Chlorella vulgaris) were grown in media containing 1.2 mg/liter EDTA, or 75 mg/liter coal humic acid, or in media in which the amount of chelating agent (EDTA) or coal humic acid were varied. At lower levels humic acid was found to stimulate algae growth. Optimum growth was obtained at 75 mg/liter of coal humic acid for algae acclimated to coal humic acid and 55 mg/liter for non-acclimated algae. Low concentrations of EDTA gave erratic results. Growth of algae at very low concentrations of coal humic acid was similar to that seen in the absence of added chelating agent, with the latter cultures often growing faster in later stages of growth. It was suggested that algae excrete a chelating substance that only functions in the absence of added chelating agent. The study indicated that coal humic acid affects algae growth similar to humic acids from more natural sources. (Zielinski-IPA)

CHANGES IN NUTRIENT ION LEVEL OF SUBSTRATES AND STREAM WATER DUE TO LAND MANAGEMENT IN NORTHUMBERLAND,
Northumberland Coll. of Education, Newcastle-upon-Tyne (England). Dept. of Environmental Science.
J. E. Hobrough, and S. Frost.
Environmental Pollution (Series A), Vol 23, No 2, p 81-93, October, 1980. 4 Fig, 4 Tab, 25 Ref.

Descriptors: *Nutrients, *Agricultural watersheds, *Water analysis, Nitrites, Nitrates, Phosphorus, Feed lots, Fertilizers, Water quality, Water pollution sources, Sediments, United Kingdom.

Changes in water chemistry due to watershed land use in Northumberland were attributed to the use of Rumevite feeding licks in sheep pens. The resulting animal droppings and spillage from the licks and feed bags made their way into the streams. Water samples and sediment samples from the streams and the River Pont were analyzed for ammonia, nitrite, nitrate, phosphate, potassium, sodium, calcium, and pH. The streams also received drainage from agricultural lands and

sewage and urban runoff. Comparisons of the chemical composition of substrates and flowing water revealed significant differences in concentration between water and the stream bed. Further biological evaluation is suggested to determine the effects of the pollution on the flora and fauna of the systems. (Small-FRC)

LONG TERM EFFECT OF SEWAGE SLUDGE ADDITIONS ON POPULATIONS OF NOCARDIA ASTEROIDES, MICROMONOSPORA AND THERMOACTINOMYCES IN SOIL,
Department of Scientific and Industrial Research, Lower Hutt (New Zealand). Soil Bureau.
V. A. Orchard.
Soil Biology and Biochemistry, Vol 12, No 5, p 477-481, 1980. 5 Fig, 21 Ref.

Descriptors: *Sewage sludge, *Environmental effects, *Populations, *Soil fungi, Sludge disposal, Soil microorganisms, Actinomycetes, Landfills, Plant growth, Nutrients, On-site tests, Pathogenic fungi, Public health.

The effects of applications of both wet and dried sludge to soil populations of Nocardia asteroides, Micromonospora spp, and Thermoactinomyces spp were examined in plot experiments. The amount of herbage harvested from the plots over the three year test period was also determined to evaluate the relationship between increased dry matter and sludge decomposition. A sustained zymogenous-like response was observed in Micromonospora when the complex recalcitrant organic substrates that occur in dried sludge were applied to the soil. Wet sludge, which contains less organic material, had no effect on populations of Nocardia and Micromonospora when added to the soil. Contrastingly, greater numbers of Thermoactinomyces were isolated from wet, rather than dry sludge plots. Evaluations of herbage produced during the three year study indicated that plant nutrients were continually mineralized after addition of sewage sludge. (Geiger-FRC)

LAND USE. PIGS IN POKES: PORK BARREL WATER PROJECTS,
League of Women Voters, Rochester, NY.
J. Wellers, and O. Berg.
Environment, Vol 22, No 8, p 5, 42-43, October, 1980. 3 Ref.

Descriptors: *Lakes, *Recreation facilities, *Land use, Legislation, Water pollution, Water resources, Non-consumptive use, Recreation demand, Lake Ontario, Esthetics, New York, Future planning, Canal construction, Environmental effects.

An overview is given of the situation existing between the Army Corps of Engineers and the inland lake, Irondequoit Bay, which is separated from Lake Ontario by a thin natural sand bar. This recreational lake in New York state has long been under consideration as a site for harboring and launching yachts and other craft. The Corps has proposed a project which would build a canal to connect the smaller lake to Lake Ontario by cutting through the sand bar and also construct a bridge over the waterway. Such alterations may endanger the fragile glacial sand slopes that provide aesthetic value to the lake which, at the present, supports only facilities for small boats. Added pollution of lake water from use by larger vessels is also feared, although supporters of the proposed project argue that a mixing of the already polluted lake waters with those of the Great Lakes may help to ease the existing pollution situation. Twenty years of formal discussion on the project have taken place, but special interest groups have always managed to block initiation of the work on the grounds of how the sand bar is to be opened rather than whether or not to open it. Although cost-benefit analyses apparently indicate a profit to local government if the project is executed, local residents still wish to block the construction of the artificial waterway to protect their homes and property. Pure water projects have alleviated problems of high salt deposits in the lake from local pollution. Criticisms of federal actions in such cases as that described for Irondequoit Bay (which is still unsettled) are based on the government's seeming indifference to the consequences of the project on the environment. SOME PROBLEMS OF AQUATIC ENVIRONMENTS IN EGYPT FROM A GENERAL VIEWPOINT OF NILE ECOLOGY,
Freshwater Biological Association, Ambleside, (England).
J. F. Talling.
Water Supply and Management, Vol 4, No 1-2, p 13-20, 1980. 59 Ref.

Descriptors: *Nile River, *Reviews, *Aquatic environments, Phytoplankton, River systems, Water pollution, Salinity, Systematics, Lakes, Limnology, Nutrients, Water pollution sources, Path of pollutants, Conductivity, Fluctuations, Egypt.

Some ecological problems of the Nile River are reviewed with a focus on their origin at points upstream. Population sequences obtained by longitudinal surveys in upstream basins could greatly enhance the knowledge of temporal sequences observed downstream. Some examples of combined longitudinal and seasonal surveys from Sudan and Egypt are mentioned. The effects of over-year water storage in Lake Nasser-Nubia upon the periodicity of nutrients, phytoplankton growth and sediment patterns downstream are also considered. More basic limnological studies of Lake Nasser-Nubia are needed to learn more about its nutrients, diurnal changes, populations, and biological and chemical properties. The problems of salinity, nutrient enrichment and pollution effects are addressed in relation to their possible origins from areas upstream. More studies are also needed on changes in chemical and physical properties of the river water. Accurate taxonomic identifications are also vital to studies along the Nile, and some examples of the occurrence of species of the diatom Melosira are included. (Geiger-FRC)

EFFECTS OF HEAVY METALS IN COMBINATION WITH NTA, HUMIC ACID, AND SUSPENDED SEDIMENT ON NATURAL PHYTOPLANKTON PHOTOSYNTHESIS,
Oslo Univ. (Norway).
D. Hongve, O. K. Skogheim, A. Hindar, and H. Abrahamsen.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 4, p 594-600, October, 1980. 1 Fig, 1 Tab, 20 Ref.

Descriptors: *Water pollution effects, *Metals, Phytoplankton, *Heavy metals, Nitrilotriacetic acid, Pollutants, Water pollution, Lead, Mercury, Cadmium, Copper, Zinc, Aquatic life, Phytotoxicity, Photosynthesis.

The acute effects of copper, cadmium, lead, zinc, and mercury on a natural phytoplankton community were evaluated separately and in combination in Lake Tyrifjorden under different experimental circumstances. The addition of suspended sediment alone to lake water increased photosynthesis about 19%. The four experimental series conducted included natural water + metals; natural water + metals + sediment; natural water + metals + humus; and natural water + metals + NTA (nitrilotriacetic acid). The first experiment indicated that the order of metal toxicity toward natural phytoplankton was: Hg, Cu, Cd, Pb, and Zn, in decreasing order. The effect of heavy metals in water enriched with natural sediment was to reduce the photosynthesis, but the reduction was less than in control water without sediment. The metals, both individually and in combination, inhibited photosynthesis of phytoplankton. The toxicity arising from metal mixtures was an obvious result of synergism. A moderate increase in turbidity of the water reduced biological availability of the metals, thus reducing their inhibitory effect on the rate of photosynthesis. NTA led to detoxification of all tested concentrations of Cu and Cd. Zn and Pb were also detoxified at concentrations less than 10 sup-5M. The metal-NTA complex was more toxic than ionic forms of the metal in the case of mercury. It is noted that the addition of NTA to Lake Tyrifjorden will give directly, without microbiological methylation, a substance which may affect the plankton photosynthesis at a concentration which is only slightly higher than the present concentration of mercury in the lake. SEASONAL AND SPECIES-DEPENDENT VARIABILITY IN THE BIOLOGICAL IMPACT OF MINE WASTES IN AN ALPINE RIVER,
Alberta Environmental Center, Vegreville.
J. W. Moore.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 4, p 524-529, October, 1980. 1 Fig, 1 Tab, 10 Ref

Descriptors: *Mine wastes, *Algae, *Aquatic life, *Environmental effects, Flat River(Alberta), Water pollution effects, Pollutants, Copper, Cyanide, Invertebrates, Tungsten mine, Insects, Mining, Northwest territories, Alberta.

The effects of mine wastes on aquatic communities varied significantly with species and season. Samples of invertebrates, algae, sediments, and water were collected near a tungsten mine in the Flat River, Canadian Northwest Territory, upstream and at nine stations 0 to 30 kilometers downstream from this area. Analysis of river water showed that concentrations of copper, manganese, beryllium, iron, cobalt, and cyanide increased sharply near the mine compared with control areas. Concentrations of arsenic, lead, zinc, cadmium, and mercury were low throughout the river. Total hardness and pH showed little variation at stations sampled. Heavy metals were generally below detectable limits. Total phosphorus and nitrate concentrations increased at certain stations due to sewage input. The 107 species of algae detected and counted varied inconsistently with location in the river, but were greater near the mine in December. Of 29 species of benthic invertebrates studied, the predominant chironomids were restricted to stations below the mine. Mayflies decreased near the mine. Other species did not show a consistent pattern among the stations. Species composition during December differed considerably from summer populations, invertebrate species densities being higher in December, probably because cold temperatures reduced the toxicity of copper and cyanide. REHABILITATION OF THE INNER THAMES ESTUARY,

Thames Water Authority, London (England).
M. J. Andrews, and D. G. Rickard.
Marine Pollution Bulletin, Vol 11, No 11, p 327-331, November, 1980. 6 Fig, 17 Ref.

Descriptors: *Reclamation, *Estuaries, *Fish, Shrimp, Fecundity, Density, Habitat improvement, Ducks, *Thames River, United Kingdom.

The recolonization of the inner Thames estuary during 1976-80 was characterized by increases in population size, animal fecundity, and species diversity. The number of species recorded in the inner estuary increased almost linearly with time until 1976, when all fresh water and euryhaline fish species indigenous to the Thames system had been collected as well as 95% of the marine species prevalent in the southern North Sea. The changing status of many fish species has caused alterations in population structure. Macroinvertebrate studies since 1974 have shown a shift from an assemblage dominated by tubificid worms to a more stable multi-specied community. Organisms recently found included oligochaete worms, polychaete worms, amphipods, isopods, molluscs and crustaceans. Thousands of gravid shrimp and gravid prawn have been observed in the inner Thames. In 1967-70, only one berried shrimp was found among more than 40,000 examined. Algal and waterfowl populations have also recovered to some extent. The influx of organisms beginning in 1964 was related to improved water quality and the return to aerobicity in the summer months following the rebuilding of the Crossness sewage treatment works. The second phase followed the commissioning of extensions to London's other main sewage treatment works at Beckton. (Small-FRC)

Environmental Pollution (Series A), Vol 23, No 2, p 131-152, October, 1980. 4 Fig, 10 Tab, 73 Ref.

Descriptors: *Zooplankton, *Lakes, *Eutrophication, *Reclamation, Phytoplankton, Lake stages, Primary productivity, Water pollution effects, New York, Onondaga Lake, Fish, Reviews.

A comprehensive zooplankton study of polluted hypereutrophic Onondaga Lake in New York State was conducted in 1978. Changes in the zooplankton community since an original investigation in 1969 were determined. Re-establishment of the alewife, a size-selective planktivore, probably caused the reduction in large daphnids, in spite of the overall increase in zooplankton biomass and concentration since 1969. The alewife probably had a significant influence, based on the small sizes of dominant microcrustaceans and their probable high turnover rates in such a eutrophic system. The most dramatic change in the lake, the ten- to twenty-fold increase in biomass, may be the result of reclamation efforts which have caused changes in the phytoplankton population. Zooplankton-phytoplankton interactions may delay or resist further reclamation efforts aimed at primary productivity. (Small-FRC)

GAS CHROMATOGRAPHY COMBINED WITH MASS SPECTROMETRY FOR THE IDENTIFICATION OF ORGANIC SULFUR COMPOUNDS IN SHELLFISH AND FISH,
Okayama Univ. (Japan). Dept. of Public Hygiene.
M. Ogata, and Y. Miyake.
Journal of Chromatographic Science, Vol 18, No 11, p 594-605, November, 1980. 12 Fig, 4 Tab, 11 Ref.

Descriptors: *Oil, *Clams, *Mass spectrometry, *Gas chromatography, Laboratory tests, Fish, Analytical techniques, Sulfur compounds, Water pollution effects, Crude oil.

Organic sulfur compounds contained in crude oils can be used as markers of oil pollution in shellfish and fish. Eels and short-necked clams were maintained in the laboratory in water containing crude oil. Mass spectra and mass chromatograms of short-necked clam extract indicated the presence of organic sulfur compounds of alkyl- (C1 to C10) benzothiophenes, dibenzothiophene, alkyl- (C1 to C8) dibenzothiophene, naphthalene, and alkyl- (C1 to C6) naphthalene. Capillary column gas chromatography-mass chromatograms of crude oil and short-necked clam extract indicated the presence of alkyl benzothiophene (C2-C6), dibenzothiophene, and alkyl dibenzothiophene (C1-Cr). A new intensity matching method was devised for the identification of sulfur compounds by capillary gas chromatography/mass spectrometry. (Small-FRC)

PREDATOR-PREY RELATIONS IMPORTANT FOR THE BIOTIC CHANGES IN ACIDIFIED LAKES,
Goeteborg Univ. (Sweden). Dept. of Zoology.
M. O. G. Eriksson, L. Henrikson, B-I. Nilsson, G. Nyman, and H. G. Oscarson.
Ambio, Vol 9, No 5, p 248-249, 1980. 1 Fig, 36 Ref.

Descriptors: *Reviews, *Acidic water, *Lakes, *Predation, Fish, Phytoplankton, Aquatic populations, Distribution patterns, Water pollution effects, Sweden.

A literature review is presented of the altered prey-predator interaction in acidified lakes after the decline or disappearance of fish. When fish were experimentally removed from Lilla Stockelidsvatten, a non-acidified lake, changes in the biotic community were similar to those noted in acidified lakes after the elimination of the fish population. Larger net phytoplankton became more abundant, and small cladocerans were replaced by larger calanids. Small sized, selective predators such as corixids, Chaoborus larvae, and other insects usually preyed on by fish replace fish as the primary predators. Thus, many population structural changes reported in acidified lakes are due to the altered predator-prey interaction. (Small-FRC)

THE AQUATIC VEGETATION OF LLANGORSE LAKE, WALES,
University of Wales Inst. of Science and Technology, Cardiff. Dept. of Applied Biology.
B. A. Cragg, J. C. Fry, Z. Bacchus, and S. S. Thurley.
Aquatic Botany, Vol 8, No 2, p 187-196, April, 1980. 3 Fig, 1 Tab, 21 Ref.

Descriptors: *Lakes, *Eutrophication, *Aquatic plants, *Turbulence, Surveys, Water pollution effects, Recreation, Vegetation effects, Aquatic populations, Sewage effluents, Nutrients, Aquatic algae, Agricultural runoff, Fertilizers, Mapping, Lake morphometry, Hydrography, *Great Britain, Llangorse Lake(Wales).

A survey was conducted of the aquatic vegetation of Llangorse Lake, which receives treated effluents from the Llangorse Village Sewage Plant and is heavily used for recreational purposes. The status of submerged, emergent, and marginal vegetation was evaluated in this lake, which is situated in the Brecon Beacons National Park in Wales. Results were compared with previous studies on lake flora to assess changes that might have occurred over the years. A marked decline was noted in the diversity of submerged macrophytic flora (dominated by Potamogeton pectinatus and Zannichellia palustris), from eight species in 1973 to only monospecific stands of Z. palustris in 1977. Macrophyte decline was attributed to cultured eutrophication processes along with mechanical disturbances such as boat turbulence. Agricultural runoff contributed many nutrients due to increased use of nitrogenous fertilizers in the catchment area. SYMAP computer mapping was also carried out to produce outlines of the submerged contours. (Geiger-FRC)

ANALYSIS OF THERMAL IMPACT IN TIDAL RIVERS AND ESTUARIES,
Giessen Univ. (Germany, F.R.). Physikalisches Inst.
J. Hauser, D. Eppel, and F. Tanzer.
Water Research, Vol 14, No 10, p 1409-1419, October, 1980. 10 Fig, 7 Ref.

Descriptors: *Temperature, *Model studies, Computer simulation, *Flow, *Turbulence, Velocity, *Tidal streams, Thermal properties, Thermodynamic behavior, Mathematical studies, Estuaries, Poisson rates, Shores.

A mathematical model has been developed to simulate thermal distributions in esturarine areas with severe reversing flow conditions. The model accounts for surface heat transfer, turbulent effects, vertical variations in velocity and temperature, and the three-dimensional geometry of the flow region. Four main algorithms are employed: (1) specification of the boundary, (2) determination of all discrete element midpoints within the solution area, (3) construction of discrete elements of irregular geometry matching the curved boundary, and (4) treatment of boundary conditions and numerical solution of the mathematical system of weakly coupled ordinary differential equations derived from the conservation principles for mass and thermal energy. Preliminary results of the simulation were compared with available data for a section of the Elbe River. Although no quantitative agreement was achieved, comparisons with aerial survey data showed qualitative agreement with the dimensions and behavior of the thermal plume located downstream of the power plant. The model has potential application in predicting thermal plume behavior in power plant designs and in analyses of thermal water pollution. (Titus-FRC)

T. R. White, and R. C. Fox.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-150252, Price codes: A07 in paper copy, A01 in microfiche. Water Resources Research Institute, Clemson University, Technical Report 87 (Vol I), May, 1980. 120 p, 17 Fig, 14 Tab, 82 Ref. OWRT-A-037-SC(2), 14-34-0001-9043, 14-34-0001-8043, 14-34-0001-7086, 14-34-0001-6042.

Descriptors: *Channeling, *Streamflow, *Drainage effects, *Aquatic insects, *Sampling, Cores, Laboratory tests, Streams, Channel flow, Channels, Regulation flow, Flow, Channel improvement, Stream stabilization, South Carolina, Aquatic life, Aquatic animals, Insects, Coastal plains, Bodies of water, Regions, Research and development.

Recovery, defined as development of an aquatic insect fauna similar to that of the control streams, does not occur in South Carolina streams following channelization. Five channelized streams and two natural streams were sampled over the 1975-1979 period to determine channelization effects on species composition and diversity of aquatic insects in the Piedmont/Coastal Plain regions. Study of stream samples revealed that channelization yields a fauna composed principally of very tolerant or normally pond inhabitating species. Taxa preferring fast currents, vegetation, and low turbidity were rarely found in the channelized streams. Surber square foot and core samplings afforded greatest utility for characterizing stream aquatic insect diversity; kickscreen sampling was found preferable in determining population composition. The results supported the contention that, if a creek must be altered, it should be by means other than classical channelization for best running water insect faunal preservation. Recommendations to minimize impacts were developed for cases in which a stream must be altered and no alternative exists. (Zielinski-IPA)

THE TRUCKEE BASIN FISHERY, 1844-1944,
Nevada Historical Society, Reno.
J. M. Townley.

Available from the National Technical Information Service, Springfield, VA 22161 as PB81-150278, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Center, University of Nevada, Reno, Desert Research Institute Publication 43008, November, 1980. 88 p, 4 Tab. OWRT-A-096-NEV(1), 14-34-0001-0130.

Descriptors: *History, *Fisheries, *Basins, *Legal aspects, *Water pollution effects, Rivers, Riparian rights, River basin development, Biographies, Planning, Lake fisheries, Stream fisheries, *Nevada, River basins, Institutional constraints, Administration, Water policy, Dams, Bodies of water, Fishing, Water utilization, Legislation, *Truckee River basin(NV).

This second cooperative report of the Nevada Historical Society and the Water Resources Center at the Desert Research Institute builds upon the previous research concerning historical developments in the Truckee River System. A description of the fishery of the Truckee River has been provided from the discovery of the river in 1844 by Fremont, through the next century. Truckee River Fishery importance is evidenced today by litigation and administrative rules that affect the basin water users. The fishery has been discussed in perspective with other historical developments. The chronology of the fishery has been discussed in four principal sections (19th century developments; the Pyramid Lake Fishery before 1900; pulp, paper and pollution; and 1900-1944) using augmentation by 197 footnotes, with predominant references to Nevada statutes and historical issues of the Nevada State Journal and the Reno Evening Gazette. Development of dams and their impacts were discussed, the impacts of industrial pollution and Indian and sport fishing led to trout extinction and decline of the Fishery by 1944. (Zielinski-IPA)

ASIATIC CLAM INVASION: CAUSES AND EFFECTS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Biology.
D. S. Cherry, J. Cairns, Jr., and R. L. Graney.
Water Spectrum, Vol 12, No 4, p 18-24, Fall, 1980. 8 Fig. OWRT-B-101-VA(3).

Descriptors: *Asiatic clam, Toxicity, Bioassay, Biofouling, *Clams, *Clogging, *Intakes, *Power plants, Water temperature, Corbicula, Bioconcentration, Population, Density, New River(VA).

The introduction and subsequent invasion of the Asiatic clam (Corbicula fluminea) in the United States presents a new problem of infestation in power plant intake systems that conventional intermittent chlorination antifouling procedures may not resolve. This article discusses the dynamics of population increases of this organism and presents a case history at the Glen Lyn power plant in southwestern Virginia, where no clams were found before 1975, followed by a rapid population growth in subsequent years. Potential control measures are described with recommendations for future consequences to the power plant industry.

WATER QUALITY OF THE COLUMBIA RIVER,
Environmental Protection Agency, Seattle, WA. Water Div.
D. L. Petke.
In: Conflicts Over the Columbia River, Seminar conducted by Water Resources Research Institute, Oregon State University, Corvallis, Spring Quarter 1980. Report SEMIN WR 028-80. July 1980. p 65-68.

Descriptors: *Columbia River, *Hydroelectric plants, *Water quality control, *Water temperature, Irrigation water, Return flow, Salmonids, Federal Water Pollution Control Act, Oil spills, Pulp wastes, Bacteria.

The Columbia River has experienced some water quality problems over the years which have limited its use for various purposes. Irrigated agriculture and the construction and operation of multi-purpose and hydro-electric power dams have affected water quality. Industrial development has also produced subtle, long-term water quality changes. In the 1940's and 1950's a significant problem was a slow rise in the overall temperature regimen. The first major problem affecting users was the development of slimes associated with the sheath bacterium Sphaerotilus which coated fishermen's nets and lines. State and federal actions, including the Federal Water Pollution Control Act of 1967 helped solve this problem in the early 1970's. In the 1960's, municipal and industrial waste discharges produced unsafe bacteriological levels; however, this is now controlled, as is a condition known as 'dissolved gas supersaturation' which resulted in losses of 80-90% of downstream migrating salmon. Elevated, almost lethal, water temperatures are still a pervasive problem caused by: (1) dam construction which increases surface area, slows the river flow and produces temperature stratification; (2) point source heat discharges, such as from nuclear power plants; (3) irrigation withdrawals and return flows; and (4) deforestation. To a lesser degree, the water is affected by spills of oil and other hazardous materials. Recent environmental legislation is working toward minimizing these environmental impacts but continued vigilance by the public is also necessary. (Atkins-Omniplan)

5D. Waste Treatment Processes

DESIGN AND SPECIFICATIONS OF A 500 GALLON PER DAY SECONDARY REFRIGERANT FREEZE CONCENTRATION PILOT PLANT TO TREAT AQUEOUS-ORGANIC INDUSTRIAL STREAMS, PHASE 1,
Rohm and Haas Co., Bristol, PA. Engineering Div.
R. W. Carter
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-147837. Final Report to the Office of Water Research and Technology, June 1980. 89 p, 55 Fig, 3 Tab, 2 Ref [illegible] PB81-148566

Descriptors: *Waste water treatment, *Pilot plants, *Organic acids, *Separation techniques, *Freezing, *Engineering, Water purification, Equipment, Design, Model studies, Mechanical engineering, Instrumentation, Technology, Economics, Energy, Costs, Ice, Concentration, Butane.

The complete design specifications for a freeze concentration treatment pilot plant proposed by Rohm and Haas are presented. Freeze concentration purification of waste water by 'freezing out' the fresh water as ice can be more economical than distillation, incineration, or biological treatment. Rohm and Haas chose to investigate the purification of a dilute aqueous stream containing 1.5% acetic acid, 0.5% formaldehyde, and 1.0% other organic acids. The pilot plant is a two-stage, secondary refrigerant, direct contact freezing process with indirect melting and is an energy integrated system. The acetic acid solution is frozen by sparged liquid butane vapor and since acetic acid and water form a simple eutectic, the water freezes out of the solution as pure ice. The ice is separated out and melted using the heat from the condensing butane. The pilot plant was designed to produce 500 gallons per day of fresh water from waste water containing 3% organic waste with a capacity to expand to 750 gallons per day of fresh water from a 50% acetic acid solution. The pilot plant length is 37 feet and the estimated cost of a trimmed pilot plant is $480,981. The materials balance, engineering drawings and instrument specifications, cost estimates, and construction of a scale model have been completed. (Sidney-IPA)

CHEMICAL DOSAGE CONTROL FOR PHOSPHORUS REMOVAL.
Pollutech Pollution Advisory Services Ltd., Oakville (Ontario).
Environmental Protection Service, Ottawa, Ontario, Canada, Training and Technology Transfer Division (Water). Canada-Ontario Agreement on Great Lakes Water Quality Research Report No 4, 1976. 80 p, 43 Fig, 6 Tab, 7 Ref, 3 Append.

Descriptors: *Phosphorus removal, *Waste treatment, *Monitoring procedures, *Chemical dosage controls, Jar-test studies, Full-scale treatment, Data collections, *Great Lakes, Water quality.

This project was undertaken to determine whether a simple monitoring procedure could be utilized to control chemical addition in municipal waste treatment plants. It was intended to demonstrate that proportional control of chemical feeding would be economically advantageous and to determine which specific parameters could be monitored to enable chemical dosage control and at which locations within a treatment plant. A review of all available information on chemical dosage control programs underway in the United States was made, and data from the Ontario Ministry of the Environment based on observations as treatment plants were analysed in detail. No data were found upon which chemical dosages and phosphorus residuals could be compared with other related wastewater parameters. Bench-scale jar studies and measurements at a full-scale plant during chemical addition were therefore conducted to obtain the necessary data. (WATDOC)

BORON RECOVERY BY REVERSE OSMOSIS,
Westinghouse Research and Development Center, Pittsburgh, PA.
I. K. Bansal.
Industrial Wastes, Vol 26, No 6, p 12-13, 24, 26, 31, November/December, 1980. 6 Fig, 4 Tab, 1 Ref

Descriptors: *Reverse osmosis, *Nuclear reactors, *Boron, Ion exchange, Waste water treatment, Water purification, Ions, Treatment facilities.

Chemical coagulation, reverse osmosis, and ion exchange processes were evaluated for the removal of contaminants, primarily silica, chloride, calcium, magnesium, and sodium. Up to 67% of the boric acid was recovered from water leaked from the primary loop of an operating nuclear pressurized water reactor system using a combination of reverse osmosis and ion exchange. The volume of contaminating ions was reduced 98%. A proposed system includes filtration, a three stage reverse osmosis membrane system, and final polishing by a single-stage dual bed ion exchange. The final efflu-

ent can be concentrated in a boron evaporator to a level of 4% boric acid. (Small-FRC)

PLATING WASTE TREATMENT,
T. V. Belmont, and J. G. Cunniff.
Industrial Wastes, Vol 26, No 6, p 14, 27, November/December, 1980. 1 Fig, 1 Tab.

Descriptors: *Industrial wastes, *Metals, *Waste water treatment, Copper, Recycling, Treatment facilities, Costs, Metal plating industry, Cyanide.

The waste treatment facilities at the General Metal Finishing Company plant in Attleboro, Massachusetts, are described. Cyanide-bearing rinse waters drain by gravity into a sump after copper, silver, and cyanide reverse cleaners. The rinse waters are mixed in a Cyanide I reaction vessel with various treatment chemicals including 20-25% solutions of sodium hydroxide and hypochlorite. The rinse waters then flow to Cyanide II where the pH is lowered to 7.5-8.5 with sulfuric acid. The clarified effluent is discharged into a sewer. The sludge is disposed of by a licensed waste hauler. The treatment plant cost $208,000 (1978), and the recovery of metals provides an income of approximately $50,000 per year. (Small-FRC)

SEWAGE: WASTE OR RESOURCE,
Wisconsin Univ.-Madison.
C. Hamlin.
Environment, Vol 22, No 8, p 16-20, 38-42, October, 1980. 4 Fig, 27 Ref.

Descriptors: *Sewage treatment, *Sludge disposal, *Recycling, Toxicity, History, Pathogenic bacteria.

While some cities recycle de-watered sludge as fertilizer, there are hygienic and toxicity problems with some sewage wastes. Raw sewage contains pathogenic bacteria, most of which are killed by treatment or exposure to sunlight and air. Industrial wastes add heavy metals and other toxins to sewage, and this threat must be controlled either by eliminating industrial wastes or monitoring plant uptake of the toxins. The problem of rivers polluted by discharged sewage was not solved by any of the early sewage recycling processes such as the ABC method, and the European sewage farms ended with the advent of nitrate fertilizers. Today, knowledge is available for treating sewage, but modern man has forgotten that sewage is a resource and should be returned to the land. (Small-FRC)

DIFFERENT METHODS TO EXTRACT SEWAGE SLUDGE FOR THE CULTIVATION OF CHLORELLA PYRENOIDOSA,
Chinese Univ. of Hong Kong, Shatin. Dept. of Biology.
M. H. Wong.
Archiv fur Hydrobiologie, Vol 88, No 4, p 426-438, June, 1980. 6 Fig, 4 Tab, 25 Ref.

Descriptors: *Separation techniques, *Sewage sludge, *Chlorophyta, Activated sludge, Nutrients, Nitrogen, Phosphates, Aquatic algae, Proteins, Laboratory tests.

Three different techniques were examined for extracting sewage sludge for the purpose of cultivating the unicellular green algae, Chlorella pyrenoidosa. Samples of activated and digested sludge from the Chinese University Sewage Treatment Plant were extracted by submersion into distilled water at 22C for 24 hours, dispersion into distilled water by an electric blender for 20 minutes, or soaking in 0.1 M ammonium acetate for 24 hours at 22C. Extracts obtained from sludge subjected to these three methods were used at 1%, 2%, and 4% concentrations in algal media to test the growth rate of C. pyrenoidosa. Results of cell counts taken at 2-day intervals for 2 weeks showed that only the media containing sludge extracts obtained with ammonium acetate gave poor algae growth. The media made up with sludge extracts obtained from the other two procedures gave algal growth rates similar to that of control media. These findings were attributed to the high NH3-N levels and low pH of the ammonium acetate extracted sludge extracts. Digested sludge extracts had lower levels of macronutrients such as water-soluble phosphate and nitrogen, and therefore yielded algal cells containing a lower protein content than those grown on extracts of activated sludge. SLUDGE DEWATERING,
Pierson and Company, Manchester (England).
H. G. W. Pierson.
Water and Waste Treatment, Vol 23, No 9, p 41-42, 44, September, 1980.

Descriptors: *Sludge treatment, *Dewatering, *Drying, Incineration, Waste treatment, Sludge, Filters, Filtration, Screens, Centrifugation.

Considering the cost factor alone, it is usually advantageous to treat sludge on site if it arrives in quantities in excess of 2,000 gallons per week. While it was formerly customary to dewater through incineration whenever possible, increased fuel costs have now restricted this practice to those substances for which it is required by law or for which there is no other possible treatment. The thought that the drier the cake, the lower the overall cost, is criticized. Slightly wet cakes pack much better, and the actual disposal cost is shown to be practically identical whether the cakes are very dry or slightly wet. Types of sludges include colloidal, semi-colloidal, granular, crystalline, fibrous and coarse solids. In most cases it is advantageous to thicken a sludge prior to filtration or separation. Two basic methods for dewatering sludge are filters and gravitaional force. Types of equipment to be considered include filter presses, rotary vacuum drum or rotary vacuum belt filters, gravity belt and compression belt filters, horizontal vacuum belt filters, sock filters, centrifuges or screens. The choice of an effluent filter is extremely important, as important as choosing a proper filter for process slurries. (Baker-FRC)

CONCEPTION OF PLANS FOR A MARSEILLE PURIFYING FACILITY. (CONCEPTION DU PROJET DE LA STATION D'EPURATION DE MARSEILLE),
Inspecteur General des Services Techniques, Marseille (France).
G. Lacroix, M. Duclary, and B. Hoyaux.
Progress in Water Technology, Vol 12, No 4, p 731-755, 1980. 11 Fig, 1 Tab.

Descriptors: *Waste water treatment, *Sewage treatment, *Water treatment, Municipal wastes, Water pollution, Sludge treatment, Marseille(France), France.

Plans for waste water treatment facilities for the city of Marseille, population 1 million, were developed in order to reduce pollution of the Mediterranean Sea. Designers considered the nature of the sea, the influent, the sewage system, the water courses in the area, water and sludge treatment, future sites for treatment plants, and sludge utilization. Following these studies, the city decided to build an underground primary sedimentation water treatment plant in the urban area and a sludge treatment plant outside the city. The plant will be in service in 1983. Costs of construction are estimated at 520 million francs. If periodic studies of the sea indicate the necessity for a second stage treatment facility, this will be considered. (Cassar-FRC)

ADVANCED PRIMARY TREATMENT FOR OCEAN DISCHARGE,
Towill (R. M.) Corp., Honolulu, HI.
S. T. Yamanaka, Jr., O. E. Albertson, and R. Eisman.
Progress in Water Technology, Vol 12, No 4, p 653-683, 1980. 18 Fig, 7 Tab.

Descriptors: *Sewage treatment, *Honolulu, *Sand Island, *Municipal wastes, *Flotation, Waste water treatment, Sludge treatment, Clariflotator, Outlets, Oceans, Sea water, Hawaii, Air flotation, Sludge disposal, Waste treatment, Milan, Illinois, Burlingame(CA), California.

Some cities which face mandatory secondary treatment before discharging their waste water into the ocean are questioning the high costs and the real benefits of this proposed procedure. The paper discusses types of waste and their possible methods of treatment. Details of improved facilities at Sand Island, waste water treatment plant for the City of Honolulu, are given. The key to the Sand Island plant design is an advanced primary treatment stage using six 46 meter diameter flotation-clarifiers to remove light suspended solids and flotables by dissolved air flotation. Heavy materials settle to the bottom of the tank. The outfall, deepest in the world, is 74 meters deep and 4,240 meters long. Detailed operating data for the plant, which started operation in late 1978, are presented. Other flotation-clarification case histories discussed are Milan, Illinois, and Burlingame, California. Sludge handling and disposal methods are discussed. (Cassar-FRC)
W81-01079

NEW CONCEPTS FOR THE TREATMENT OF SEWAGE DISCHARGED TO THE SEA,
Hydrotechnic Corp., New York.
R. Nebolsine.
Progress in Water Technology, Vol 12, No 4, p 639-652, 1980. 5 Fig, 11 Ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Filtration, *Municipal wastes, *Water pollution sources, Coagulation, Effluents, Cleveland, Coasts, Sea water, Contact Coagulation-Ultra High Rate filtration.

The Contact Coagulation-Ultra High Rate filter system is applicable to treatment of sewage before discharge into the sea. Sewage, after passing bar racks, is elevated to pass through rotary screens. After a very short coagulation treatment, the water passes through filters. Effluent is then disinfected with ozone or chlorine, if desired. This process, tested in the city of Cleveland, removed 70% to 80% of suspended solids; 70% to 90% of oils, heavy metals, phosphates, etc.; and 58% to 72% BOD. There are many advantages to the ultra high rate filtration system: it removes many contaminants to the same degree as does secondary treatment at lesser cost, reduces pathogens, occupies 6 to 10% of the area of an equivalent secondary plant, requires 20 minutes total treatment time versus the conventional 5 to 8 hours, requires 0.06 kilowatt hours of energy per cubic meter treated, treats storm runoff easily, occupies an enclosed building, and produces sludge which can be pumped inland for further treatment. Diagrams of plants with capacities of 25, 50, 100, and 200 million gallons per day are provided. (Cassar-FRC)

IMPROVED WASTEWATER TREATMENT FOR HOLIDAY RESORT TOWNS ON THE COAST,
M. E. Garrett, and P. del Rio.
Progress in Water Technology, Vol 12, No 4, p 723-730, 1980.

Descriptors: *Waste water treatment, *Municipal wastes, Sewage treatment, *Oxygen requirements, *Pumping plants, *Resort towns, Coasts, Ozone, Aerobic treatment, Respiration, Water treatment, Megox process, Primox process.

A typical waste water treatment facility for a seaside resort town located near a small river is described. Sewage is oxygenated within the sewer at a pumping station located at the present collection point. Sewage is pumped upgrade, preferably along a river course, to a treatment plant outside of town. After primary settlement, use of filtration, activated sludge treatment, or the Megox process is possible. In the last-mentioned process, oxygenated sludge is recirculated in the lower part of the tank, the upper part acting as a clarifier. The resulting sterile effluent can be transferred through pipes adjoining the river course and be discharged

at sea. A formula for daily oxygen requirements is given. This considers respiration rate, diameter of the main, and sewage retention time in the main. Presence of sulfide requires additional oxygen. The advantages of this process for resort towns are its adaptation to wide fluctuations in population, low capital costs, and prevention of sulfide odor. (Cassar-FRC)

HYDRAULIC EFFICIENCY OF WASTEWATER LAGOON SYSTEMS,
Hazen and Sawyer, Hollywood, FL.
G. W. Bors, and P. E. Robinson.
Tappi, Vol 63, No 11, p 149-151, November, 1980. 6 Fig, 3 Tab.

Descriptors: *Detention reservoirs, *Pulp wastes, Pulp and paper industry, *Waste storage, *Waste water treatment, *Lagoons, Chemical wastes, Industrial wastes, Oxidation lagoons, Stabilization, Activated sludge, Sludge treatment, Waste treatment, Aeration, Ponds, Performance, Efficiencies.

Four case studies of pulp and paper mill waste water lagoon systems illustrate the problem of short-circuiting, which results in reduced hydraulic detention times and decreased treatment efficiency. Corrective measures are described. In each situation time-of-travel and circulation studies were performed using Rhodamine WT dye and a continuous flow cell fluorometer with chart recorder. In the first case, an aerated stabilized basin and oxidation pond system, addition of diversion curtains changed circulation and improved performance. The second system consisted of 6 interconnected natural ponds. Surface baffling was suggested to remedy a temperature stratification condition where the warm waste water remained within the upper 4 feet of the pond. Case 3 was a shallow aerated stabilized basin which demonstrated 72% volume utilization and a 26 hour actual retention time (theoretical, 36 hours). This pond contained several strategically located rotating aeration units. Two additional units were scheduled for installation. The last case, an activated sludge aeration tank, was studied after installation of additional baffles, submerged static mixers, and a return sludge system produced an overall volume utilization of 92%. Water and Sewage Works, Vol 127, No 11, p 44, 45, 66-68, November, 1980. 2 Fig.

Descriptors: *Digestion, *Sludge digestion, *Gas, *Energy conversion, Methane, Heat, Electric power production, Electric generators.

Digester gas, formerly seen as an energy source not worth exploiting, can be used to generate electric power, power boilers to heat sludge and buildings, and run incinerators. Detailed information for a 5 million gallon per day plant is given, with energy balances calculated for electric power generation and digester heat requirements. Suggestions for efficient gas storage and boiler and engine design are described. (Cassar-FRC)

LOS ANGELES, GLENDALE SHARE REUSE PLANT'S PROVISIONS,
Water and Sewage Works, Vol 127, No 11, p 16, 69, November, 1980.

Descriptors: *Water reuse, *Sewage treatment, *Glendale(CA), *Los Angeles, Waste water treatment, Municipal wastes, Sewage treatment, Performance, Sedimentation, Aeration, Filtration, California.

Detailed information on the design and operation of the Los Angeles-Glendale Water Reclamation Plant is presented. This plant, which began functioning May 25, 1976, provides hydraulic relief for the North Outfall Sewer, eliminating an immediate need for increasing sewer capacity, and reclaims waste water for irrigation and industrial use. Capacity of the plant is 20 mgd, annual operation costs are 1 million dollars, and construction costs were 13.6 million dollars. Primary, secondary and tertiary treatments are done. After solid materials are removed by screening and primary sedimentation, activated sludge processing takes place in 6 aeration tanks (240 x 32 x 16 feet) and 10 secondary sedimentation tanks (170 x 20 x 9 feet). Tertiary treatment consists of filtration and chlorination. The city of Glendale uses a major proportion of this processed water for park irrigation and for operation of its steam power plant. SOLIDS-CONTACT CLARIFICATION BRINGS OUT BEST OF TRICKLING FILTERS,
Brown and Caldwell, Eugene, OR.
D. F. Norris.
Water & Sewage Works, Vol 127, No 11, p 28, 29, 59, 60, November, 1980. 2 Fig, 2 Tab.

Descriptors: *Waste water treatment, *Sewage treatment, *Solids contact, *Trickling filters, Processes, Sludge treatment, Filtration, Corvallis(OR), Municipal wastes.

The capacity of the Corvallis, Oregon, waste water treatment plant was doubled to 10 mgd by incorporating the trickling filter process with solids contact clarification, replacing the activated sludge process as of January, 1979. This process has about half the energy requirements of the activated sludge method. The key to this process is sludge recirculation and aeration, coupled with new solids-contact clarifiers, which are deeper than the conventional ones and have a center well. Here, mild stirring promotes agglomeration of fast-settling solids. High quality effluent is produced by maintaining circulated solids in an aerobic state for one fifth of the process time. The sludge produced is so dense that it can be wasted directly to the primary sedimentation tanks, where sludge densities are routinely 5.5 to 6.5%. (Cassar-FRC)

ACTIVATED SLUDGE WASTEWATER TREATMENT--STOICHIOMETRIC RELATIONSHIPS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Civil Engineering.
J. H. Sherrard.
Journal of Chemical Technology and Biotechnology, Vol 30, No 8, p 447-452, August, 1980. 7 Fig, 3 Tab, 6 Ref.

Descriptors: *Activated sludge, *Waste water treatment, *Model studies, *Mathematical models, Sewage treatment, Effluents, Design, Nitrification, Chemical oxygen demand, Oxygen requirements, Alkalinity.

A mathematical model based on kinetic and stoichiometric principles is used to formulate and solve a sample problem in the treatment of activated sludge waste water. This technique can help the engineer to compare treatment alternatives during the design stage and the plant operator to attain maximum efficiency during operation. Graphs illustrate the following relationships as function of mean cell residence time in days: effluent COD and nitrification, daily waste sludge production and oxygen requirements, % carbon distribution, % nitrogen, oxygen uptake per day per pound of activated sludge under aeration, and net change in alkalinity. (Cassar-FRC)

SCREENING AT A FELLMONGERY.
Effluent and Water Treatment Journal, Vol 20, No 9, p 457, September, 1980.

Descriptors: *Effluents, *Water pollution sources, *Screens, Animal wastes, Discharge(Water), *Industrial wastes.

Problems with blockage and choking of effluent drainage lines and pumps at the Retford sheep skin processing plant were solved by the installation of a screen just below ground level. As the effluent cascades into the screen drum the solid fraction is retained inside the drum while the liquid passes through. The effluent drops from the dolly (primary skin cleaning vat) to the screen drum about every 2 hr during the day, at which time the unit handles about 18,000 liters over a 30 min period. The system has been in operation about 7 mo and has overcome most of the problems that had been encountered in processing this difficult effluent. (Baker-FRC)

FLOW EQUALIZE ALL INFLUENT,
Holloway (Max) Engineering Co., Muskogee, OK.
J. Updike.
Water and Wastes Engineering, Vol 17, No 10, p 20-23, October, 1980. 2 Fig, 5 Tab.

Descriptors: *Treatment facilities, *Inflow, *Flow rates, Flow control, *Waste water treatment, Trickling filters, Wet filters, Wet seasons, Basins, Oklahoma, Municipal wastes.

In-line flow equalization basins were installed in the Muskogee, Oklahoma waste water treatment plant to equalize wet weather flows to within existing plant capacity. The plant, a 10 mgd two-stage trickling filter facility, never consistently met NPDES requirements. An infiltration/inflow analysis led to the in-line flow equalization design. The plant passes dry and wet weather flows through the two basins at a preset rate and gains the added benefits of emergency storage capacity and grit removal. The two basins are each 19 ft deep, and have a total usable volume of 35,000,000 gal each. Effluent from the basins is controlled by a 24 inch venturi tube in the return line to the main plant. PHILOSOPHY OF THE SAFE DRINKING WATER ACT AND POTABLE REUSE,
North Carolina Univ. at Chapel Hill.
D. A. Okun.
Environmental Science & Technology, Vol 14, No 11, p 1298-1303, November, 1980. 13 Ref.

Descriptors: *Potable water, *Water reuse, *Legislation, *Public health, Reviews, Waste water, Water utilization, Water treatment, Disinfection, Tertiary treatment, Organic compounds, Water supply, Groundwater, Federal Water Pollution Control Act, Water pollution, Water quality.

A review of the principles of obtaining safe drinking water is presented, along with a historical outline of public health considerations which led to the adoption of these principles. Sanitary surveys mandated by the US Public Health Service in 1962 stressed the identification of sources of pollution and the obtainment of drinking water from the safest possible sources. Prior to the 1962 enactments, little attention was paid to the adequacy of the supply, a factor of major concern to the consumers. While water reuse along rivers increased water supplies, it often caused concentration of pollutants at downstream sites. In the 1800's, relocation of water intake sources in London to sites farther upstream on the River Thames led to reductions in outbreaks of cholera. The use of chemicals for water disinfection in the post-World War II era offered protection against infection from reused water supplies. Reduction of harmful organic compounds in potable water supplies could be achieved by chemical treatment of drawing from unused water sources. Reuse of nonpotable water

was stressed to free potable water supplies from unnecessary contact with man-made pollutants. Problems associated with rendering waste waters potable through technological treatments are many. US government policy stressing research in the treatment of waste water precludes funding for studies of nonpotable water reuse. (Geiger-FRC)

UTILIZATION OF THE WHITE-ROT FUNGUS SPOROTRICHUM PULVERULENTUM FOR WATER PURIFICATION AND PROTEIN PRODUCTION ON MIXED LIGNOCELLULOSIC WASTEWATERS,
Swedish Forest Products Research Lab. Stockholm. Dept. of Chemistry.
M. Ek, and K-E. Eriksson.
Biotechnology and Bioengineering, Vol 22, No 11, p 2273-2284, November, 1980. 3 Tab, 22 Ref.

Descriptors: *Fungi, *Industrial wastes, *Proteins, Industrial water, *Waste water treatment, Laboratory tests, Cellulose, Feeds, Biochemical oxygen demand, Sweden.

A laboratory-scale continuous process that allows a direct conversion of polymeric material into easily harvested fungal protein was developed. This process, which utilizes white-rot fungus Sporotrichum pulverulentum, produces protein and purifies water. Tests on waste water from a fiberboard factory indicated that the degree of water purification is dependent upon residence time. Long residence times cause all carbohydrates and most of the lignin structures to be degraded, but result in low productivity. Production of mycelium for feedstuff requires a holding time of about 15 hr, corresponding to a 60% BOD reduction. If water is recirculated, the 15 hr residence time might be sufficient to keep the content of soluble organic matter at an acceptable level. (Small-FRC)

SAND CAMBISOL FUNCTIONING AS A FILTER THROUGH LONG-TERM IRRIGATION WITH WASTEWATER,
Technische Univ., Berlin (Germany, F.R.).
H-P. Blume, R. Horn, F. Alaily, A. N. Jayakody, and H. Meshref.
Soil Science, Vol 130, No 4, p 186-192, October, 1980. 6 Fig, 3 Tab, 8 Ref.

Descriptors: *Waste water disposal, *Cycling nutrients, *Filtration, Forests, Nutrients, Irrigation, Forest soils, Dynamics, Drainage, Environmental effects, Flooding, Leaching, Estimating equations, Rainfall, Air pollution, Soil horizons.

Waste water disposal by irrigation onto arable land provides water purification before the water is returned to the natural reservoirs and recycling of nutrients. Comparisons were made of a cambisol supplied with waste water since 1900 and a similar soil from under a pine forest with no application of waste water. Parameters examined in each soil were total porosity, pore size distribution, hydraulic conductivity, nitrogen forms, exchangeable ions, and heavy metals. No great differences were noted in texture and bulk density of the two soils. Long-term waste water irrigation of the cambisol caused a slightly increased organic content as well as higher levels of phosphorus and nitrogen. Copper and zinc were also highly retained by the cambisol when compared to the forest soil. Manganese and zinc were lost in the subsoil of the cambisol due to low oxidation potentials. Both sites underwent changes in elemental content due to intense air pollution and the effects of rainfall. Changes in soil content of elements were calculated by a mathematical formula based on soil horizon data. The dynamics of flooding and drainage at the two sites and their effects on soil composition were also investigated. Results of these studies indicate sharp reductions in the filtering of iron and manganese nutrients. (Geiger-FRC)

STORAGE-INDUCED DENITRIFICATION USING SEQUENCING BATCH REACTOR OPERATION,
Maryland Univ., College Park. Dept. of Civil Engineering.
J. E. Alleman, and R. L. Irvine.
Water Research, Vol 14, No 10, p 1483-1488, October, 1980. 5 Fig, 1 Tab, 13 Ref.

Descriptors: *Denitrification, *Wastewater treatment, *Organic compounds, *Carbon, *Bacteria, Nitrogen, Design criteria, Sewage bacteria, Nitrite, Nitrification.

Bacterial storage may substitute for raw-waste organic carbon components as the electron-donor substrate required for denitrification. Bench-scale studies of storage induced denitrification were conducted using a sequencing batch reactor. By operating the reactor in a mode conducive to the development of cellular storage, the system maintained a consistent 92% or greater reduction in total nitrogen without a carbon supplement. Depletion of the cellular glycogen reserve was observed during the denitrification reaction. This system has potential application to advanced wastewater treatment. It suggests that denitrification can be maintained solely on the basis of endogenous activity. (Titus-FRC)

ENHANCEMENT OF PCBS BIODEGRADATION BY SODIUM LIGNINSULFONATE,
National Water Research Inst. Burlington (Ontario).
D. Liu.
Water Research, Vol 14, No 10, p 1467-1475, October, 1980. 7 Fig, 12 Ref.

Descriptors: *Biodegradation, *Bacteria, *Gas chromatography, Cultures, Water analysis, *Polychlorinated biphenyls, Surfaces, Growth rates, Oxidation, Microbial degradation, Chlorination, Boundary processes.

Microscopic examinations and growth studies indicate that biodegradation of commercial PCBs is enhanced by the use of sodium ligninsulfonate in the culture medium of Pseudomonas bacteria. Sodium ligninsulfonate stimulates the bacterial growth rate and biodegrades without being used itself. It thus allows cells to overcome the substrate limiting factor of surface area. Analyses of the culture broth by gas chromatography revealed that the bacteria could degrade 300 parts per million of Aroclor 1254 after 18 days incubation. Manometric data demonstrate that lower chlorinated PCBs are oxidized faster than higher chlorinated PCBs. Commercial preparations of PCBs are mixtures of many different isomers with varying chlorine content. The properties of these mixtures are vastly different and complex to study. Since PCBs are among the most persistent lipophilic substances found environmentally, the significance of interface control on biodegradation rates has potential application for other lipophilic compounds in the aquatic environment. ULTRAFILTRATION PROCESSES FOR POLLUTION CONTROL AND CHEMICAL REUSE IN THE TANNING INDUSTRY,
Naples Univ. (Italy). Facolta di Ingegneria.
E. Drioli, and B. Cortese.
Desalination, Vol 34, No 1/2, p 131-139, July/August, 1980. 3 Fig, 5 Tab, 3 Ref.

Descriptors: *Filtration, *Waste water treatment, *Industrial wastes, Pilot plants, Reclaimed use, Water reuse, Effluents, *Water quality control, Methodoloy, Organic compounds, Recirculated water, Recycling.

Experiments were conducted to determine the effectiveness of ultrafiltration in treatment of tannery wastes. Dehairing and degreasing produce the most highly polluting wastes of the tanning process. Effluents contain high levels of sulfur, amines, mercaptans and sludges from skin and hair. Noncellulosic membranes able to function in the pH range from 2 to 13 and at temperatures up to 50C were used in two pilot ultrafiltration plants. Experiments were conducted using tubular membranes, continuous recycling and continuous feeding of waste water, and pressures of 3.2 atmospheres and 3.0 atmospheres. Results show a decrease in the selectivity of the membrane toward grease removal with increasing temperature, accompanied by increased permeation flow. In the experiments in which the concentrated solution was continuously recycled, the flux decline was rapid, dropping from 150 liters per hour to 10 liters per hour in 3 hours. Ultrafiltration of dehairing effluents produced a near zero rejection towards electrolytic species and produced a high rejection towards proteinaceous and colloidal substances. The simplicity of ultrafiltration and the possibility of controlling the concentration of the chemical species in the permeate by varying membrane type and process conditions make this method competitive with other conventional methods. RESIDENCE TIME DISTRIBUTION IN SUBMERGED BIOFILTERS,
Technical Univ. of Denmark, Lyngby. Dept. of Sanitary Engineering.
M. Riemer, G. Holm Kristensen, and P. Harremoes.
Water Research, Vol 14, No 8, p 949-958, August, 1980. 12 Fig, 3 Tab, 12 Ref.

Descriptors: *Model studies, *Denitrification, *Biological membranes, *Filters, Mathematical studies, Biological treatment, Tracers, Bubbling, Nitrogen, Adsorption, Nitrates, Kinetics.

When kinetic models for chemical or biological reactions are evaluated the residence time distributions are often utilized. Often results from tests on submerged biological denitrification filters deviate systematically from those expected for the simple flow models by exhibiting pronounced tailing. Tailing also makes the estimation of the Peclet number from the variance of the response curve very difficult or impossible. A mathematical model is presented in which the head of the distribution results from the usual longitudinal dispersion in a porous medium. In this system a group of pulse response curves consisting of a leading head are generated (almost Gaussian) and are followed by a tail with exponential decay. The characteristics of the model curves were identical to those formulated under experimental conditions. Tests with a dye tracer showed marked adsorption effects. The tracer was useful in monitoring over-all performances of submerged filters and determining the longitudinal dispersion and volume occupied by biofilm and bubbles. Non-bubbling trials using tritium as tracer gave little deviation between pulse and step-down experiments with regard to tailing due to irregular biofilm morphology. When significant sections of the surface are bared by nitrogen bubbling, the degree of coverage and mean biofilm thickness cannot be estimated with great certainty. (Geiger-FRC)

THE THERMAL SENSITIVITY OF NITRIFICATION AS A FUNCTION OF THE CONCENTRATION OF NITROGEN SUBSTRATE,
Massachusetts Inst. of Tech., Cambridge. Dept. of Mechanical Engineering.
A. V. Quinlan.
Water Research, Vol 14, No 10, p 1501-1507, October, 1980. 5 Fig, 2 Tab, 31 Ref.

Descriptors: *Thermal properties, *Oxidation, Nitrite, *Mathematical studies, Nitrogen, *Nitrification, Ammonia, *Bacteria, Temperature, Chemical reactions, Microorganisms, Waste treatment, Chemical degradation.

The joint influence of substrate concentration and temperature on bacterially mediated ammonia and nitrite oxidation is analyzed using rate laws from the literature. Results demonstrate that optimum temperature relations offer a means for controlling thermally induced accumulations of nitrites in nitrifying systems whose temperatures can be manipulated. This has potential application in small sewage treatment plants, cooling towers and ponds. At present temperature control is practiced in several industrial wastewater treatment plants, but is not economically feasible in most domestic

wastewater treatment plants because of the large flows involved. Thermal enrichment of nitrifying systems poses a severe ecotoxicological hazard, because nitrites at concentrations as low as .5 parts per million are carcinogenic and anoxogenic and because concentrations increase substantially as temperature increases. COMMENT,
Proctor and Gamble Ltd., Newcastle-upon-Tyne (England).
A. P. Walker, W. F. Holman, and R. H. Wendt.
Water Research, Vol 14, No 1, p 95-101, January, 1980. 15 Ref.

Descriptors: *Sludge treatment, *Heavy metals, *Water pollution sources, *Laboratory tests, *On-site investigations, Publications, Suspended solids, Detergents, Chemical wastes, Sewage treatment, Biodegradation, Water properties, Water quality.

Comments concerning the findings of Stoveland et al (1979) on the laboratory removal of nitrilotriacetate from artificial sewage are presented. A review of the scientific literature establishes that nitrilotriacetate is effectively removed during sewage treatment over a wide range of conditions, including soft water, and that it does not cause increased metal pollution of receiving waters. Under laboratory conditions, nitrilotriacetate can solubilize metals. However, under practical conditions, concentrations of cadmium, nickel and mercury in domestic wastewater are low, the aerobic biological wastewater treatment systems are capable of removal rates greater than 90%, and nitrilotriacetate concentrations in effluent are insignificant. It is suggested that the laboratory results of Stoveland et al. omitted data on suspended solids which are significant in heavy metal removal and that the laboratory conditions are not comparable to municipal conditions. Statistical evaluations were also absent. Nitrilotriacetate has practical application as a detergent builder. (Titus-FRC)

RESPONSE TO COMMENTS BY A. P. WALKER, W. F. HOLMAN AND R. H. WENDT,
Imperial Coll. of Science and Technology, London (England). Dept. of Public Health Engineering.
S. Stoveland, J. N. Lester, and R. Perry.
Water Research, Vol 14, No 1, p 103-107, January, 1980.

Descriptors: *Sewage treatment, *Detergents, *On-site investigations, *Laboratory tests, Biodegradation, Publications, Heavy metals, Sludge treatment, Suspended solids, Chemical wastes, Water properties, Water quality.

Use of nitrilotriacetic acid as a detergent builder may have adverse influence on metal removal during biological waste water treatment in some European areas. Where high population density and intense industrial activity occur together, large quantities of detergent builder in domestic waste water and significant concentrations of heavy metals from industrial and domestic sources may be combined. Water reuse may also be practiced. Under such conditions, nitrilotriacetric acid may diminish metal removal in waste water treatment. Most scientific literature on this subject is from Canada, where the low nitrilotriacetic acid concentrations in effluent may be attributable to great dilutions by the abundant receiving waters. Laboratory simulations of conditions in European population centers can be resolved by research which is now in progress using pilot scale equipment treating real sewage. (Titus-FRC)

EFFECT OF ALCOHOLS ON THE MECHANICAL AND TRANSPORT PROPERTIES OF ASYMMETRIC CELLULOSE ACETATE MEMBRANES,
Naples Univ. (Italy). Ist. di Principi di Ingegneria Chimica.
F. Alfani, E. Drioli, and L. Nicolais.
Water Research, Vol 14, No 5, p 461-466, May, 1980. 7 Fig, 2 Tab, 11 Ref.

Descriptors: *Membrane processes, *Alcohols, Membranes, Separation techniques, Organic compounds, Mass transfer, Reverse osmosis, Treatment, *Waste water treatment, Strength of materials, Tensile strength.

One problem in the use of reverse osmosis (RO) for waste water treatment is the choice of a proper membrane, since the interaction with organic compounds and therefore membrane selectivity is strongly dependent on membrane structure. The interaction between solute and membrane was analyzed in the presence of various alcohol solutions using a combined analysis of tensile properties and rejection performance of different RO membranes. The findings indicate that commercial cellulose acetate membranes may be used in ultrafiltration processes to recover alcohols from the water. The analysis of stress-strain curves of virgin membranes conditioned in alcohol solution can assess the potentiality of the cellulose acetate membrane in the alcohol recovery process. (Baker-FRC)

A CORRELATION METHOD FOR THE ESTIMATION OF RETENTION TIMES AT FULL-SCALE SEWAGE TREATMENT PLANTS,
University of Strathclyde, Glasgow (Scotland) Dept. of Applied Physics.
J. M. Crowther, J. F. Dalrymple, and T. Woodhead.
Water Research, Vol 14, No 6, p 567-574, June, 1980. 6 Fig, 3 Tab, 16 Ref.

Descriptors: *Retention, *Sewage treatment, *Biochemical oxygen demand, *Suspended solids, *Correlation analysis, Indicators, Tracking techniques, Theoretical analysis, Flow rate, Variability, Statistical methods, Water analysis, Dye releases, Path of pollutants, Hydraulics, Settling basins, Sediments, Evaluation.

An alternative method for measuring retention time is described. Estimates of retention time are derived by applying correlation analysis to flow rates. The method yields an average retention time, and thus provides information on the average hydraulic performance of the unit. Diurnal and random variations in influent biochemical oxygen demand and suspended solids are used as time-varying tracers. Three time series experiements were conducted using biochemical oxygen demand results taken from samples at varying flow rates. Correlation analysis was performed, uncertainties in periods and retention times were calculated, and influent and primary tank biochemical oxygen demands were cross-correlated. Results show no clear dependence on flow rates. Discrepancies in results between correlation estimates and flow-based estimates suggest that approximately 50% of the sedimentation tank volume is not exploited by the flow and represents a dead volume. EXPERIMENTAL ASSESSMENT OF HALOFORM REACTION PRECURSORS (ETUDE D'UNE METHODE D'EVALUATION GLOBALE DES PRECURSEURS DE LA REACTION HALOFORME),
Poitiers Univ. (France). Lab. de Chimie XI.
M. Dore, and J. Goichon.
Water Research, Vol 14, No 6, p 657-663, June, 1980. 6 Fig, 1 Tab, 11 Ref.

Descriptors: *Chlorination, *Water purification, *Spectrophotometry, *Chemical analysis, Iodine, Halogens, Chemical reactions, Chlorine, Analytical techniques, Ammonia, Haloforms, Haloform precursors.

A method for evaluating haloform reaction precursors is explained. The principle of the analysis is based on the action of iodine on the precursors and on the measurement of the amount of iodoform obtained by spectrophotometry in the utra-violet band. The reaction parameters (conditions of pH and of extraction, time of reaction) were studied to produce a simple analytical method of operating, presenting both precision and sensitivity. Iodine constitutes an interesting reagent for this measurement because it is not consumed by ammonia and it displays four characteristic bands in the ultra-violet range. The reaction gives good results with ketonic precursors; however, with metapolyhydroxybenzenes, results are inferior to those obtained by chlorination. (Titus-FRC)

LOS ANGELES TO MEET REGS WITH ENERGY-MISER SLUDGE PROCESSOR,
D. C. Tillman.
Water and Sewage Works, Vol 127, No 11, p 30-32, 62, November, 1980. 3 Fig.

Descriptors: *Sludge disposal, *Los Angeles, *Hyperion plant, *Sludge treatment, *Ultimate disposal, Municipal wastes, Waste water treatment, Waste disposal, Thermal sludge disposal, Electric power production.

To comply with directives prohibiting disposal of sewage sludge in Santa Monica Bay, the city of Los Angeles chose a sludge treatment method which produces energy from gases formed during digestion. The Hyperion Plant, which will be fully operational by 1985, will be capable of processing 264 tons per day (dry basis) using the thermal sludge disposal system. The process not only provides energy for evaporation of sludge water and for thermal destruction of solids by pyrolysis, it produces a surplus of 200,000 kilowatt hours of electricity per day. The thermal disposal system has several advantages over conventional sludge disposal systems: low energy requirements, greatly reduced amount of solids handled, an essentially sterile sludge, 99+% solids removal, and an effluent closely approaching distilled water. PACKED BED FILTRATION: EXPERIMENTAL INVESTIGATION AND CONCEPTUAL ANALYSIS OF FILTER RIPENING MODEL,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
J. E. Tobiason.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-151961. Price codes: A07 in paper copy, A01 in microfiche. MS Thesis, 1979. 136 p, 30 Fig. OWRT-A-104-NC(1), 14-34-0001-9035.

Descriptors: Filtering systems, Packed beds, *Water treatment, *Filters, *Waste water treatment, Filtration, *Separation techniques, Evaluation, Packed beds, Suspended solids, Particle size, Liquid-solids separation, Filter ripening model.

A theory for filter ripening (Ali, 1977) is subjected to experimental and conceptual analysis in order to test its applicability under conditions much different than those for which it was calibrated and verified. The filtration theory incorporates physical and chemical characteristics of the entire filtration system in predicting the removal of suspended solids and the development of head loss throughout a filter run. Filtration performance is a function of filter variables (bed depth, porosity, filtration velocity, media size and type) and suspension variables (solids concentration, temperature, particle size and type). The chemistry of the system (ionic strength, polymer type and dose) also controls filter performance and is included in the theory. Experiements are conducted by filtering suspensions of Min-U-Sil particles at two different size ranges at two concentrations and flow rates through pilot filters. Four identical filter columns, each containing different sized media, are used in each experiment. Solids removal efficiency is evaluated by measuring the light scattering of influent and effluent samples. Head loss is determined from open manometers connected to the filter columns. The experimental results are compared to predictions obtained from the theory for filter ripening. In general, the effects of variations in collector size, suspended solids concentration, flow rate and particle size on filter performance are modeled correctly, but exact fits using consistent values for model coefficients are not obtained. Removal efficiency is modeled well but head loss predictions are not generally in agreement with the expeimen-

tal results. Conceptual considerations yield possible explanations for these discrepancies.

TREATMENT OF DILUTE METAL EFFLUENTS IN AN ELECTROLYTIC PRECIPITATOR,
University of the Witwatersrand, Johannesburg (South Africa). Dept. of Chemical Engineering.
A. W. Bryson, and K. A. Dardis.
Water SA, Vol 6, No 2, p 85-87, April, 1980. 1 Fig, 1 Tab, 11 Ref.

Descriptors: *Industrial wastes, *Metals, *Effluents, *Waste water treatment, *Electroplating, Electrodes, Nickel, Chromium, Copper, Zinc.

The presence of metals in industrial effluents may cause problems during sewage treatment processes which use bacterial action to digest sludge. A test plant was constructed to remove these metals from dilute solutions by electrolytic precipitation using a particulate bed electrode cell. A fixed-bed cell (1900 mm x 350 mm x 5 mm) containing crushed graphite of a particle size of 1.2 mm to 1.7 mm was able to reduce the concentrations of nickel, chromium, copper, and zinc in electroplating works effluent water from 16.2-37.5 mg per liter to 1.5 mg per liter or less. Current ranged from 20 to 40 amperes; voltage ranged from 3.0 to 5.4 volts; and the flow rate was 180 liters per hour for nickel and chromium and 360 liters per hour for copper and zinc. (Cassar-FRC)

METAL UPTAKE BY CROPS GROWN OVER ENTRENCHED SEWAGE SLUDGE,
Science and Education Administration, Beltsville, MD. Biological Waste Management and Organic Resources Lab.
L. J. Sikora, R. L. Chaney, N. H. Frankos, and C. M. Murray.
Journal of Agricultural and Food Chemistry, Vol 28, No 6, p 1281-1285, November/December, 1980. 4 Tab, 22 Ref.

Descriptors: *Sludge disposal, *Crop response, *Metals, *Waste disposal, *Sewage sludge, Municipal wastes, Lime, Disposal, Oats, Wheat, Chard, Entrenchment, Ultimate disposal, Waste water treatment, Landfills, Agriculture.

Oats, wheat, and chard were grown on plots containing entrenched sewage sludge from the Blue Plains waste water treatment plant, Washington, D.C. Two forms of sludge were used, digested and raw limed, in a study of metal uptake by crops. Lime was applied to half the digested and half the control plots to determine the influence of pH on metal uptake. Chard accumulated higher metal levels than either wheat or oats. Absorption of metals by plants grown over sludge was greatest using unlimed digested sewage (pH 5.4). Liming these plots reduced metal uptake slightly. Plants absorbed metals from limed raw sludge plots (pH 6.7) to an equal or lesser degree than in control plots. These results suggested that agricultural crops may be grown over entrenched sludges (raw or digested) if the sludge is low in heavy metal content. (Cassar-FRC)

Current outbreaks of giardiasis have been associated with exposure to Giardia lamblia in municipalities that use inadequately-treated surface water for drinking water. Methods of coagulation and dual media filtration to treat water to remove the G. lamblia cysts were investigated in pilot plant studies. Electron microscopic studies of cysts collected on 5.0 micrometerporosity membrane filters were also conducted. G. lamblia cysts isolated from fecal samples from human giardiasis patients and other fecal material were diluted in distilled water to known concentrations, and the dilutions were used to spike pilot plant water supplies. In addition to the 5.0 micrometer Nuclepore membrane, Millipore filters of 5.0 micrometer-pore size were evaluated to increase filtration efficiency. Results showed a greater percent recovery on the Nuclepore filter as opposed to the Millipore filters. Electron microscopic studies of cyst walls showed different patterns of distortion between G. lamblia cysts collected on Nuclepore and on Millipore filters. The implications of cyst distortion on filters for the purification of raw water samples are discussed. (Geiger-FRC)

LOW-COST FILTER SYSTEM MEETS DRINKING WATER STANDARDS,
CH2M/Hill, Redding CA.
R. L. Chapman, and G. R. Benoit.
Public Works, Vol 111, No 9, p 102-104, September, 1980. 1 Fig, 2 Tab.

Descriptors: Turbidity, *Filtration, *Water treatment, *Sacramento River, *Bella Vista Water District(CA), Water quality, Rivers, Pilot plants, Alum, Costs, Annual costs, Capital costs, *Potable water, Standards.

Increasing domestic and irrigation water demand in the Bella Vista Water District, Redding, California, approached the capacity of well sources and required the use of Sacramento River water with objectionable turbidity above 1.0 at minimal added cost. In 1976 pilot plant studies were begun on a low-cost, direct high pressure filtration system. The major objective was to determine the filterability of the Sacramento River water under different turbidity conditions. Construction of the full-scale treatment plant was completed in summer 1978 at a total cost of 6.47 million dollars. Two years operation of this system has proved that the fundamental design is good and that operation and maintenance costs are low. During 1979, 3,428 million gallons of water were treated at a cost of $9.77 per million gallons. Filtered water turbidities averaged less than 0.5 unit, and raw water turbidities ranged from 15 in winter to 1.9 in summer. Studies at higher filtration rates indicated that 6.5 million gallons per day (turbidity 0.2 - 0.4 unit) was produced at the end of a 10 hour test from raw water with 9.5 turbidity. (Cassar-FRC)

CORROSIVENESS OF DRINKING WATER AND CARDIOVASCULAR DISEASE MORTALITY,
Rijksinstituut voor Drinkwatervoorziening, Leidschendam (Netherlands).
B. J. A. Haring, and B. C. J. Zoeteman.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 4, p 658-662, October, 1980. 4 Tab, 10 Ref.

Descriptors: *Hardness(Water), *Human diseases, *Potable water, Hydrogen ion concentration, Epidemiology, Mortality, The Netherlands.

Many epidemiologists have reported that hard water is statistically correlated with low death rate from cardiovascular diseases. A sampling program was carried out in The Netherlands among 28 water supplies to measure pH and water hardness of the drinking water. The pH values were determined, since higher pH values are generally associated with lower metal solvency. A significant negative correlation was found between hardness and pH for the water supplies tested. A possible explanation for these results is that at present most waterworks condition the water in such a way that drinking water is saturated with respect to CaCO3. Also, the saturation pH of hard drinking water is usually lower than that of soft water. The intake of lead and other inorganic constituents was investigated in a proportional sampling study of 50 households with lead piping in each of 20 cities in the Netherlands. The release of lead and copper from metal household water distribution pipes was positively correlated with calcium content. The softer water had higher pH values and lower levels of lead and other metals, in general. (Small-FRC)

COLOUR AND TURBIDITY REMOVAL WITH REUSABLE MAGNETIC PARTICLES-II. COAGULATION WITH MAGNETIC POLYMER COMPOSITES,
Commonwealth Scientific and Industrial Research Organization, South Melbourne (Australia). Div. of Chemical Technology.
N. J. Anderson, B. A. Bolto, R. J. Eldridge, L. O. Kolarik, and E. A. Swinton.
Water Research, Vol 14, No 8, p 967-973, August, 1980. 2 Fig, 10 Tab, 4 Ref.

Descriptors: *Color, *Turbidity, *Flocculation, *Iron oxides, Separation techniques, Settling velocity, Polymers, Resins, Aquatic algae, Water treatment, Water purification, Surface water, Cation exchange, Magnetism.

The coagulation of a turbid, colored river water was enhanced by composite particles containing magnetic iron oxides in polyvinyl alcohol matrix. The removal of turbidity at a given alum dose was increased by uncharged magnetic particles. Desired levels of turbidity were removed at lower doses of alum. When alum plus magnetic iron oxides were used, the rates of floc formation and settling were doubled. The effectiveness of coagulation was increased by grafting linear polymers to magnetic polymers, and the uncharged particles could be reused after rinsing with water. When alum was used with magnetic particles which were grafted with chains of cationic polymers, rapid settling, coagulation of algae, and removal of color and turbidity were achieved. Regeneration of grafted particles was accomplished by addition of brine. Although incomplete regeneration occurred when the cationic magnetic particles were used without alum, good turbidity and color removal from river water were obtained. (Geiger-FRC)

CHLORINE DISAPPEARANCE IN SEA WATER,
Central Electricity Generating Board, Leatherhead (England). Central Electricity Research Labs.
D. Midgley.
Water Research, Vol 14, No 10, p 1559-1560, October, 1980.

Descriptors: *Chlorine, *Bromine, Chemical reactions, *Water chemistry, *Sea water, *Cooling water, Salinity, Ionization, Acid-base equilibrium, Solubility, Chemistry, Catalysts, Water properties, Saline water, Power system operation.

An explanation for chlorine disappearance in sea water is proposed. The oxidation of bromide in seawater produces hypobromite and hypochlorite. In such mixtures, chlorate formation is catalyzed by hypobromous acid. Experiments at carefully controlled pH are needed to confirm the explanation and estimated decay rate. Digestion with concentrated hydrochloric acid under inert atmosphere is recommended for future experimentation. The practical importance of chlorine disappearance in power station cooling waters is questioned. (Titus-FRC)

WASTEWATER CHARACTERIZATION IN A MULTIPRODUCT DAIRY,
North Carolina State Univ., at Raleigh.
R. E. Carawan, V. A. Jones, and A. P. Hansen.
Journal of Dairy Science, Vol 62, No 8, p 1243-1251, August, 1979. 3 Fig, 5 Tab, 12 Ref. OWRT-A-058-NC(3), 14-31-0001-3533.

Descriptors: *Water pollution sources, *Dairy industry, *Industrial wastes, Water quality, Industrial effluents, Waste water characterization, Surcharges, Water costs, *Industrial water, Sewers.

Wastewater characteristics in a multi-product dairy plant were determined in two major drains and for several operations. Monitored characteristics included flow, biochemical oxygen demand, chemical oxygen demand, total suspended solids, total solids, fat, and temperature. Overall, 2.3 liters of wastewater/kg of product were discharged with average concentrations of 3049 mg/liter biochemical oxygen demand, 5451 mg/liter chemical oxygen demand, 2203 mg/liter total suspended solids, 9574 mg/liter total solids, and 1424 mg/liter fat. The biochemical oxygen demand coefficient was 6.91 g/kg of product. Day-to-day variations of waste load/unit product were large. Peak day measures were more than 10 times as high as minimum day measures. Waste load discharged from the plant was related to losses of milk and fat. Losses of milk and milk fat calculated from waste characteristics were greater than indicated by plant records. Municipal charges for water, sewer, and surcharges for a plant processing 200,000 kg of product per day with the average characteristics in this study were predicted to be approximately $18,600 per month. Waste loads for selected operations are presented with suggestions for reduction.

EFFICIENT DESIGN OF STORMWATER HOLDING BASINS USED FOR WATER QUALITY PROTECTION,
North Dakota State Univ., Fargo. Dept. of Civil Engineering.
D. M. Griffin, Jr., C. Randall, and T. J. Grizzard.
Water Research, Vol 14, No 10, p 1549-1554, October, 1980. 6 Fig, 2 Tab, 6 Ref.

Descriptors: *Runoff, *Urban runoff, *Storm drains, On-site data collections, Rainfall-runoff relationships, Small watersheds, Design data, Design criteria, *Water pollution control, Suspended solids, Field data, Settling basins, Unit hydrographs, Water pollution sources, Surface runoff, Storm water.

A rational method for the design of stormwater basins is proposed, and a design example is presented. The method is based on the retention of a predetermined fraction of the pollution load leaving a catchment. Holding basin dimensions can be determined given a known runoff volume required to trap a desired mass of pollutants. The parameters are calculated from data which includes a design storm event, the relationship between total runoff volume and total pollutant load, and a loading curve. Though this data is not yet commonly available it may be possible to generalize loading curves for various types of land use with additional research. It is anticipated that the proposed design method could result in smaller holding basins than if designs were based on runoff volume. (Titus-FRC)

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

PLANNING AND DESIGN OF STUDIES FOR RIVER-QUALITY ASSESSMENT IN THE TRUCKEE AND CARSON RIVER BASINS, CALIFORNIA AND NEVADA,
Geological Survey, Carson City, NV. Water Resources Div.
J. O. Nowlin, W. M. Brown, III, L. H. Smith, and R. J. Hoffman.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $10.50 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-435, June, 1980. 75 p, 11 Fig, 14 Tab, 46 Ref.

Descriptors: Evaluation, *Water quality, *River basins, Planning, *Water resources development, Assessments, Water pollution sources, Aquatic environment, Management, Methodology, Mathematical models, Simulation analysis, Land use, California, Nevada, *Truckee River basin(CA-NV), *Carson River basin(CA-NV).

The objectives of the Geological Survey's river-quality assessment in the Truckee and Carson River basins in California and Nevada are to identify the significant resource management problems; to develop techniques to assess the problems; and to effectively communicate results to responsible managers. Six major elements of the assessment to be completed by October 1981 are (1) a detailing of the legal, institutional, and structural development of water resources in the basins and the current problems and conflicts; (2) a compilation and synthesis of the physical hydrology of the basins; (3) development of a special workshop approach to involve local management in the direction and results of the study; (4) development of a comprehensive streamflow model emcompassing both basins to provide a quantitative hydrologic framework for water-quality analysis; (5) development of a water-quality transport model for selected constituents and characteristics on selected reaches of the Truckee River; and (6) a detailed examination of selected fish habitats for specified reaches of the Truckee River. Progress will be periodically reported in reports, maps, computer data files, mathematical models, a bibliography, and public presentations. In building a basic framework to develop techniques, the basins were viewed as a single hydrologic unit because of interconnecting diversion structures. The framework comprises 13 hydrographic subunits to facilitate modeling and sampling. Several significant issues beyond the scope of the assessment were considered as supplementary proposals; water-quality loadings in Truckee and Carson Rivers, urban runoff in Reno and management alternatives, and a model of limnological processes in Lahontan Reservoir. MODEL EVALUATION OF THE HYDROGEOLOGY OF THE MORRIS BRIDGE WELL FIELD AND VICINITY IN WEST-CENTRAL FLORIDA,
Geological Survey, Tallahassee, FL. Water Resources Div.
P. D. Ryder, D. M. Johnson, and J. M. Gerhart
Geological Survey Water-Resources Investigations 80-29, 1980. 92 p, 35 Fig, 2 Tab, 28 Ref.

Descriptors: *Model studies, *Hydrogeology, *Potentiometric level, *Simulation analysis, *Florida, Water wells, Aquifer characteristics, Groundwater movement, Water supply, Groundwater resources, Pumping, *Floridan aquifer, *Morris Bridge well field, West-central Florida.

The Morris Bridge well field in west-central Florida, which is being developed may have a maximum well-field withdrawal of 40 million gallons per day. The water will be pumped from the Floridan aquifer--a sequence of carbonate rocks about 1,100 feet thick underlying surficial sand and clay deposits. A highly fractured and transmissive zone about 500 feet below National Geodetic Vertical Datum of 1929 will supply a large proportion of the water. Two-dimensional and three-dimensional digital flow models were used to evaluate the hydrogeology of the area. The model-derived leakance distribution (a property of the confining bed) for a 285-square-mile area ranged from 0.00002 to 0.008 per day. Model-derived transmissivity values for the Floridan aquifer ranged from 37,000 to 600,000 feet squared per day. Model-derived specific yield values for the surficial aquifer ranged from 0.05 to 0.30. The three-dimensional model was used to predict drawdowns in both the Floridan and surficial aquifers in response to a 40 million gallon per day stress. Mass-balance data from a 30-day simulation with no recharge from rainfall show percentage of withdrawn water that is derived from: (1) aquifer storage, (2) the Hillsborough River, and (3) reduction of evapotranspiration losses. CONSERVATION V. LAND DRAINAGE - A GUIDE FOR THE FUTURE,
Water Space Amenity Commission, London (England).
S. Lucas.
Water, No 34, p 7-10, September, 1980.

Descriptors: *Controlled drainage, *Drainage programs, *Drainage effects, *Wildlife conservation, *Land management, Natural resources, Protection, Compensation, Comprehensive planning, Industries, Engineering, Water policy, Farm management, Governments, Watersheds, Adoption of practices, Grants, Planning, Projects.

The Water Space Amenity Commission's conservation and land drainage guidelines advise on how to minimize environmental damage related to land drainage schemes. They include three sections: advisory notes, practice notes addressing specific environments, and appendices. The guidelines stress regional consultation and are intended for use by industry. Initiated in 1974, they were drafted by experts representing both conservation and drainage interests. The need for drainage and cost benefit analyses is not discussed. In a supplementary report issues such as compensation and areas where scientific research is needed are discussed, and case studies of controversial sites in England and Wales are presented. TEST MONITORING OF PROTOTYPE INJECTION WELL, WAIALE, MAUI, HAWAII,
Geological Survey, Honolulu, HI. Water Resources Div.
R. L. Soroos.
Geological Survey Open-File Report 79-274, January, 1979. 31 p, 7 Fig, 6 Tab, 5 Ref.

Descriptors: *Monitoring, *Injection wells, *Testing, *Hawaii, Pumping, Observation wells, Storm runoff, Groundwater, Water quality, Data collections, Hydrographs, *Maui(HI), Baseline studies, Urban runoff, Water quality control.

A high-capacity prototype injection well was tested in the isthmus area of Maui, Hawaii. Pumping tests were made on April 14 and 15, 1978, and 10 injection tests were made between May 12 and June 30, 1978. Selected tests were monitored in order to obtain data which could be used to assess the effects of subsurface disposal on the ground water in the basal aquifer. Pumping and injection rates were measured. Basal-water head responses to pumping and injection were observed at the prototype well and at two observation wells located 435 and 6,100 feet from the prototype well. Water-quality samples were collected at the prototype well and the nearest observation well prior to testing. Samples of the injection water, as well as samples from the observation wells, were collected prior to and after the final test. The head data and water-quality data are presented in this report. (USGS)
W81-01190

QUALITY OF WATER IN THE BLACK RIVER NEAR DUNN, NORTH CAROLINA, AND GROUND-WATER LEVELS ADJACENT TO THE RIVER PRIOR TO CHANNEL EXCAVATION IN 1976-79,
Geological Survey, Raleigh, NC. Water Resources Div.
C. E. Simmons.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $2.75 in paper copy, $3.50 in microfiche. Geological Survey Open-File Report 80-425, 1980. 18 p, 4 Fig, 4 Tab, 1 Ref.

Descriptors: *Water quality, *Channel improvement, *Streams, *Water levels, *North Carolina, Small watersheds, Flow rates, Storm runoff, Streamflow, Sediment yield, Water temperature, Water analysis, Bacteria, Surface-groundwater relationships, Hydrologic data, *Black River(NC), Baseline studies, Effects, Dredging, *Flood control.

During 1976-79 data were collected at three sites on the Black River, near Dunn, North Carolina, to define water-quality and other hydrologic conditions prior to channel excavation. Samples collected over a range in flow from 1.2 to 900 cubic feet per second contained 1 to 81 mg/L (milligrams per liter) of suspended sediment, 37 to 108 mg/L of dissolved solids, and 0.21 to 1.0 mg/L of total nitrogen. Water-level fluctuations in wells located within 100 feet of the Black River were almost identical with those of the stream. (USGS)
W81-01193

6B. Evaluation Process

WATER RESOURCES RESEARCH COORDINATION AND PLANNING IN THE MISSOURI RIVER BASIN.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-147803, Price codes: A03 in paper copy, A01 in microfiche. Missouri River Basin Region Water Resources Research Institutes Project Completion Report, March, 1978. 35 p. OWRT-B-038-NEB(1), 14-34-0001-7203.

Descriptors: *Water resources planning, *Regional analysis, Water problems, *Groundwater resources, *Groundwater allocation(Policy), *Missouri River basin, Project planning, Financial feasibility.

The main objectives in this project were to: (1) identify and categorize water problems; (2) develop alternatives and regional research proposals for finding their solutions; (3) develop financial plans for research within the region; and (4) provide a means of communication between the institutes for the exchange of ideas on water resources research in the basin. The Missouri River Basin Water Institute Consortium (MRBWIC) selected a particular problem to receive most of its attention. This was the problem of the allocation of the diminishing groundwater supplies in the Basin. MRBWIC worked closely with the Missouri River Basin Commission in conducting a workshop of groundwater allocation and publishing the proceedings. Research needs to make sound decisions on water allocations were developed and the cost of this research estimated.
W81-01003

WASTEWATER TREATMENT PROCESS EVALUATED BY FORCE ACCOUNT,
Montana State Univ., Bozeman.
R. L. Sanks, J. W. Tacke, and J. E. Connell.
Public Works, Vol 111, No 11, p 82-84, November, 1980. 1 Fig.

Descriptors: *Waste water treatment, *Sewage treatment, *Municipal wastes, *Cost-benefit analysis, Pilot plants, Force account, Rotating biological contactor, Filtration, Livingston(MT), Yellowstone River, Montana.

The city of Livingston, Montana, population 8,000, used the force account approach to evaluate a rotating biological contactor which had been proposed as part of a $3.5 million treatment plant expansion. A full-sized rotating contactor was too costly to test. Therefore, 48 four foot diameter discs were tested. Construction of the pilot plant was largely done by city employees. Most of the operation was done by a university student. Although analyses were originally planned to be done by city employees, most procedures were eventually contracted to the university. The pilot plant program, which cost less than $24,000, showed that the surface area of the units should be increased by 10%. Plant operators and city personnel, having been involved with the testing program, readily accepted the new system and accumulated considerable experience for operation of the full-scale plant. (Cassar-FRC)
W81-01086

AN ECONOMIC EVALUATION OF THE FEASIBILITY OF ARTIFICIAL GROUNDWATER RECHARGE IN NEBRASKA,
Nebraska Univ.-Lincoln. Dept. of Agricultural Economics.
R. J. Supalla.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-148066, Price codes: A03 in paper copy, A01 in microfiche. Nebraska Water Resources Center, University of Nebraska, Project Completion Report, January, 1981. 30 p. OWRT-A-065-NEB(1), 14-34-0001-9029.

Descriptors: *Artificial recharge, *Groundwater recharge, Economics, Groundwater management, *Irrigation water, *Economic feasibility, *Nebraska, Cost-benefit analysis, Evaluation.

The purpose of this project was to analyze the economic feasibility of recharge for irrigation use. This involved developing a procedure for estimating recharge benefits, application of the benefit estimating procedure to a proposed Nebraska case, and a review of the literature regarding recharge program costs. The benefit estimating procedure considers two types of benefits: those due to reduced pumping lifts and those due to extended aquifer life. Procedures regarding a minimum amount of data were specified for each of these components. It was found that recharge benefits in irrigation use areas could range from less than $2 to nearly $20 an acre-foot, with the most likely value being in the $15 to $10 range. This range of values reflects different assumptions regarding lift effects, energy prices, farm commodity prices and discount rates. When estimated benefits were compared to available published data on recharge costs, it was found that single-purpose recharge projects to augment water supplies for irrigation would be economically infeasible in most cases. If artificial recharge is to be a viable option, it must be pursued as part of a multi-purpose water development project.
W81-01155

DESIGN OF OBJECTIVE FUNCTIONS FOR RESERVOIR OPERATIONS,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
J. T. Westgate.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-150229, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis, Fall, 1980. 74 p, 42 Ref. OWRT-B-195-COLO(3).

Descriptors: *Reservoirs, Objective functions, *Reservoir operation, Objective change, *Multiple-purpose reservoirs, Reviews, Evaluation, *Optimum development plans.

This research investigates the objective function as a potential weak link in the application of the tools of water resources research to the problems of reservoir operations. Reservoir systems are continually evolving due to changes in the systems' purposes, capabilities, or hydrology. In response to these changes, Reservoir Operations is called upon to evaluate alternative operations policies for their

performance on system objectives. Reservoirs often have multiple purposes, and these purposes have multiple performance measures. A catalog of performance measures found in the water resources literature is presented along with a methodology for selecting the performance measures to be used for the objective function of the analysis.
W81-01169

AGRICULTURE AND HYDRO-POWER: COSTS, BENEFITS, AND TRADE-OFFS,
Oregon State Univ., Corvallis. Dept. of Agricultural and Resource Economics.
F. W. Obermiller.
In: Conflicts Over the Columbia River, Seminar conducted by Water Resources Research Institute, Oregon State University, Corvallis, Spring Quarter 1980. Report SEMIN WR 028-80. July, 1980, p 57-64. 2 Fig, 8 Ref.

Descriptors: *Columbia River, *Hydroelectric power, *Cost-benefit analysis, *Irrigation programs, *Cost comparisons, Unit costs, Income analysis, Cost sharing, Input-output analysis, Energy loss, Income, Return flow, Diversion losses, Agriculture.

It has been predicted that within four to five years, the Columbia River's system-wide water supplies will be fully utilized. Tradeoffs must be considered. One involves the benefits resulting from increases in irrigated agriculture versus the opportunities foregone because of outstream diversion of system waters. There are primary (direct), secondary (indirect), and public benefits and costs as a result of irrigation development. Using price, cost, crop, and acreage projections, the net primary benefits of future irrigation development can be derived. Future primary benefits 'with irrigation' might be $43 million per year, or $220/acre-year. Correcting for higher energy pumping and other costs, the net benefits could be $32/acre-year. The net secondary benefits would increase local non-agricultural household income to the equivalent of $237/acre-year. The net social benefits, the sum of the primary and secondary benefits, should exceed $270/acre-year. However, the value of lost hydroelectric generating capacity must be considered. The calculations given derive an 'opportunity cost' figure of $37.80/acre to replace foregone electric power. Viewed purely from an efficiency standpoint, the Columbia River water has a higher value in irrigation than in hydroelectric power generation. From an equity perspective the verdict is less clear, since the cost of replacing the lost electric power would be borne mostly by people who would not benefit directly from the irrigation. However, if local beneficiaries were to compensate non-local users of electricity, the tradeoff would be both efficient and fair. (Atkins-Omniplan)
W81-01199

NAVIGATION AS AN ALTERNATIVE USE,
Oregon State Univ., Corvallis. Dept. of Agricultural and Resource Economics.
M. V. Martin.
In: Conflicts Over the Columbia River, Seminar conducted by Water Resources Research Institute, Oregon State University, Corvallis, Spring Quarter 1980. Report SEMIN WR 028-80. July, 1980, p 89-107. 1 Fig, 7 Tab.

Descriptors: *Columbia River, *Cost-benefit analysis, *Transportation, *Navigation, Water resources development, Income distribution, Social impact, Economics, Commercial fishing, Barges, Data collections.

Navigational use of the Columbia River's water resources makes a variety of contributions to the economy of the Pacific Northwest. Recent navigation improvements have increased transportation activity on the river. The benefits from commerical navigation arise from on-river downstream movements, off-river movements, upriver movements, capacity availability and developmental influences. On-river barge transportation directly benefits shippers (producers) and ultimately consumers. Low barge rates reduce the delivered price of commodities shipped to upriver areas. Likewise, intermodal competition depresses rail rates. A high-capacity barge system lessens the possibility of a peak period shortage of transportation. Output, employment and income multipliers illustrate how navigation stimulates the economy. There are direct and indirect costs of commercial navigation. Direct costs include construction, maintenance and operation of navigational aids. Indirect costs include foregone energy generation, water loss for irrigation, road damage and damage to the river ecology. Often the direct beneficiaries do not bear the incidence of the associated costs. However, it can be argued that society is served from such subsidies. Tradeoffs to allocate the river's resources have to be made and commercial navigation must be considered along with other uses. (Atkins-Omniplan)

6C. Cost Allocation, Cost Sharing, Pricing/Repayment

WHOLESALE WATER PRICING: A COST-TO-SERVE PLAN THAT WORKS,
K. Grover.
American City and County, Vol 95, No 11, p 65-67, November, 1980.

Descriptors: *Cost allocation, *Water rates, Economics, *Pricing, Cost sharing, Water policy, Cost analysis.

A new financing system put into effect by the Portland, Oregon, Water Bureau has allowed the Bureau to create the revenues it needed to accomplish capital improvement programs and ensure future water stability to the area it serves. The system uses a utility enterprise basis for determining a utility's revenue requirements, a capacity-commodity rate based on cost-to-serve figures, a separate customer service charge, a guaranteed sale of water to all purveyors, a system wherein financing responsibility for new facilities designed to benefit a purveyor or purveyors is assumed by the purveyor(s), and a growth impact charge. Regular monthly meetings are held to avoid any lack of communication problems between the Water Managers' Advisory Board and the Bureau. In place of 10 yr purveyor contracts, Portland has secured 25 yr contracts with all except one of its 42 purveyors. (Baker-FRC)

Descriptors: *Water utilization, *Virgin Islands, *Water distribution(Applied), *Consumptive use, *Water management(Applied), Use rates, Geographical regions, Islands, Regions, Precipitation(Atmospheric), Water sources, Use of water, Potable water, Recreation, Water conservation, Water demand, Water rates, Water resources, Planning, Estimating.

This study was conducted to develop an original data set on the water use pattern for dwelling units occupied by residents and tourists, and to analyze the data to provide per capita demand figures for residential water use in light of increasing water supply costs. Thirteen dwelling units were selected and monitored by the installation of a novel clock-pressure switch water measurement system for a monitoring project that covered 1790 dwelling unit days involving 5900 people days, from November 1979 to July 1980. Major user categories included tourists, residents of island origin, and resident continentals. All but one site were owner operated and none of the units depended on piped/desalted water. Over 90% of the water used was supplied by rainfall. The major conclusion of the study was that high standards of living can be maintained in the U.S. Virgin Islands with an average domestic water usage of less than 40 and perhaps as low as 30 gallons per person per day. Residential water usage can be cut at least in half if the occupants have sufficient economic incentives to conserve water. Residents of island origin are more conservative than residents of continental origin if sufficient financial incentives exist. (Zielinski-IPA)

THE COLUMBIA RIVER: PROTEIN, POWER, PRESERVATION, AND POLITICS,
Haggard, Tousley and Brain, Seattle, WA.
J. E. Haggard.
In: Conflicts Over the Columbia River, Seminar conducted by Water Resources Research Institute, Oregon State University, Corvallis, Spring Quarter 1980. Report SEMIN WR 028-80. July, 1980, p 33-44.

Descriptors: *Columbia River, *Irrigation, *Hydroelectric power, *Hydroelectric power plants, *Anadromous fish, *Consumptive use, Wildlife, Water allocation(Policy), Beneficial use, Federal-state water rights conflicts, Jurisdiction, Local governments, State governments, Planning, Dams

The Columbia River is not just a power resource. It is also used for transportation, flood control, irrigation, recreation, water supply, flow augmentation, fishing, tourism, and habitat for anadromous fish, wildlife and water fowl. With increasing usage, it is evident that existing water supply is not adequate to meet all expected consumptive and instream river uses. Any future commitment of the Columbia's water will involve a cost or tradeoff to some other water use. What is done in one locality affects many others. The use of the river, therefore, requires a system of allocation which recognizes the diversity of interest and demand. A method of dispute resolution is needed that addresses reasonable claims without sacrificing the interests of uninvolved or inactive users. A reasonable accommodation must be made between instream and out-of-stream users, and among users in each category. Future needs should be recognized while realizing that our present perceptions of these needs will vary. A compact between the states and the federal government is desirable; however, political realities may prevent the fruition of an interstate compact for the river in this century. (Atkins-Omniplan)

FISCAL 1980 ANNUAL REPORT TO OFFICE OF WATER RESEARCH AND TECHNOLOGY, USDI.
Pennsylvania State Univ., University, PA. Inst. for Research on Land and Water Resources
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-147811. Price codes: A05 in paper copy, A01 in microfiche. December 1980. 92 p.

Descriptors: *Pennsylvania, Acid mine water, *Information retrieval, *Water supply, *Projects, Water pollution control, Pollutant identification,

Floods, Water quality control, Resources development, Water conservation, Waste treatment, Potable water, Runoff, Erosion, Infiltration, Heavy metals, Streams, Mine drainage, Ecology, *Watershed management, Evaluation, Renovation of wastewater, Technology transfer, Spray irrigation, Nonpoint source pollution, Mound systems, Stream eutrophication, Acid snow.

This publication is the Fiscal 1980 Annual Report of the Water Resources Center, Institute for Research on Land and Water Resources, The Pennsylvania State University. In its reporting of the OWRT funded allotment and matching grant research projects, the report satisfies the reporting requirements of the Office of Water Research and Technology under P.L. 88-379. In addition to the Director's summary statement and a narrative report for each project, the training and education aspects of the Water Research Program under P.L. 88-379 are reported. Numerous broad lines of research are reported with concentrations in the following areas: water supply, water quality management and control, planning for future resource development, water conservation, water utility financing, low flow requirements for in-stream use, nonpoint source pollution, innovative waste treatment, on-site effluent disposal mound system evaluation, study of acid snow, effects of spray irrigation on wildlife, and acid mine drainage. CONCERN OVER THE COLUMBIA ESTUARY,
Pacific Northwest River Basins Commission, Vancouver, WA.
R. Moulton.
In: Conflicts Over the Columbia River, Seminar conducted by Water Resources Research Institute Oregon State University, Corvallis, Spring Quarter 1980. Report SEMIN WR 028-80, July, 1980, p 13-27. 1 Fig, 8 Ref.

Descriptors: *Columbia River, *Washington, *River Basin Commissions, *Estuaries, Watershed protection, Allocation(Cost), Pacific Coast region, Resource allocation, Water resources development, Regional development.

The need to allocate the use of the Columbia River's resources has forced government to plan, make judgements and enforce these judgements through a variety of mechanisms. Except for an investigation by the Atomic Energy Commission in the early 1960's, no comprehensive study of the estuary's resources has been made until recently. To coordinate the efforts of Washington and Oregon, the Columbia River Estuary Study Taskforce (CREST) was formed in 1975. In 1967, the Pacific Northwest River Basins Commission (PNRBC) was established to coordinate water resources activities in the five Pacific Northwest States. One of its purposes was to undertake special studies of water and related land resources. For this reason, the Columbia River Estuary Data Development Program (CREDDP) was initiated. The CREDDP's purpose is twofold: to increase understanding of the Columbia River Estuary as a system, and to acquire information needed for making specific land/water management systems. Funding is provided by Public Works Bill P.L. 95-482. The program will be in seven phases over a six-year period. Policy guidance will be through the PNRBC. Technical guidance will come from a Technical Advisory Committee working through a Program Manager who is on the Committee staff. The work of the program is being performed by a mix of 18 federal/state agencies, academic institutions, and private contractors or individuals working on 28 contracts. Roles, functions and services to be provided by these groups or individuals are described. A summary of the 28 contracts, including dollar amounts, is listed. (Atkins-Omniplan)

EFFECTIVE WASTEWATER MANAGEMENT PLANNING FOR SMALL COMMUNITIES - PART 2,
California Univ., Davis. Dept. of Civil Engineering.
R. F. Barror, and G. Tchobanoglous.
Public Works, Vol 111, No 9, p 125-127, 170, 172, 174, September, 1980. 1 Tab, 8 Ref.

Descriptors: *Management, *Water management(Applied), *Planning, *Waste water treatment, Administration, Comprehensive planning, Design, Systems analysis.

Key innovative wastewater management planning concepts effective for small communities are discussed. The fact that small communities must examine the problems of waste water treatment from a different viewpoint is stressed. Simply scaling down large size operations is not necessarily the best approach. Even though these originally large-scale operations can still function on a small scale, they are often far more costly than a totally new design for a system on a small scale would have been. Innovative planning is needed for the small community. Land and labor utilization must be considered. Three types of water treatment processes which use land either directly or indirectly are ponds (oxidation ponds), land treatment systems (crop irrigation, overland flow and rapid infiltration) and aquatic systems (wetlands and aquaculture applications). Important aspects of land based systems for the small community are described. The effective utilization of labor is considered, including plans to hire unskilled labor through the use of welfare and unemployment funds. (Baker-FRC)

MANAGEMENT AUDITS FOR THE 80'S,
Andersen (Arthur) and Co., Hartford, CT.
E. F. Bader.
Journal of the New England Water Works Association, Vol 94, No 3, p 240-254, September, 1980. 1 Tab.

Descriptors: *Management, *Planning, *Regulation, *Audits, Productivity, Projections, Administrative agencies, Public utilities.

Management audits in utilities by financial and regulatory agencies will increase in the next decade for the following reasons: strong demand for improved economy and efficiency, a high level of consumer activism, emphasis on improved productivity, and pressure on regulatory commissions. The 1980's may see these increasing trends: involvement of commissions in management's decision-making procedures, municipalization, emphasis on documentation to demonstrate efficiency, specialization in scope of audits, and communication with regulatory commissions and the public. Managers may become better prepared for audits by conducting internal reviews, identifying areas for improvement with specific plans for these improvements, reducing exposure in high visibility areas, documenting accomplishments, and communicating actions and plans to the commissions. Specific steps for organizing a pre-audit review are described. (Cassar-FRC)

WATER PROBLEMS AND RESEARCH NEEDS FOR WISCONSIN, A 5-YEAR PLAN,
Wisconsin Univ.-Madison. Water Resources Center.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-150203, Price codes: A06 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, September, 1980. 98 p, 9 Fig, 10 Tab, 22 Ref.

Descriptors: *Research priorities, *Wisconsin, *Planning, *Research and development, *Water quality, Water management(Applied), Water resources, Water pollution, Institutions, Optimum development plans, Evaluation, Programs, Investigations, Project planning, Alternative planning, Water utilization, Toxins, Wetlands, Information exchange, Governments, *Five-year plans.

This report provides an overview of available information on Wisconsin's water resources, shorelands, and water use, and includes a summary of State management and planning activities. This information provided the basis for categorization of problem areas and identification of research needs in development of a five-year plan. Wisconsin's water resources were summarized under: general geology; precipitation and water budget; groundwater (covering quantity, quality and quality management); surface water (rivers/streams, surface water quantity/quality monitoring, inland and Great Lakes); wetlands; shorelands; and water use (river basins, waste water discharges, agriculture, navigation, recreation, fish/wildlife). The identified water research priorities for Wisconsin's five-year plan were developed into eight categories: hazardous materials in the environment; acid precipitation and trace contaminants; nonpoint source pollution; wetlands, recreation; technology transfer, information dissemination, and education program; human health effects; and intergovernmental and intragovernmental activities. The eight identified priority categories were discussed in detail. (Zielinski-IPA)

FIVE-YEAR WATER RESOURCES RESEARCH AND DEVELOPMENT PLAN, FISCAL YEARS 1982-1986.
Rutgers-The State Univ., New Brunswick, NJ. Water Resources Research Inst.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-150195, Price codes: A03 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, December, 1980. 42 p, 6 Fig, 9 Tab, 8 Ref.

Descriptors: *Research priorities, *New Jersey, *Planning, *Research and development, *Water quality, Water management(Applied), Water resources, Water pollution, Institutions, Optimum development plans, Evaluation, Programs, Investigations, Project planning, Alternative planning, Water utilization, Toxins, Chemicals, Storm water, Groundwater, *Five-year plans.

This report has described the current condition of New Jersey's water resources, has identified priority State issues likely to be of major concern during the next five years, and has proposed a research agenda to address priority problems. Twelve State-wide high-priority issues were defined: sewage treatment plant discharges; industrial discharges; landfill dumping; on-site disposal (septic); accidental spills/leaks; urban storm runoff; agricultural runoff/seepage; suburban/rural runoff; purveyor deficits; surface supplies reaching maximum development capacity; fragmentation of water supply network; and groundwater supplies reaching maximum development. Integration of issues identified five broad priority categories: water quality management planning; toxics and hazardous control; groundwater management; nonpoint source control; and point source control. The Institute's three key research priorities, identified by assistance from response to the Institute's questionnaire, represent the proposed research agenda for the next five years: (1) impact of hazardous and/or toxic chemicals on the quality of ground/surface waters; (2) stormwater and nonpoint source management issues; and (3) water quantity issues. Justification and research objectives for these three priorities were discussed. (Zielinski-IPA)

THE ORR DITCH CASE, 1913-1944,
Nevada Historical Society, Reno.
J. M. Townley.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-150286, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Center, University of Nevada, Reno, Desert Research Institute Publication 43007, October, 1980. 90 p, 2 Tab. OWRT-A-080-NEV(1), A-087-NEV(1), 14-34-0001-8030, 14-34-0001-9030.

Descriptors: *History, *Water rights, *Rivers, *Water utilization, *Judicial decision, Riparian rights, River basin development, Biographies, Legal aspects, Water law, Jurisdiction, Bodies of water, Nevada, Institutional constraints, Administration, Water policy, Legislation, Reservation

doctrine, Project planning, Water management(Applied).

The first cooperative report of the Nevada Historical Society and the Desert Research Institute's Water Resources Center describes the results of a project, the objective of which was to make the Orr Ditch case and succeeding litigation understandable in a humanistic sense. Hence, considerable use was made of the term 'equity', and the report has focused on a comparison of the suit's results with the concept of an equitable division of water resources among Truckee River users, rather than legal formalities. This report has also examined the motives and actions of the major parties involved. The case, which arose from the government's need to rectify its management of the Truckee-Carson project, took over three decades (1912-1944) of courtroom argument and detailed field analysis to complete. The final decree (1944) perpetuated earlier findings and contained no significant variance to the Truckee River Agreement of 1935. From experience of the Orr Ditch suit, this report concluded that, once finite water rights are identified, they must be enforced by an agency that is free of influence of water users, and that will distribute resources statutorily; otherwise a regulatory decree quickly becomes nonfunctional. (Zielinski-IPA)

PLANNING FOR FISCAL YEARS 1982/1986.
Delaware Univ., Newark. Water Resources Center.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-150260, Price codes: A05 paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, November, 1980. 83 p, 6 Fig, 9 Tab, 15 Ref, 2 Append.

Descriptors: *Research priorities, *Delaware, *Planning, *Research and development, *Water quality, Water management(Applied), Water resources, Water pollution, Institutions, Optimum development plans, Evaluation, Programs, Investigations, Project planning, Alternative planning, Water utilization, Toxins, Groundwater, Delaware River, Bays, *Five-year plans.

This five-year report covered State geological information (aquifers, surface water, climate, land use), water quality and use, governmental and other agencies and their anticipated fiscal year 1981 activities, Delaware's water problem categories, and has identified research priorities. The five-year plan was presented in two forms: (1) the foreseeable immediate future and factors that will guide the State water resources Center's decisions; and (2) a fiscal breakout for the five-year plan. Identified Delaware water problems were discussed under water resources planning/management, water supply (including distribution systems and quality), groundwater contamination, and waste treatment/disposal categories. Thirteen research priorities were classified as either critical, urgent, or important. Critical area priority categories were: atmospheric, hydrologic, and hydraulic processes (groundwater contamination from landfill/waste disposal sites; predictive subsurface contaminant migration study); water resources management (economics study for water conservation program for public/industrial/agricultural sectors); and institutional, political, legal, behavioral, and economic analysis (evaluation of up-river management effects on Delaware River and Bay in Delaware). (Zielinski-IPA)
W81-01163

FIVE-YEAR WATER RESOURCES RESEARCH AND DEVELOPMENT PLAN, FISCAL YEARS 1982-1986,
Ohio State Univ., Columbus. Water Resources Center.
R. L. Vertrees, and R. C. Stiefel.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-150211, Price codes: A04 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, October, 1980. 59 p, 3 Fig, 5 Tab, 71 Ref.

Descriptors: *Research priorities, *Ohio, *Planning, *Research and development, *Water quality, Water management(Applied), Water resources, Water pollution, Institutions, Optimum development plans, Evaluation, Programs, Investigation, Project planning, Alternative planning, Water utilization, Toxins, Flooding, Drainage, *Five-year plans.

Adequate water is available from precipitation, the Ohio River and Lake Erie to meet Ohio's immediate needs. Most of Ohio's water-related problems are associated with water quality. Large quantities of waste products are produced from point/diffuse sources, developing concerns in surface runoff from urban, agricultural and mining areas over the State. The potential contamination of groundwaters by toxic/hazardous wastes represents a critical water resources problem. Other major water-related problems include: impact assessment of water development projects on wetlands/recreational activities; quantification of instream flow needs to maintain aquatic organism species diversity; and impact assessment of acid precipitation on State stream/lake water quality. Ten identified problem areas were prioritized in developing the State's five-year water resources research and development plan: (1) pollution from diffuse sources (agricultural/urban runoff, mine drainage, on-site disposal); (2) drinking water contamination (surface/ground water); (3) toxic/hazardous waste disposal (land disposal, ground/surface water); (4) point source pollution; (5) impacts of flooding/drainage; (6) impacts of water resources development; (7) instream flow needs; (8) impacts of synthetic fuel development; (9) air pollution impacts; and (10) water supply allocation. INTERNATIONAL MANAGEMENT OF THE COLUMBIA,
Oregon State Univ., Corvallis. Dept. of Geography.
K. W. Muckleston.
In: Conflicts over the Columbia River, Seminar conducted by Water Resources Research Institute, Oregon State University, Corvallis, Spring Quarter 1980, Report SEMIN WR 028-80. July, 1980, p 69-88. 4 Fig, 2 Tab, 26 Ref.

Descriptors: *Columbia River, *Canada, *International waters, *Treaties, Hydrographs, Hydroelectric power, Reservoirs, Storage capacity, Irrigation, Streamflow, Flood control, Dams, Drainage basins, Pumped storage, Water policy.

An agreement between the United States and Canada for the cooperative management of the Columbia River was developed over two decades, involving the provision and operation of storage reservoirs in Canada. By the early 1950's, it was evident that utilities in the Pacific Northwest would have difficulty meeting the growing peak demands for electrical energy during the fall and winter seasons. Shortfalls in the planned additional increments of upstream storage were at the root of the problem. In 1959, after fifteen years of study, the International Joint Commission presented alternative plans for development, noting that storage sites in Canada could be operated to the benefit of both countries. The Commission also calculated an apportionment of the costs/benefits to each country. Before implementation, the U.S. had to agree to benefit sharing: an equal division between the upstream and downstream countries of benefits that accrue in the downstream country as a result of storage in the upstream country. Quantifying the downstream benefits was complex, however, an agreement was reached in 1960 and the Columbia River Treaty was signed in 1961. The Protocol finalizing the Treaty was signed in 1964 after Canadian factions reached agreement on their distribution of the benefits. The Treaty's main water-related concerns were hydroelectric generation and flood mitigation. Which country benefited most is debatable but both received large blocks of electrical energy at a lesser cost than if developed independently. Future negotiations will consider flow augmentation, water quality enhancement, irrigation and recreation. (Atkins-Omniplan)

OFFSHORE WATER INTAKES DESIGNED TO PROTECT FISH,
Stone and Webster Engineering Corp., Boston, MA. Hydrology Div.
Y. G. Mussalli, E. P. Taft, and J. Larsen.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 106, No Hy 11, p 1885-1901, November, 1980. 9 Fig, 21 Ref.

Descriptors: *Hydraulic structures, *Fish barriers, *Water cooling, Fish harvest, Fish passages, Intakes, Fish behavior, Fish repellents, Infiltration, Environmental effects, Screens, Saline water fish, Sea water.

Cooling water intake structures situated at offshore locations frequently face problems of impingement and entrainment of fish. Not only does the entrapment of fish deter efficient water intake, but the loss of fish may affect future fish harvests and endanger populations of certain marine habitats. Five concepts to prevent the entrance of fish into cooling water intake equipment are reviewed to familiarize designers with the advantages and problems associated with each. The systems discussed include velocity caps, wide-spaced louvers, behavioral barriers, wedge-wire screens and infiltration intakes. Radial wells and wedge-wire screens are the most effective in preventing fish impingement; however, more work is needed for use of wedge-wire screens in once-through cooling systems. Behavioral barriers offer only limited prevention of fish entrainment. More research is also needed on the wide-spaced louver concept to make it a viable method of bypassing fish within offshore, velocity cap intakes. (Geiger-FRC)

U.S. GEOLOGICAL SURVEY ACTIVITIES IN NEW YORK, 1979.
Geological Survey. Albany, NY. Water Resources Div.
Geological Survey Open-File Report 80-51, 1980. 124 p, 9 Fig, 2 Tab, (Finch, A., and Gori, P., compilers).

Descriptors: *New York, *Natural resources, *Projects, *Programs, Water resources, Land use, Mineralogy, Fuels, Water quality, Geologic investigations, Mapping, Energy, Bibliographies, *U.S. Geological Survey.

This report describes the work of the U.S. Geological Survey and summarizes projects conducted in New York during 1979. Many of these projects are continuing into the 1980's. The major programs provide basic scientific information concerning water, land, and mineral resources. The Survey also supervises the exploration for mineral fuels on leased outer continental shelf lands. The programs are: (1) Water resources investigations--These encompass (a) statewide networks of measurement stations that provide continuous records of streamflow, groundwater levels, water quality, and sediment discharge, and (b) projects to study local or regional water problems as well as critical water problems of national scope or interest. (2) Geologic and mineral resource surveys and mapping--These studies focus on geologic, mineral, and energy-resources investigations both on land and offshore. (3) Conservation of lands and mineral resources--These studies include the classification and evaluation of mineral resources on the outer continental shelf. (4) Topographic surveys and mapping--These studies include quadrangle, small-scale, and special mapping. (5) Land information and analysis--These studies focus on the interpretation and application of earth-science and related information to multi-disciplinary land-resource and environmental-impact problems. HYDROLOGIC INVESTIGATIONS IN THE ARAGUAIA-TOCANTINS RIVER BASIN (BRAZIL),
Geological Survey, Ocala, FL. Water Resources Div.
L. J. Snell.
Available from the OFSS, USGS Box 25425, Fed. Ctr., Denver, CO 80225, Price: $4.25 in paper copy, $4.50 in microfiche. Geological Survey Open-File Report 79-1599, 1979. 28 p, 5 Fig.

Descriptors: *Water resources development, *Networks, *River basins, Hydrologic data, Meteorological data, Gaging stations, Stream gages, Rain gages, *Brazil, *Rio Araguaia, *Rio Tocantins, *Project planning.

The Araguaia-Tocantins River basin system of central and northern Brazil drains an area of about 770,000 square kilometers and has the potential for supporting large-scale developments. During a short visit to the headquarters of the Interstate Commission for the Araguaia-Tocantins Valley and to several stream-gaging stations in June 1964, the author reviewed the status of the streamflow and meteorological data-collection programs in relation to the streamflow and meteorological data-collection programs in relation to the pressing needs of development project studies. To provide data for areal and project-site studies and for mainstream sites, an initial network of 33 stream gaging stations was proposed, including the 7 stations then in operation. Suggestions were made in regard to operations, staffing and equipment. Organizational responsibilities for operations were found to be divided uncertainly. The Brazilian Meteorological Service had 15 synoptic stations in operation in and near the basin, some in need of reconditioning. Plans were at hand for the addition of 15 sites to the synoptic network and for limited data collection at 27 other sites. The author proposed collection of precipitation data at about 50 other locations to achieve a more representative areal distribution. Temperature, evaporation, and upper-air data sites were suggested to enhance the prospective hydrometeorological studies. (USGS)

7B. Data Acquisition

REMOTELY SENSED CROP TEMPERATURE FOR WATER RESOURCES MANAGEMENT,
Nebraska Univ.-Lincoln. Center for Agricultural Meteorology and Climatology.
B. L. Blad.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-147795, Price codes: A12 in paper copy, A01 in microfiche. Nebraska Water Resources Center, University of Nebraska, Project Completion Report, November, 1980. 247 p, 87 Fig, 18 Tab, 121 Ref, 4 Append. OWRT-B-044-NEB(2), 14-34-0001-8097.

Descriptors: *Crop temperature, Water stress, Irrigation scheduling, *Remote sensing, Evapotranspiration, *Crop response, *Temperature, Crop production, Forecasting, Irrigation practices, Water management(Applied).

The overall goal of the project was to evaluate the use of crop temperature data as a tool in the management of water resources. The specific objectives of the study were: (1) to determine the crop temperature response of some major agronomic crops to various levels of water stress; (2) to test methods based on crop temperature or other remotely sensed data to estimate crop water stress conditions and to evaluate the utility of these methods for their ability to estimate crop yields, severity of water stress and crop phenological development; and (3) to determine the feasibility of using crop temperature as a guide for irrigation scheduling. Crop temperatures were measured with an infrared thermometer, with attached leaf thermocouples and with airborne multispectral scanners. Corn and sorghum were the principal crops studied. Some data were also obtained for soybeans and alfalfa. Results of the studies suggest that crop temperature data can be used to assess crop water status. As such, crop temperature data can be used for scheduling irrigation, for detecting and monitoring effects of limited availability of water to crops, for evaluating the effectiveness of various irrigation scheduling techniques, for examining the uniformity of water application by various irrigation systems, for detecting soil areas with low water holding capacities, and as a means to select plant types which are most effective in tolerating or avoiding shortages of water.

PROGRAM LAYOUT - AN INTERACTIVE PROGRAM TO HANDLE PAGE LAYOUT FOR DOCUMENTATION OF COMPUTER FILES PRINTED ON-LINE AT REMOTE TERMINALS,
National Hydrology Research Inst., Calgary (Alberta).
W. C. Horwood, and K. U. Weyer.
NHRI Report No 9, 1980. 60 p, 9 Tab, 5 Append.

Descriptors: *Computer programs, *Remote terminals, LAYOUT, Automatic printout, *Documentation, Program listings, Program outputs, Hydrologic data, *Publications, *Information retrieval, Programs.

The documentation of program listings and program outputs for reports and publications is a tedious and time consuming procedure subject to errors. It is best done automatically using the files and the facilities of the computer itself. Computer files, however, are generally stored as continuous streams of information. Printing of these files at terminals produces continuous and unstructured listings, which are very laborious to read. In theory, the final structure of the listings and the layout of the printing faces can be fully anticipated at the time of programming. This, however, has proven to be a complicated, cumbersome and time-consuming procedure. All of these disadvantages can be efficiently overcome by using a general purpose program to structure automatically for printing by the computer any computer listing, program input or output stored on magnetic files. To the best knowledge of the authors, program LAYOUT is the first general program of this kind. The design of the page layout for the final printing is prepared interactively at a remote terminal. Automatic printing of the final structured file is also routed to remote terminals to avoid some of the disadvantages of main printers of computers such as their automatic response to formatting commands often included in program output. Descriptors: *Logging(Recording), *Borehole geophysics, *Water quality, *Electric well logging, *Radioactive well logging, Aquifer characteristics, Carbonate rocks, Resistivity, Porosity, Analytical techniques, Evaluation, Montana, North Dakota, South Dakota, Wyoming, Apparent water resistivity.

The water quality in carbonate aquifers can be determined by analysis of resistivity and porosity logs. When supporting data from water analyses are available, the value of the cementation exponent m can be determined more precisely. Data for this study were taken from logs of oil-test wells, Amstrat sample studies, drill-stem tests and water test wells in parts of Montana, North and South Dakota, and Wyoming. The preferred resistivity curves for apparent water resistivity (Rwa) analyses are the deeply focused laterolog and the induction log. The standard electric log can be used if the drilling mud is not saturated with salt. The preferred porosity logs are the sonic, sidewall neutron, compensated neutron, and the density logs. Older, uncalibrated neutron curves can be empirically calibrated in some instances, however, resulting porosities are frequently anomalous when compared to those determined from core or modern logs. When apparent water resistivity is determined for many wells, the data can be plotted and contoured to outline areas of recharge, direction of probable ground-water movement, and location and salinity of brine areas. AERIAL INFRARED PHOTOGRAPHY FOR FLOOD PLAIN INVESTIGATIONS,
Institute of Hydrology, Wallingford (England).
K. Blyth, and G. P. Nash.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 5, p 425-434, 1980. 4 Fig, 1 Tab, 10 Ref.

Descriptors: *Flood profiles, *Aerial photography, *Infrared radiation, Flood data, Mapping, Films, Color, Thames River(England).

Flood mapping from low-cost aerial photographs reduces demands on staff resources, improves the quality and quantity of flood data, and provides a visual record of the flood plain. Light aircraft is used and both vertical and oblique photographs are taken with 35 mm cameras. The effectiveness of the system was evaluated in a series of flights over

the flooded Thames in February 1977, and in a study of the Rivers Lee and Roding upper catchments in May 1978. The total cost of the Thames project was 6.25 British Pounds Sterling per km including interpretation and mapping. The oblique, color infrared aerial photographs, taken up to a week after maximum flood extent, were an effective method of mapping maximum flood extent. (Small-FRC)

DEVELOPMENT OF A MODEL FOR ESTIMATING THE EXTENT OF RIVER FLOODING WITH SATELLITE AND IN SITU DATA,
Cornell Univ., Ithaca, NY. School of Civil and Environmental Engineering.
W. R. Philipson, J. N. McLeester, and W. R. Hafker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-152035, Price codes: A05 in paper copy, A01 in microfiche. Project Technical Completion Report, November, 1980. 26 p, 7 Fig, 3 Tab. OWRT-A-089-NY(1), 14-34-0001-0134.

Descriptors: *Remote sensing, *Satellites(Artificial), *Flood forecasting, Data processing, *Model studies, River basins, Aerial photography, Photogammetry, New York, *Black River basin(NY), *Landsat, *Multispectral scanner data, *Image analysis.

The value and use of Landsat satellite data for obtaining information on flooding were assessed in this study of the Black River Basin in northern New York. The investigation had three parts. Initially, the reliability of delineating flood-affected areas from Landsat data was established by comparison with flood boundaries derived from aerial photographs of a different but similar flood. Secondly, it was established that the delineation of flood-affected areas could be performed through visual analysis of band 7 (near-infrared) Landsat images as reliably as it could through color-additive viewing or digital analysis using all Landsat bands or scenes of different dates (flooding and no flooding). Lastly, a preliminary predictive model was developed which uses in situ measurements of river discharge to estimate the extent of flooding. This model was derived by statistically relating in situ measurements of discharge to Landsat-derived measurements of the area and location of flooding.

WATER RESOURCES DATA FOR MONTANA, WATER YEAR 1979.
Geological Survey, Helena, MT. Water Resources Div.
Geological Survey Water-Data Report MT-79-1, July, 1980. 842 p, 10 Fig, 5 Tab.

Descriptors: *Montana, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water resources data for the 1979 water year for Montana consist of records of stage, discharge, and water quality of streams; stage, contents and water quality of lakes and reservoirs; and water levels in wells. This report contains discharge records for 226 gaging stations; stage only records for 1 lake station; stage and contents for 9 lakes and reservoirs; water quality for 137 stations, 3 lakes; and water levels for 23 observation wells. Also included are 172 crest-stage partial-record stations and 43 smaller reservoirs. Additional water data were collected at various sites, not part of the systematic data-collection programs, and are published as miscellaneous measurements. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State and Federal agencies in Montana. (USGS)

WATER RESOURCES DATA FOR PUERTO RICO, WATER YEAR 1977, SURFACE AND QUALITY-OF-WATER RECORDS AND GROUND WATER RECORDS.
Geological Survey of Puerto Rico, San Juan. Water Resources Div.
Geological Survey Water-Data Report PR-77-1, July, 1980. 204 p, 19 Fig, 3 Tab, 25 Ref.

Descriptors: *Puerto Rico, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites.

Water-resources data for surface-water, quality-of-water, and ground-water records for 1977 water year for Puerto Rico consist of records of discharge, water quality of streams, and water levels of wells. This report contains discharge and water-quality records for 35 gaging stations, 74 water-quality stations, and water levels for 58 observation wells. Also included are data for 17 crest-stage partial-record stations. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and the Commonwealth of Puerto Rico. (USGS)

WATER RESOURCES DATA FOR PENNSYLVANIA, WATER YEAR 1979--VOLUME 1. DELAWARE RIVER BASIN.
Geological Survey, Harrisburg, PA. Water Resources Div.
Geological Survey Water-Data Report PA-79-1, September, 1980. 297 p, 12 Fig, 3 Tab

Descriptors: *Pennsylvania, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Delaware River basin(PA).

Water resources data for the 1979 water year for Pennsylvania consist of records of discharge and water quality of streams, contents of lakes and reservoirs, and water levels of ground-water wells. This report, Volume 1 (Delaware River basin), contains records for water discharge at 73 gaging stations, contents at 11 lakes and reservoirs, water quality at 39 gaging stations and water levels at 16 observation wells. Also included are data for 43 crest-stage, 28 low-flow, and 43 water-quality partial-record stations. Additional water data were collected at various sites not involved in the systematic data-collection programs and are published as miscellaneous measurements and analyses. These data together with the data in Volumes 2 and 3 represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State, local, and Federal agencies in Pennsylvania. GEOLOGY AND GROUND WATER IN NORTH-CENTRAL SANTA CRUZ COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, CA. Water Resources Div.
M. J. Johnson.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113243, Price codes: A03 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-26, September, 1980. 33 p, 7 Fig, 3 Tab, 37 Ref.

Descriptors: *Groundwater potential, *Aquifer characteristics, *Groundwater availability, *Water quality, *California, Hydrogeology, Geohydrologic units, Test wells, Groundwater recharge, Evaluation, *Santa Cruz County(CA).

North-central Santa Cruz County is underlain mainly by folded sedimentary rocks of Tertiary and Cretaceous age that have been highly fractured by movements in the San Andreas fault system. Ground water is stored in fractures within shale and mudstone formations and in intergranular pore spaces within fine- to very fine-grained sandstone and siltstone formations. Fewer than 10% of the wells yield more than 15 gallons of water per minute. The water in most wells is moderately hard to very hard, is generally of a sodium bicarbonate or calcium bicarbonate type, and commonly has excessive concentrations of iron or manganese. Of the many geologic units in the study area, only the Purisima Formation of Pliocene age has the potential to sustain well yields greater than 100 gallons per minute. (USGS)

WATER RESOURCES DATA FOR WASHINGTON, WATER YEAR 1979--VOLUME 1. WESTERN WASHINGTON.
Geological Survey, Tacoma, WA. Water Resources Div.
Geological Survey Water-Data Report WA-79-1, October, 1980. 433 p, 22 Fig.

Descriptors: *Washington, *Hydrologic data, *Surface waters, *Groundwater, *Water quality, Gaging stations, Streamflow, Flow rates, Sediment transport, Water analysis, Water temperature, Chemical analysis, Lakes, Reservoirs, Water wells, Water levels, Data collections, Sites, *Western Washington.

Water Resources data for the 1979 water year for Washington consist of records of stage, discharge, and water quality of streams; stage, contents, and water quality of lakes and reservoirs; and water levels and water quality of ground-water wells. This report in two volumes contains records for water discharge at 237 gaging stations, stage only at 5 gaging stations, stage and contents at 43 lakes and reservoirs, water quality at 135 gaging stations (including 6 lakes and reservoirs) and 100 wells, and water levels at 164 observation wells. Also included are data for 88 crest-stage, and 89 water-quality partial-record stations. Additional water data were collected at various sites not involved in the systematic data-collection program and are published as miscellaneous measurements and analyses. These data represent that part of the National Water Data System operated by the U.S. Geological Survey and cooperating State, local, and Federal agencies in Washington. (USGS)

A STATISTICAL ANALYSIS OF THE QUALITY OF SURFACE WATER IN NEBRASKA,
Geological Survey, Lincoln, NE. Water Resources Div.
R. A. Engberg.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-227895, Price codes: A13 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-43, June, 1980. 277 p, 14 Fig, 9 Tab, 19 Ref.

Descriptors: *Water quality, *Surface waters, *Chemical analysis, *Biological properties, *Nebraska, Streamflow, River basins, Sampling, Sites, Water analysis, Equations, Regression analysis, Correlation analysis, Specific conductivity, Planning, Water quality control.

This report provides descriptive statistics for 29 chemical or biological constituents for 109 stream sites in Nebraska sampled by the U.S. Geological Survey beginning in 1946. Also provided for each site are regression equations relating specific conductance to each of 12 chemical constituents and a regression equation relating specific conductance to stream discharge. The descriptive statistics are presented by river basins. Water leaving these basins that has the lowest mean specific conductance (266 umho/cm) is from the Niobrara River at Verdel, and water that has the highest (1,890 umho/cm) is from the South Platte River at Roscoe. Statewide, the principal cations in streamflow are calcium and sodium, and the principal anions are bicarbonate and sulfate. Calcium and bicarbonate usually predominate where mean specific conductance is less than 1,000 umho/cm, and sodium and sulfate predominate where the mean exceeds 1,000 umho/cm. Based on regression equations, dissolved solids, hardness, calcium, magnesium and bicarbonate, with some exceptions, correlate well with specific conductance for all stream sites. Illustrations of how regression equations may be used to estimate water quality of streamflow are given and are compared with values from actual analyses. (USGS)

GROUND-WATER LEVELS IN NEW MEXICO, 1977,
Geological Survey, Albuquerque, NM. Water Resources Div.
J. D. Hudson.
New Mexico State Engineer Basic Data Report, 1980. 131 p, 35 Fig, 56 Tab.

Descriptors: *Groundwater resources, *Observation wells, *Water level fluctuations, *Water utilization, *New Mexico, Hydrologic data, Basic data collections, Aquifers, Bibliographies, Groundwater, Publications.

Water levels are measured periodically in a network of about 5,000 observation wells to record changes in groundwater storage. About 1,000 wells are measured annually and the remaining 4,000 wells are scheduled to be measured at 5-year periods, staggered so that a portion are measured each year. The areas of water-level observation are within seven of the nine major surface-water drainage basins; most are in areas where groundwater is used in large quantities for irrigation, municipal, or industrial purposes. Water-level measurements were made in January or February 1978. Intensive-coverage measurements were made in the Animas and Lordsburg valleys, Playas basin, and Carlsbad area. Tables of water-level data for these areas show change in water levels for 1973-78. Maps showing 5-year water-level changes for the four areas are also included. A bibliography of papers and publications pertaining to groundwater in New Mexico and adjacent areas published or released to the open file in 1977, with additions from 1848-1976 is included. (USGS)
W81-01181

WATER-QUALITY MONITORING OF THREE MAJOR TRIBUTARIES TO THE CHESAPEAKE BAY--INTERIM DATA REPORT,
Geological Survey, Towson, MD. Water Resources Div.
D. J. Lang, and D. Grason.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-113888, Price codes: A05 in paper copy, A01 in microfiche. Geological Survey Water-Resources Investigations 80-78, September, 1980. 66 p, 1 Fig, 5 Tab, 9 Ref.

Descriptors: *Water quality, *Basic data collections, *Water analysis, *Rivers, *Chesapeake Bay, Bays, Sampling sites, Sediment transport, Sediments, Bottom sediments, Nutrients, Trace elements, Pesticides, Herbicides, Insecticides, Potomac River, James River(VA), Susquehanna River(MD).

The U.S. Geological Survey is monitoring the water quality of three major tributaries to the Chesapeake Bay at their fall lines in order to obtain estimates of constituent inputs potentially available to the Bay. The monitoring sites are: Susquehanna River at Conowingo, MD.; Potomac River at Washington, DC.; and James River at Cartersville, VA. Water-quality data collected from October 1978 to April 1980 are presented in tabular format. Concentrations of major ions, nutrient and carbon species, metals, pesticides, suspended sediment, and other selected constituents are presented for a range of flows. The mean, standard deviation, minimum, maximum, and median values for each constituent were determined by standard methods and are presented for each sampling station. Bivariate linear regressions were run for all constituents versus streamflow, specific conductance, and suspended sediment. Those relationships exhibiting coefficients of determination greater than 0.50 are tabulated. (USGS)

MAPS SHOWING SATURATED THICKNESS, JANUARY 1979, AND PERCENTAGE DECREASE IN SATURATED THICKNESS, 1950-79, OF UNCONSOLIDATED AQUIFER, WEST-CENTRAL, KANSAS,
Geological Survey, Garden City, KS. Water Resources Div.
M. E. Pabst.
Geological Survey Open-File Report 79-1340, December, 1979. 3 p, 2 Plates, 5 Ref.

Descriptors: *Maps, *Unconsolidated aquifers, *Kansas, Groundwater, Aquifer characteristics, Water wells, Water yield, Irrigation, Water levels, Withdrawal, *West-central Kansas, *Ogallala Formation, Saturated thickness.

The principal water-yielding formation (unconsolidated aquifer) supplying water to wells in west-central Kansas is comprised of the Ogallala Formation and undifferentiated Pleistocene deposits. About 1,860 square miles of the area are underlain by sufficient saturated material to supply groundwater for irrigation. Saturated thickness in the area ranges from less than 50 feet to about 270 feet. Thickness of saturated deposits in the unconsolidated aquifer in west-central Kansas has decreased as a result of groundwater withdrawals, principally for irrigation. From 1950 to 1979, the decrease in saturated thickness was negligible in some areas and as much as 80 feet in other areas. The decrease, in a few areas, was nearly an 80% reduction of the initial (1959) saturated thickness. (USGS)

Water and Waste Treatment, Vol 23, No 8, p 26, 29, August, 1980.

Descriptors: *Construction materials, *Materials engineering, *Specifications, *Construction, *Fabrication, *Design data, *Structural shapes, Technology, Design standards, Tunnel linings, Costs, Dimensions, Structural steel, Structural analysis, Water tanks, Pipelines, Sewage treatment, Industrial water.

Vessels used for water production, effluent treatment and for other industrial purposes are now being designed and manufactured from a variety of materials to meet specific requirements for modular treatment plants. The basic materials used for tanks are mild steel, stainless steel, aluminum, titanium, glass reinforced resins, and thermoplastics. A variety of lining materials suitable for each tank are also available. Equipment to treat and control industrial effluent is available from separate commercial manufacturers. Commercial contracts for the design and installation of a modular water production plant and an effluent treatment plant are described. Modular treatment plants have wide application; they are efficient, fabricated in suitable materials, and readily available from commercial manufacturers. (Titus-FRC)

NEW WAYS TO FIX LEAKY SEWERS,
RJN Environmental Associates, Inc., Wheaton, IL.
R. E. Nelson.
American City and County, Vol 95, No 9, p 39, 40, 42, September, 1980.

Descriptors: *Sewers, *Repairing, Manholes, Pipes, *Maintenance, Infiltration, Rates, Sliplining, Materials.

A rehabilitation program undertaken in Streamwood, Illinois to update the sewage system called for sliplining 1546 feet of 24-inch diameter sewer, rehabilitating 991 out of 1154 manholes in the system, grouting leaky sewer lines, replacing cracked sewer lines, and disconnecting 850 private sector sources of inflow. These procedures have largely been completed with a resulting 50 to 70% reduction in infiltration/inflow. Sewer backups are greatly reduced, and building permits in the community are no longer restricted. Most of the system's 255,000 lineal feet of sanitary sewer were vitrified clay pipe. About 80% of the 1154 manholes were precast concrete, and the rest were concrete block. The replaced 1546 feet of pipes were severely cracked due to root intrusion through defective joints and other factors. Sliplining was performed using a polyethylene pipe with an outside diameter of 22.05 inches and a wall thickness of 1.248 inches. To replace and reseal the frame grade adjustments to manholes, the manhole was hand excavated to the cone section. Frame and grade adjustments were removed and the surface of the cone section was cleaned for preparation of a gasket material. A flexible rubber-like gasket was placed around the entire circumference of the cone section at about the midpoint of the wall. Precast concrete ring grade adjustment of the frame was placed on top of the gasket material, forming a water-tight seal. (Baker-FRC)

PILOT SCALE EVALUATION OF PHYSICAL-CHEMICAL WASTEWATER TREATMENT SYSTEM FOR COMBINED SEWER OVERFLOWS.
Pollutech Pollution Advisory Services Ltd., Oakville (Ontario).
Environmental Protection Service, Ottawa, Ontario, Canada. Canada-Ontario Agreement on Great Lakes Water Quality Research Report No 36, 1976. 96 p, 27 Fig, 29 Tab, 19 Ref.

Descriptors: *Sewerage, *Wastewater treatment *Sewer outfalls, Microstrainers-ozonation system, Stormwater drainage, Dry weather flow, Hydraulic loading, *Great Lakes, Water quality, Physical-chemical treatment, *Sewer overflows, Design criteria.

This report describes a pilot scale investigation of the feasibility of using coarse screening, microscreening, and ozonation for the treatment of combined sewer overflows. The pilot scale system consisted of a Crane-Cochran Microstrainer with 23 micron screen openings and an ozone generator. During the first part of the study, the pilot unit was installed at the West Oakville Water Pollution Control Plant. The dilute waste concentrations anticipated in combined sewer overflows were simulated by diluting raw sewage with tapwater. The contaminants measured were BOD, total organic carbon, suspended solids, total phosphorus, oil and grease, and total coliforms. The effects of waste strength and hydraulic loading were studied by varying the dilution of the raw waste and controlling the throughput of the unit. (WATDOC)

FISH MANAGEMENT AND PROTECTION,
Oregon Department of Fish and Wildlife, Portland.
F. R. Young.
In: Conflicts Over the Columbia River, Seminar conducted by Water Resources Research Institute, Oregon State University, Corvallis, Spring Quarter 1980. Report SEMIN WR 028-80, July, 1980, p 29-32.

Descriptors: *Columbia River, *Fish management, *Fish migration, *Aquatic habitats, *Fish hatcheries, Dams, Spawning, Dam sites, Rainbow trout, Salmonids, Diversion structures, Water management(Applied).

The decline of salmon and steelhead in the Columbia River can be linked with man's industrially based economy, which is in direct competition with the habitat requirements of these fish. Logging and streamside road-building have produced siltation of spawning beds, low summer stream flows and high temperatures from lack of streamside cover. All reduce the streams' productivity. Main-stem dams have blocked large areas of the Columbia and changed it from a free-flowing river to a series of lakes. Problems associated with these dams include a delay in migration due to a slowing of the river, predation as a result of increased exposure time, and residualism wherein the fish will not arrive at the ocean when they are physiologically prepared to and thus remain in the reservoirs. The loss of adults may exceed 20% at some dams with juvenile loss even higher. Resource management agencies are waging a battle to save the fish runs. The logging industry is using buffer strips and restricting road-building along streams as well as using helicopters to log steep areas. Grazing allotments have been reduced on public lands and a few streams have been fenced to prevent livestock abuse. Irrigation diversions have been screened to keep downstream migrants from becoming fertilizer for farmer's crops. The Corps of Engineers has also spent millions on bypass systems at main-stem Columbia and Snake River dams. With these and other improvements, the runs can probably survive until hatcheries can be brought into full production over the next 10 to 20 years. (Atkins-Omniplan)

MANUAL OF PRACTICE ON URBAN DRAINAGE.
Environmental Protection Service, Ottawa (Ontario). Water Training and Technology Transfer Div Canada-Ontario Agreement on Great Lakes Water Quality Research Report No 104, 1980. 326 p, 67 Fig, 48 Tab, 71 Ref.

Descriptors: *Urban drainage, *Water quality, *Water pollution effects, *Sewage systems, Drainage systems, Surface runoff, Flow characteristics, Source controls, Storage facilities, Storm water management, Treatment facilities, Evaluation, Administration, Controls, Laws, *Great Lakes, Planning, Design criteria, Urban drainage manual.

This manual presents planning and design concepts, analytical and design methodologies, and technological alternatives for prevention and abatement of problems related to the quantity and quality of storm runoff from developed urban areas and areas undergoing urban development. Solutions to these problems are identified and depend on planning, design, and operation of sanitary, storm, and combine sewage systems. This manual is not a 'design manual' containing the information needed to plan and design urban drainage systems Rather, it is intended as a presentation of the concepts which can be used to derive solutions to the problems. The manual consolidates the research and development findings of the Urban Drainage Subcommittee program of the Canada-Ontario Agreement as well as information from other Canadian programs and work conducted in other countries, especially the United States, related to storm and combined sewage control. This manual addresses the following specific objectives: To identify the seriousness of urban drainage problems; to identify and describe new effective solutions to urban drainage problems; to present urban drainage problems and solutions in a framework of inter-agency cooperation; to achieve urban storm water management; and to contribute to the achievement of the general and specific water quality objectives for the Great Lakes that have been agreed upon by the governments of Ontario and Canada. Photolysis of 3,4-Dichloroaniline in Natural Waters,
W81-01101 5A

Designing Irrigation-Cum-Drainage Ponds for Alkali Lands,
W81-01113 4A

AGRICULTURAL WATERSHEDS

Changes in Nutrient Ion Level of Substrates and Stream Water Due to Land Management in Northumberland,
W81-01046 5C

Algal Availability of Sediment Phosphorus in Drainage Water of the Black Creek Watershed,
W81-01058 5B

ALABAMA

Predicting the Effects of Storm Surges and Abnormal River Flow on Flooding and Water Movement in Mobile Bay, Alabama,
W81-01008 2E

ALASKA

Water-Resources Reconnaissance of the Southeastern Part of St. Paul Island, Pribilof Islands, Alaska,
W81-01033 4A

Reconnaissance Snow Survey of the National Petroleum Reserve in Alaska, April-May 1979,
W81-01187 2C

ALCOHOLS

Effect of Alcohols on the Mechanical and Transport Properties of Asymmetric Cellulose Acetate Membranes,
W81-01148 5D

ALGAE

Influence of Coal Humic Acid on the Growth of Chlorella Vulgaris Algae,
W81-01009 5C

Algal Availability of Sediment Phosphorus in Drainage Water of the Black Creek Watershed,
W81-01058 5B

Seasonal and Species-Dependent Variability in the Biological Impact of Mine Wastes in an Alpine River,
W81-01111 5C

ALKALI SOILS

Designing Irrigation-Cum-Drainage Ponds for Alkali Lands,
W81-01113 4A

AMMONIA

An Automated System for Monitoring the Kinetics of Biological Oxidation of Ammonia,
W81-01135 5B

ANADROMOUS FISH

The Columbia River: Protein, Power, Preservation, and Politics,
W81-01198 6D

ANALYTICAL TECHNIQUES

Differential Pulse Anodic Stripping Voltammetry of Copper(II) at the Glassy Carbon Electrode,
W81-01010 5A

Interlaboratory Quality Control Study No. 24, Analysis of Eight Acid Herbicides in Natural Fresh Water,
W81-01016 5A

Concentration and Determination of Organic Acids in Complex Aqueous Samples,
W81-01067 5A

Analyzing for Trace Chemicals in Water: A Manager's Guide,
W81-01085 5A

Sediment Oxygen Demand Techniques: A Review and Comparison of Laboratory and in Situ Systems,
W81-01149 5A

ANION EXCHANGE

Concentration and Determination of Organic Acids in Complex Aqueous Samples,
W81-01067 5A

ANNELIDS

Relationship of Pollution to Rocky Substratum Polychaetes on the French Mediterranean Coast,
W81-01099 5A

AQUATIC ENVIRONMENTS

Some Problems of Aquatic Environments in Egypt from a General Viewpoint of Nile Ecology,
W81-01072 5C

AQUATIC HABITATS

Fish Management and Protection,
W81-01012 8I

AQUATIC INSECTS

Recolonization of Streams by Aquatic Insects Following Channelization,
W81-01157 5C

AQUATIC LIFE

Seasonal and Species-Dependent Variability in the Biological Impact of Mine Wastes in an Alpine River,
W81-01111 5C

AQUATIC PLANTS

The Aquatic Vegetation of Llangorse Lake, Wales,
W81-01131 5C

AQUEOUS SOLUTIONS

Chloride Ions in Aqueous Solutions,
W81-01049 1B

AQUIFER CHARACTERISTICS

Ground-Water Appraisal of the Fishkill-Beacon Area, Dutchess County, New York,
W81-01028 2F

Geology and Ground Water in North-Central Santa Cruz County, California,
W81-01044 7C

Digital-Simulation and Projection of Head Changes in the Potomac-Raritan-Magothy Aquifer System, Coastal Plain, New Jersey,
W81-01185 2F

Development and Use of a Mathematical Model of the San Bernardino Valley Ground-Water Basin, California,
W81-01186 2F

Simulated Effects of a Proposed Well Field on the Groundwater System in the Salt River Indian Reservation, Maricopa County, Arizona,
W81-01191 2F

Availability and Quality of Groundwater, Southern Ute Indian Reservation, Southwestern Colorado,
W81-01197 5B

AQUIFER SYSTEMS

Ground-Water Appraisal of the Fishkill-Beacon Area, Dutchess County, New York,
W81-01028 2F

AQUIFERS

Simulated Water-Level Declines Near Marienthal, West-Central Kansas,
W81-01030 4B

Geologic Aspects of the Surficial Aquifer in the Upper East Coast Planning Area, Southeast Florida,
W81-01038 4B

What to do When the Well Runs Dry,
W81-01060 3F

ARIZONA

Simulated Effects of a Proposed Well Field on the Groundwater System in the Salt River Indian Reservation, Maricopa County, Arizona,
W81-01191 2F

ARKANSAS

Water-Quality Investigation of the Caney Creek Watershed, Northeast Arkansas,
W81-01189 6A

AROMATIC COMPOUNDS

Concentration and Determination of Polycyclic Aromatic Hydrocarbons in Aqueous Samples on Graphitized Carbon Black,
W81-01068 5A

ARTIFICIAL LAKES

A Salt Balance Simulation Model of Lake Nasser,
W81-01073 2H

ARTIFICIAL RECHARGE

An Economic Evaluation of the Feasibility of Artificial GroundWater Recharge in Nebraska,
W81-01155 6B

ASBESTOS FIBRES

Asbestos Fibres in Receiving Waters,
W81-01013 5A

ASIATIC CLAM

Asiatic Clam Invasion: Causes and Effects,
W81-01173 5C

ASSAY
Differential Pulse Anodic Stripping Voltammetry of Copper(II) at the Glassy Carbon Electrode,
W81-01010 5A

Direct Potentiometric Water Hardness Determination Using Ion-Selective Electrodes,
W81-01051 5A

ATLANTIC OCEAN
Coincidence of Cadmium and Antibiotic Resistance in New York Bight Apex Benthic Microorganisms,
W81-01116 5B

AUDITS
Management Audits for the 80's,
W81-01098 6E

AUTOMATION
Automatic Sewage Samplers: What to Look for When Buying,
W81-01103 5A

BACTERIA
Storage-Induced Denitrification Using Sequencing Batch Reactor Operation,
W81-01132 5D

Enhancement of PCBS Biodegradation by Sodium Ligninsulfonate,
W81-01133 5D

The Thermal Sensitivity of Nitrification as a Function of the Concentration of Nitrogen Substrate,
W81-01145 5D

Translocation of Mercury and Microbial Adaptation in a Model Aquatic System,
W81-01174 5B

BASELINE STUDIES
Sediment Transport in the Snake and Clearwater Rivers in the Vicinity of Lewiston, Idaho,
W81-01037 2J

Water-Quality Investigation of the Caney Creek Watershed, Northeast Arkansas,
W81-01189 6A

BASIC DATA COLLECTIONS
Water-Quality Monitoring of Three Major Tributaries to the Chesapeake Bay--Interim Data Report,
W81-01184 7C

BASINS
The Truckee Basin Fishery, 1844-1944,
W81-01162 5C

BAYS
Sediment Transport of Streams Tributary to San Francisco, San Pablo, and Suisun Bays, California, 1909-66,
W81-01034 2J

BEAR CREEK BASIN (OR)
Water Quality of Bear Creek Basin, Jackson County, Oregon,
W81-01032 5A

BELLA VISTA WATER DISTRICT (CA)
Low-Cost Filter System Meets Drinking Water Standards,
W81-01084 5F

BENTHIC FAUNA
Coincidence of Cadmium and Antibiotic Resistance in New York Bight Apex Benthic Microorganisms,
W81-01116 5B

BICARBONATES
Effects of Bicarbonate on Sodium Hazard of Irrigation Water: Alternative Formulation,
W81-01089 2G

BIOCHEMICAL OXYGEN DEMAND
A Correlation Method for the Estimation of Retention Times at Full-Scale Sewage Treatment Plants,
W81-01150 5D

BIODEGRADATION
Enhancement of PCBS Biodegradation by Sodium Ligninsulfonate,
W81-01133 5D

BIOINDICATORS
Relationship of Pollution to Rocky Substratum Polychaetes on the French Mediterranean Coast,
W81-01099 5A

Taxonomy, Pollution and Sludge Worm,
W81-01117 5A

BIOLOGICAL MEMBRANES
Residence Time Distribution in Submerged Biofilters,
W81-01140 5D

BIOLOGICAL PROPERTIES
A Statistical Analysis of the Quality of Surface Water in Nebraska,
W81-01180 7C

BLACK RIVER BASIN (NY)
Development of a Model for Estimating the Extent of River Flooding with Satellite and In Situ Data,
W81-01203 7B

BLACK RIVER (NC)
Quality of Water in the Black River Near Dunn, North Carolina, and Ground-Water Levels Adjacent to the River Prior to Channel Excavation in 1976-79,
W81-01193 6A

BOREHOLE GEOPHYSICS
Use of Geophysical Logs to Estimate Water-Quality Trends in Carbonate Aquifers,
W81-01029 7B

BORON
Boron Recovery by Reverse Osmosis,
W81-01056 5D

BOULDER COUNTY (CO)
Water Resources of Boulder County, Colorado,
W81-01031 5B

BOX ELDER COUNTY (UT)
Seepage Study of the West Side and West Canals, Box Elder County, Utah,
W81-01026 4A

BRAZIL
Hydrologic Investigations in the Araguaia-Tocantins River Basin (Brazil),
W81-01188 7A

BROMINE
Chlorine Disappearance in Sea Water,
W81-01143 5F

BUFORD DAM (GA)
An Economic Analysis of Selected Strategies for Dissolved-Oxygen Management: Chattahoochee River, Georgia,
W81-01036 5B

CADMIUM
Coincidence of Cadmium and Antibiotic Resistance in New York Bight Apex Benthic Microorganisms,
W81-01116 5B

CALCIUM CHLORIDE
Chloride Ions in Aqueous Solutions,
W81-01049 1B

CALIFORNIA
Sediment Transport of Streams Tributary to San Francisco, San Pablo, and Suisun Bays, California, 1909-66,
W81-01034 2J

Geology and Ground Water in North-Central Santa Cruz County, California,
W81-01044 7C

Development and Use of a Mathematical Model of the San Bernardino Valley Ground-Water Basin, California,
W81-01186 2F

CANADA
Interlaboratory Quality Control Study No. 24, Analysis of Eight Acid Herbicides in Natural Fresh Water,
W81-01016 5A

International Management of the Columbia,
W81-01201 6E

CANAL SEEPAGE
Seepage Study of the West Side and West Canals, Box Elder County, Utah,
W81-01026 4A

CANEY CREEK WATERSHED (AR)
Water-Quality Investigation of the Caney Creek Watershed, Northeast Arkansas,
W81-01189 6A

CAPE COD
Hypolimnetic Metabolism in Three Cape Cod Lakes,
W81-01128 2H

CARBOHYDRATES
The Monosaccharide Spectra of Natural Waters,
W81-01053 2K

CARBON
Storage-Induced Denitrification Using Sequencing Batch Reactor Operation,
W81-01132 5D

CARSON RIVER BASIN (CA-NV)
Planning and Design of Studies for River-Quality Assessment in the Truckee and Carson River Basins, California and Nevada,
W81-01024 6A

CHANNEL IMPROVEMENT
Quality of Water in the Black River Near Dunn, North Carolina, and Ground-Water Levels Adjacent to the River Prior to Channel Excavation in 1976-79,
W81-01193 6A

CHANNELING
Recolonization of Streams by Aquatic Insects Following Channelization,
W81-01157 5C

CHATTAHOOCHEE RIVER (GA)
An Economic Analysis of Selected Strategies for Dissolved-Oxygen Management: Chattahoochee River, Georgia,
W81-01036 5B

CHEMCIAL OXYGEN DEMAND
Sediment Oxygen Demand Techniques: A Review and Comparison of Laboratory and in Situ Systems,
W81-01149 5A

CHEMICAL ANALYSIS
Differential Pulse Anodic Stripping Voltammetry of Copper(II) at the Glassy Carbon Electrode,
W81-01010 5A

Statistical Analyses of Surface-Water-Quality Variables in the Coal Area of Southeastern Montana,
W81-01023 5B

Experimental Assessment of Haloform Reaction Precursors (Etude d'une Methode d'Evaluation Globale des Precurseurs de la Reaction Haloforme),
W81-01151 5D

Chemical and Spectroscopic Characterization of Humic Substances Derived from River Swamps in the Flood Plains of Southeastern U.S. Coastal Streams,
W81-01158 5A

A Statistical Analysis of the Quality of Surface Water in Nebraska,
W81-01180 7C

CHEMICAL DOSAGE CONTROLS
Chemical Dosage Control for Phosphorus Removal.
W81-01018 5D

CHEMICAL REACTIONS
An Automated System for Monitoring the Kinetics of Biological Oxidation of Ammonia,
W81-01135 5B

CHEMICAL TREATMENT
Report of the Urban Drainage Sub-Committee Projects Conducted 1972-1978.
W81-01019 5D

CHEMICALS
Coincidence of Cadmium and Antibiotic Resistance in New York Bight Apex Benthic Microorganisms,
W81-01116 5B

CHESAPEAKE BAY
Water-Quality Monitoring of Three Major Tributaries to the Chesapeake Bay--Interim Data Report,
W81-01184 7C

CHLORELLA
Influence of Coal Humic Acid on the Growth of Chlorella Vulgaris Algae,
W81-01009 5C

CHLORIDES
Chloride Ions in Aqueous Solutions,
W81-01049 1B

CHLORINATION
Experimental Assessment of Haloform Reaction Precursors (Etude d'une Methode d'Evaluation Globale des Precurseurs de la Reaction Haloforme),
W81-01151 5D

CHLORINE
Chlorine Disappearance in Sea Water,
W81-01143 5F

CHLOROPHYTA
Different Methods to Extract Sewage Sludge for the Cultivation of Chlorella Pyrenoidosa,
W81-01069 5D

CHROMATOGRAPHY
Concentration and Determination of Polycyclic Aromatic Hydrocarbons in Aqueous Samples on Graphitized Carbon Black,
W81-01068 5A

Determination of the Aqueous Solubilities of Organic Liquids at 10.0, 20.0, and 30.0 C by Elution Chromatography,
W81-01127 5A

CLAMS
Gas Chromatography Combined with Mass Spectrometry for the Identification of Organic Sulfur Compounds in Shellfish and Fish,
W81-01123 5C

Asiatic Clam Invasion: Causes and Effects,
W81-01173 5C

CLIMATIC DATA
Programs Revap and Wevap for Estimating Areal Evapotranspiration and Lake Evaporation From Climatological Observations,
W81-01017 2D

CLOGGING
Asiatic Clam Invasion: Causes and Effects,
W81-01173 5C

COALS
Influence of Coal Humic Acid on the Growth of Chlorella Vulgaris Algae,
W81-01009 5C

COASTAL PLAIN (NJ)
Digital-Simulation and Projection of Head Changes in the Potomac-Raritan-Magothy Aquifer System, Coastal Plain, New Jersey,
W81-01185 2F

COASTS
Relationship of Pollution to Rocky Substratum Polychaetes on the French Mediterranean Coast,
W81-01099 5A

COKE PLANT EFFLUENTS
Efficiencies of Liquid-Liquid Extraction and XAD-4 and XAD-7 Resins in Collecting Organic Compounds from a Coke Plant's Effluent,
W81-01112 5A

COLOR
Colour and Turbidity Removal with Reusable Magnetic Particles-II. Coagulation with Magnetic Polymer Composites,
W81-01141 5F

COLORADO
Water Resources of Boulder County, Colorado,
W81-01031 5B

Water-Resources Investigations of the U.S. Geological Survey in Colorado--Fiscal Year 1980.
W81-01182 7A

Availability and Quality of Groundwater, Southern Ute Indian Reservation, Southwestern Colorado,
W81-01197 5B

COLUMBIA RIVER
Concern Over the Columbia Estuary,

Five-Year Water Resources Research and Development Plan, Fiscal Years 1982-1986.
W81-01160 6E

Planning for Fiscal Years 1982/1986.
W81-01163 6E

Five-Year Water Resources Research and Development Plan, Fiscal Years 1982-1986,
W81-01164 6E

FLASH FLOODS
Flood of June 18, 1978, on Honey Creek Tributary at Thornville, Ohio,
W81-01194 2E

FLOCCULATION
Colour and Turbidity Removal with Reusable Magnetic Particles-II. Coagulation with Magnetic Polymer Composites,
W81-01141 5F

FLOOD CONTROL
Quality of Water in the Black River Near Dunn, North Carolina, and Ground-Water Levels Adjacent to the River Prior to Channel Excavation in 1976-79,
W81-01193 6A

FLOOD FORECASTING
Development of a Model for Estimating the Extent of River Flooding with Satellite and In Situ Data,
W81-01203 7B

FLOOD PLAINS
Chemical and Spectroscopic Characterization of Humic Substances Derived from River Swamps in the Flood Plains of Southeastern U.S. Coastal Streams,
W81-01158 5A

FLOOD PROFILES
Aerial Infrared Photography for Flood Plain Investigations,
W81-01055 7B

FLOODING
Predicting the Effects of Storm Surges and Abnormal River Flow on Flooding and Water Movement in Mobile Bay, Alabama,
W81-01008 2E

FLOODS
Flood of June 18, 1978, on Honey Creek Tributary at Thornville, Ohio,
W81-01194 2E

FLORIDA
Model Evaluation of the Hydrogeology of the Morris Bridge Well Field and Vicinity in West-Central Florida,
W81-01027 6A

Geologic Aspects of the Surficial Aquifer in the Upper East Coast Planning Area, Southeast Florida,
W81-01038 4B

FLORIDAN AQUIFER
Model Evaluation of the Hydrogeology of the Morris Bridge Well Field and Vicinity in West-Central Florida,
W81-01027 6A

FLOTATION
Advanced Primary Treatment for Ocean Discharge,
W81-01079 5D

FLOW
Mass Balance,
W81-01134 5B

Analysis of Thermal Impact in Tidal Rivers and Estuaries,
W81-01142 5C

Water Movement Through Stands of Lodgepole Pine Forest in Wyoming,
W81-01175 2D

FLOW NETS
Seepage Study of the West Side and West Canals, Box Elder County, Utah,
W81-01026 4A

FLOW RATES
Flow Equalize All Influent,
W81-01119 5D

FLOW RESISTANCE
Comparative Resistance of the Soil and the Plant to Water Transport,
W81-01082 2G

FORECASTING
Predicting the Effects of Storm Surges and Abnormal River Flow on Flooding and Water Movement in Mobile Bay, Alabama,
W81-01008 2E

FOREST MANAGEMENT
Irrigation of Intensively Cultured Plantations with Paper Mill Effluent,
W81-01094 3C

FORESTS
Litterfall, Stemflow, and Throughfall Nutrient Fluxes in an Alluvial Swamp Forest,
W81-01065 5B

Water Movement Through Stands of Lodgepole Pine Forest in Wyoming,
W81-01175 2D

FRANKLIN COUNTY (IN)
A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-load Assimilation Study for Little Laughery Creek, Ripley and Franklin Counties, Indiana,
W81-01025 5B

FREEZING
Design and Specifications of a 500 Gallon Per Day Secondary Refrigerant Freeze Concentration Pilot Plant to Treat Aqueous-Organic Industrial Streams, Phase 1,
W81-01006 5D

Anticipate Pipe Freeze-Ups,
W81-01075 3D

FRESHWATER
Interlaboratory Quality Control Study No. 24, Analysis of Eight Acid Herbicides in Natural Fresh Water,
W81-01016 5A

FULVIC ACIDS
Differential Pulse Anodic Stripping Voltammetry of Copper(II) at the Glassy Carbon Electrode,
W81-01010 5A

Chemical and Spectroscopic Characterization of Humic Substances Derived from River Swamps in the Flood Plains of Southeastern U.S. Coastal Streams,
W81-01158 5A

FUNGI
Utilization of the White-Rot Fungus Sporotrichum Pulverulentum for Water Purification and Protein Production on Mixed Lignocellulosic Wastewaters,
W81-01126 5D

GAS
Digester Methane Utilization Can be Optimized,
W81-01095 5D

GAS CHROMATOGRAPHY
Gas Chromatography Combined with Mass Spectrometry for the Identification of Organic Sulfur Compounds in Shellfish and Fish,
W81-01123 5C

Enhancement of PCBS Biodegradation by Sodium Ligninsulfonate,
W81-01133 5D

GEOCHEMISTRY
Geochemistry of Water in the Fort Union Formation of the Northern Powder River Basin, Southeastern Montana,
W81-01041 5B

GEOLOGY
Geologic Aspects of the Surficial Aquifer in the Upper East Coast Planning Area, Southeast Florida,
W81-01038 4B

GEORGIA
An Economic Analysis of Selected Strategies for Dissolved-Oxygen Management: Chattahoochee River, Georgia,
W81-01036 5B

GLENDALE (CA)
Los Angeles, Glendale Share Reuse Plant's Provisions,
W81-01096 5D

GREAT BRITAIN
The Aquatic Vegetation of Llangorse Lake, Wales,
W81-01131 5C

GREAT LAKES
Chemical Dosage Control for Phosphorus Removal.
W81-01018 5D

Report of the Urban Drainage Sub-Committee Projects Conducted 1972-1978.
W81-01019 5D

Pilot Scale Evaluation of Physical-Chemical Wastewater Treatment System for Combined Sewer Overflows.
W81-01020 8B

Manual of Practice on Urban Drainage.
W81-01021 10D

GROUNDWATER
Simulated Water-Level Declines Near Marienthal, West-Central Kansas,
W81-01030 4B

Water Resources of Boulder County, Colorado,
W81-01031 5B

Geologic Aspects of the Surficial Aquifer in the Upper East Coast Planning Area, Southeast Florida,
W81-01038 4B

Water Resources Data for Montana, Water Year 1979.
W81-01039 7C

Water Resources Data for Puerto Rico, Water Year 1977. Surface and Quality-of-Water Records and Ground Water Records.
W81-01040 7C

Geochemistry of Water in the Fort Union Formation of the Northern Powder River Basin, Southeastern Montana,
W81-01041 5B

Water Resources Data for Pennsylvania, Water Year 1979--Volume 1. Delaware River Basin.
W81-01042 7C

A Variable-Depth Ground-Water Sampler,
W81-01088 5A

Viruses in Groundwater,
W81-01121 5B

A Well-Head Instrument Package for Multi-Parameter Measurement during Well Water Sampling,
W81-01138 5A

Water Resources Data For Washington, Water Year 1979--Volume 1. Western Washington.
W81-01176 7C

Water Resources Data for Washington, Water Year 1979--Volume 2. Eastern Washington.
W81-01177 7C

Water Resources Data for Missouri, Water Year 1979.
W81-01178 7C

Water Resources Data for West Virginia, Water Year 1979.
W81-01179 7C

Water-Resources Investigations of the U.S. Geological Survey in Colorado--Fiscal Year 1980.
W81-01182 7A

Simulated Effects of a Proposed Well Field on the Groundwater System in the Salt River Indian Reservation, Maricopa County, Arizona,
W81-01191 2F

Approximate Altitude of Water Levels in Wells in the Chicot and Evangeline Aquifers in the Houston Area, Texas, Spring 1979 and Spring 1980,
W81-01196 2F

GROUNDWATER ALLOCATION (POLICY)
Water Resources Research Coordination and Planning in the Missouri River Basin.
W81-01003 6B

GROUNDWATER AVAILABILITY
Ground-Water Appraisal of the Fishkill-Beacon Area, Dutchess County, New York,
W81-01028 2F

Geology and Ground Water in North-Central Santa Cruz County, California,
W81-01044 7C

Availability and Quality of Groundwater, Southern Ute Indian Reservation, Southwestern Colorado,
W81-01197 5B

GROUNDWATER BASINS
Development and Use of a Mathematical Model of the San Bernardino Valley Ground-Water Basin, California,
W81-01186 2F

GROUNDWATER POTENTIAL
Geology and Ground Water in North-Central Santa Cruz County, California,
W81-01044 7C

GROUNDWATER RECHARGE
An Economic Evaluation of the Feasibility of Artificial GroundWater Recharge in Nebraska,
W81-01155 6B

GROUNDWATER RESOURCES
Water Resources Research Coordination and Planning in the Missouri River Basin.
W81-01003 6B

Ground-Water Appraisal of the Fishkill-Beacon Area, Dutchess County, New York,
W81-01028 2F

Water-Resources Reconnaissance of the Southeastern Part of St. Paul Island, Pribilof Islands, Alaska,
W81-01033 4A

Ground-Water Levels in New Mexico, 1977,
W81-01181 7C

Digital-Simulation and Projection of Head Changes in the Potomac-Raritan-Magothy Aquifer System, Coastal Plain, New Jersey,
W81-01185 2F

Water-Quality Investigation of the Caney Creek Watershed, Northeast Arkansas,
W81-01189 6A

HARDEMAN COUNTY (TN)
Susceptibility of the Memphis Water Supply to Contamination from the Pesticide Waste Disposal Site in Northeastern Hardeman County, Tennessee,
W81-01192 5B

HARDNESS (WATER)
Direct Potentiometric Water Hardness Determination Using Ion-Selective Electrodes,
W81-01051 5A

Corrosiveness of Drinking Water and Cardiovascular Disease Mortality,
W81-01109 5F

HAWAII
Test Monitoring of Prototype Injection Well, Waiale, Maui, Hawaii,
W81-01190 6A

HEAVY METALS
Effects of Heavy Metals in Combination with NTA, Humic Acid, and Suspended Sediment on Natural Phytoplankton Photosynthesis,
W81-01108 5C

Comment,
W81-01146 5D

HERBICIDES
Photolysis of 3,4-Dichloroaniline in Natural Waters,
W81-01101 5A

HISTORY
The Orr Ditch Case, 1913-1944,
W81-01161 6E

The Truckee Basin Fishery, 1844-1944,
W81-01162 5C

HONEY CREEK TRIBUTARY (OH)
Flood of June 18, 1978, on Honey Creek Tributary at Thornville, Ohio,
W81-01194 2E

HONOLULU
Advanced Primary Treatment for Ocean Discharge,
W81-01079 5D

HOUSTON AREA (TX)
Approximate Altitude of Water Levels in Wells in the Chicot and Evangeline Aquifers in the Houston Area, Texas, Spring 1979 and Spring 1980,
W81-01196 2F

HUMAN DISEASES
Corrosiveness of Drinking Water and Cardiovascular Disease Mortality,
W81-01109 5F

HUMIC ACIDS
Influence of Coal Humic Acid on the Growth of Chlorella Vulgaris Algae,
W81-01009 5C

Chemical and Spectroscopic Characterization of Humic Substances Derived from River Swamps

in the Flood Plains of Southeastern U.S. Coastal Streams,
W81-01158 5A

HYDRAULIC CONDUCTIVITY
A Closed-Form Equation for Predicting the Hydraulic Conductivity of Unsaturated Soils,
W81-01087 2G

Comparison of One-Step Outflow Laboratory Method to an in Situ Method for Measuring Hydraulic Conductivity,
W81-01092 2G

HYDRAULIC STRUCTURES
Offshore Water Intakes Designed to Protect Fish,
W81-01070 6G

HYDROELECTRIC PLANTS
Water Quality of the Columbia River,
W81-01200 5C

HYDROELECTRIC POWER
The Columbia River: Protein, Power, Preservation, and Politics,
W81-01198 6D

Agriculture and Hydro-Power: Costs, Benefits, and Trade-Offs,
W81-01199 6B

HYDROELECTRIC POWER PLANTS
The Columbia River: Protein, Power, Preservation, and Politics,
W81-01198 6D

HYDROGEOLOGY
Model Evaluation of the Hydrogeology of the Morris Bridge Well Field and Vicinity in West-Central Florida,
W81-01027 6A

Digital-Simulation and Projection of Head Changes in the Potomac-Raritan-Magothy Aquifer System, Coastal Plain, New Jersey,
W81-01185 2F

HYDROLOGIC DATA
Seepage Study of the West Side and West Canals, Box Elder County, Utah,
W81-01026 4A

Water Resources Data for Montana, Water Year 1979.
W81-01039 7C

Water Resources Data for Puerto Rico, Water Year 1977. Surface and Quality-of-Water Records and Ground Water Records.
W81-01040 7C

Water Resources Data for Pennsylvania, Water Year 1979--Volume 1. Delaware River Basin.
W81-01042 7C

Lakes of Oregon: Volume 6. Douglas County,
W81-01043 2H

Water Resources Data For Washington, Water Year 1979--Volume 1. Western Washington.
W81-01176 7C

Water Resources Data for Washington, Water Year 1979--Volume 2. Eastern Washington.
W81-01177 7C

Water Resources Data for Missouri, Water Year 1979.
W81-01178 7C

Water Resources Data for West Virginia, Water Year 1979.
W81-01179 7C

HYDROLOGIC EQUATION
Mass Balance,
W81-01134 5B

HYPERION PLANT
Los Angeles to Meet Regs with Energy-Miser Sludge Processor,
W81-01152 5D

HYPOLIMNION
Hypolimnetic Metabolism in Three Cape Cod Lakes,
W81-01128 2H

IDAHO
Sediment Transport in the Snake and Clearwater Rivers in the Vicinity of Lewiston, Idaho,
W81-01037 2J

IMAGE ANALYSIS
Development of a Model for Estimating the Extent of River Flooding with Satellite and In Situ Data,
W81-01203 7B

IMPAIRED WATER USE
Using Saline Water for Crop Production in New Mexico,
W81-01156 3C

INDIANA
A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-load Assimilation Study for Little Laughery Creek, Ripley and Franklin Counties, Indiana,
W81-01025 5B

Water-Quality Assessment of the Porter County Watershed, Kankakee River Basin, Porter County, Indiana,
W81-01035 5B

INDUSTRIAL WASTES
Plating Waste Treatment,
W81-01057 5D

Screening at a Fellmongery.
W81-01107 5D

Utilization of the White-Rot Fungus Sporotrichum Pulverulentum for Water Purification and Protein Production on Mixed Lignocellulosic Wastewaters,
W81-01126 5D

Ultrafiltration Processes for Pollution Control and Chemical Reuse in the Tanning Industry,
W81-01139 5D

Wastewater Characterization in a Multiproduct Dairy,
W81-01170 5F

Treatment of Dilute Metal Effluents in an Electrolytic Precipitator,
W81-01172 5D

INDUSTRIAL WATER
Wastewater Characterization in a Multiproduct Dairy,
W81-01170 5F

INFLOW
Flow Equalize All Influent,
W81-01119 5D

INFORMATION RETRIEVAL
Fiscal 1980 Annual Report to Office of Water Research and Technology, USDI.
W81-01004 6E

Program Layout - An Interactive Program to Handle Page Layout for Documentation of Computer Files Printed on-Line at Remote Terminals,
W81-01015 7B

INFRARED RADIATION
Aerial Infrared Photography for Flood Plain Investigations,
W81-01055 7B

INJECTION WELLS
Saturated-Unsaturated Flow in Radial Directions Generated by an Injection Well,
W81-01091 2G

Test Monitoring of Prototype Injection Well, Waiale, Maui, Hawaii,
W81-01190 6A

INTAKES
Asiatic Clam Invasion: Causes and Effects,
W81-01173 5C

INTERNATIONAL WATERS

W81-01043 2H

ORGANIC ACIDS
Design and Specifications of a 500 Gallon Per Day Secondary Refrigerant Freeze Concentration Pilot Plant to Treat Aqueous-Organic Industrial Streams, Phase 1,
W81-01006 5D

ORGANIC COMPOUNDS
Efficiencies of Liquid-Liquid Extraction and XAD-4 and XAD-7 Resins in Collecting Organic Compounds from a Coke Plant's Effluent,
W81-01112 5A

Determination of the Aqueous Solubilities of Organic Liquids at 10.0, 20.0, and 30.0 C by Elution Chromatography,
W81-01127 5A

Storage-Induced Denitrification Using Sequencing Batch Reactor Operation,
W81-01132 5D

ORGANIC LOADING
A Reaction Chamber for Study of Interactions between Sediments and Water under Conditions of Static or Continuous Flow,
W81-01137 5B

ORGANIC MATTER
Evaluation of Steady-State-Biofilm Kinetics,
W81-01125 5A

OUTFALL SEWERS
Mussels (Mytilus Edulis) as 'Point Source' Indicators of Trace Metal Pollution,
W81-01115 5A

OXIDATION
Hypolimnetic Metabolism in Three Cape Cod Lakes,
W81-01128 2H

An Automated System for Monitoring the Kinetics of Biological Oxidation of Ammonia,
W81-01135 5B

The Thermal Sensitivity of Nitrification as a Function of the Concentration of Nitrogen Substrate,
W81-01145 5D

OXYGEN DEMAND
In-Situ Registration of Oxygen Utilization at Sediment-Water Interfaces,
W81-01054 2K

OXYGEN REQUIREMENTS
Improved Wastewater Treatment for Holiday Resort Towns on the Coast,
W81-01081 5D

PASSIOURA METHOD
Comparison of One-Step Outflow Laboratory Method to an in Situ Method for Measuring Hydraulic Conductivity,
W81-01092 2G

PATH OF POLLUTANTS
St. Lawrence River Water Quality Surveys, 1977,
W81-01014 5B

PENNSYLVANIA
Fiscal 1980 Annual Report to Office of Water Research and Technology, USDI
W81-01004 6E

Water Resources Data for Pennsylvania, Water Year 1979--Volume 1. Delaware River Basin.
W81-01042 7C

PESTICIDE RESIDUES
Interlaboratory Quality Control Study No. 24, Analysis of Eight Acid Herbicides in Natural Fresh Water,
W81-01016 5A

PESTICIDES
Susceptibility of the Memphis Water Supply to Contamination from the Pesticide Waste Disposal Site in Northeastern Hardeman County, Tennessee,
W81-01192 5B

PHOSPHATES
Behaviour of Phosphate in Estuarine Water,
W81-01050 5B

PHOSPHORUS
Algal Availability of Sediment Phosphorus in Drainage Water of the Black Creek Watershed,
W81-01058 5B

PHOSPHORUS REMOVAL
Chemical Dosage Control for Phosphorus Removal.
W81-01018 5D

Report of the Urban Drainage Sub-Committee Projects Conducted 1972-1978.
W81-01019 5D

PHOTOLYSIS
Photolysis of 3,4-Dichloroaniline in Natural Waters,
W81-01101 5A

PHOTOSYNTHESIS
Hypolimnetic Metabolism in Three Cape Cod Lakes,
W81-01128 2H

PILOT PLANTS
Design and Specifications of a 500 Gallon Per Day Secondary Refrigerant Freeze Concentration Pilot Plant to Treat Aqueous-Organic Industrial Streams, Phase 1,
W81-01006 5D

PLANNING
Effective Wastewater Management Planning for Small Communities - Part 2,
W81-01083 6E

Management Audits for the 80's,
W81-01098 6E

Water Problems and Research Needs for Wisconsin, A 5-Year Plan,
W81-01159 6E

Five-Year Water Resources Research and Development Plan, Fiscal Years 1982-1986.
W81-01160 6E

Planning for Fiscal Years 1982/1986.
W81-01163 6E

Five-Year Water Resources Research and Development Plan, Fiscal Years 1982-1986,
W81-01164 6E

PLANT PHYSIOLOGY
Comparative Resistance of the Soil and the Plant to Water Transport,
W81-01082 2G

POLAROGRAPHIC ANALYSIS
Determinations of Trace Amounts of 9,10-Anthraquinone in Aqueous Systems by Differential Pulse Polarography,
W81-01106 5A

POLLUTANT IDENTIFICATION
Concentration and Determination of Organic Acids in Complex Aqueous Samples,
W81-01067 5A

Determinations of Trace Amounts of 9,10-Anthraquinone in Aqueous Systems by Differential Pulse Polarography,
W81-01106 5A

POLYCHLORINATED BIPHENYLS
Enhancement of PCBS Biodegradation by Sodium Ligninsulfonate,
W81-01133 5D

POLYMERS
Development of Novel Porous Substrates for Ultrafiltration, Desalination, and Water Reclamation,
W81-01001 3A

POPULATIONS
Long Term Effect of Sewage Sludge Additions on Populations of Nocardia Asteroides, Micromonospora and Thermoactinomyces in Soil,
W81-01061 5C

POST-IMPOUNDMENT
Sediment Transport in the Snake and Clearwater Rivers in the Vicinity of Lewiston, Idaho,
W81-01037 2J

POTABLE WATER
Low-Cost Filter System Meets Drinking Water Standards,
W81-01084 5F

Corrosiveness of Drinking Water and Cardiovascular Disease Mortality,
W81-01109 5F

Philosophy of the Safe Drinking Water Act and Potable Reuse,
W81-01120 5D

POTENTIOMETRIC LEVEL
Model Evaluation of the Hydrogeology of the Morris Bridge Well Field and Vicinity in West-Central Florida,
W81-01027 6A

Approximate Altitude of Water Levels in Wells in the Chicot and Evangeline Aquifers in the Houston Area, Texas, Spring 1979 and Spring 1980,
W81-01196 2F

POTOMAC-RARITAN-MAGOTHY AQUIFER SYSTEM
Digital-Simulation and Projection of Head Changes in the Potomac-Raritan-Magothy Aquifer System, Coastal Plain, New Jersey,
W81-01185 2F

POWER PLANTS
Asiatic Clam Invasion: Causes and Effects,
W81-01173 5C

PRE-IMPOUNDMENT
Sediment Transport in the Snake and Clearwater Rivers in the Vicinity of Lewiston, Idaho,
W81-01037 2J

PREDATION
Predator-Prey Relations Important for the Biotic Changes in Acidified Lakes,
W81-01129 5C

PRICING
Wholesale Water Pricing: A Cost-To-Serve Plan that Works,
W81-01104 6C

PROGRAMS
U.S. Geological Survey Activities in New York, 1979.

Comparative Resistance of the Soil and the Plant to Water Transport,
W81-01082 2G

SOILS
Interactions and Survival of Enteric Viruses in Soil Materials,
W81-01171 5B

SOLAR RADIATION
Photolysis of 3,4-Dichloroaniline in Natural Waters,
W81-01101 5A

SOLIDS CONTACT
Solids-Contact Clarification Brings Out Best of Trickling Filters,
W81-01097 5D

SOLIDS CONTACT PROCESSES
The Effect of Concentration of Adsorbing Solids on the Partition Coefficient.
W81-01144 5B

SOLUBILITY
Determination of the Aqueous Solubilities of Organic Liquids at 10.0, 20.0, and 30.0 C by Elution Chromatography,
W81-01127 5A

SORPTION
Third-Order Integral Relation Between Sorptivity and Soil Water Diffusivity Using Brutsaert's Technique,
W81-01076 2G

SOUTHEAST FLORIDA
Geologic Aspects of the Surficial Aquifer in the Upper East Coast Planning Area, Southeast Florida,
W81-01038 4B

SOUTHEASTERN MONTANA
Statistical Analyses of Surface-Water-Quality Variables in the Coal Area of Southeastern Montana,
W81-01023 5B

SOUTHERN UTE INDIAN RESERVATION (CO)
Availability and Quality of Groundwater, Southern Ute Indian Reservation, Southwestern Colorado,
W81-01197 5B

SPECIFICATIONS
Made to Measure,
W81-01074 8A

SPECTROPHOTOMETRY
The Effect of Surfactants, Cations, and Complexing Agents on the Spectrophotometric Determination of Microgram Amounts of Uranium in Waters,
W81-01052 5A

Experimental Assessment of Haloform Reaction Precursors (Etude d'une Methode d'Evaluation Globale des Precurseurs de la Reaction Haloforme),
W81-01151 5D

SPECTROSCOPY
Chemical and Spectroscopic Characterization of Humic Substances Derived from River Swamps in the Flood Plains of Southeastern U.S. Coastal Streams,
W81-01158 5A

ST. LAWRENCE RIVER
St. Lawrence River Water Quality Surveys, 1977,
W81-01014 5B

ST PAUL ISLAND (AK)
Water-Resources Reconnaissance of the Southeastern Part of St. Paul Island, Pribilof Islands, Alaska,
W81-01033 4A

STORM DRAINS
Efficient Design of Stormwater Holding Basins Used for Water Quality Protection,
W81-01136 5G

STORM RUNOFF
Input into and Fate of Lead in a Small Reservoir,
W81-01045 5B

Modeling the Runoff Process in Urban Areas,
W81-01153 2A

STORM SURGE
Predicting the Effects of Storm Surges and Abnormal River Flow on Flooding and Water Movement in Mobile Bay, Alabama,
W81-01008 2E

STORMWATER MANAGEMENT
Report of the Urban Drainage Sub-Committee Projects Conducted 1972-1978.
W81-01019 5D

STREAMFLOW
Water Quality of Bear Creek Basin, Jackson County, Oregon,
W81-01032 5A

Sediment Transport of Streams Tributary to San Francisco, San Pablo, and Suisun Bays, California, 1909-66,
W81-01034 2J

Recolonization of Streams by Aquatic Insects Following Channelization,
W81-01157 5C

STREAMS
Statistical Analyses of Surface-Water-Quality Variables in the Coal Area of Southeastern Montana,
W81-01023 5B

An Economic Analysis of Selected Strategies for Dissolved-Oxygen Management: Chattahoochee River, Georgia,
W81-01036 5B

Quality of Water in the Black River Near Dunn, North Carolina, and Ground-Water Levels Adjacent to the River Prior to Channel Excavation in 1976-79,
W81-01193 6A

Flood of June 18, 1978, on Honey Creek Tributary at Thornville, Ohio,
W81-01194 2E

STRESS ANALYSIS
The Role of Cortisol in Stress-Induced Metabolic Changes in Fundulus Heteroclitus,
W81-01007 5C

STRUCTURAL SHAPES
Made to Measure,
W81-01074 8A

SUPPLEMENTAL IRRIGATION
Using Saline Water for Crop Production in New Mexico,
W81-01156 3C

SURFACE WATERS
Water Resources of Boulder County, Colorado,
W81-01031 5B

Water Quality of Bear Creek Basin, Jackson County, Oregon,
W81-01032 5A

Water-Resources Reconnaissance of the Southeastern Part of St. Paul Island, Pribilof Islands, Alaska,
W81-01033 4A

Water-Quality Assessment of the Porter County Watershed, Kankakee River Basin, Porter County, Indiana,
W81-01035 5B

Water Resources Data for Montana, Water Year 1979.
W81-01039 7C

Water Resources Data for Puerto Rico, Water Year 1977. Surface and Quality-of-Water Records and Ground Water Records.
W81-01040 7C

Water Resources Data for Pennsylvania, Water Year 1979--Volume 1. Delaware River Basin.
W81-01042 7C

Water Resources Data For Washington, Water Year 1979--Volume 1. Western Washington.
W81-01176 7C

Water Resources Data for Washington, Water Year 1979--Volume 2. Eastern Washington.
W81-01177 7C

Water Resources Data for Missouri, Water Year 1979.
W81-01178 7C

Water Resources Data for West Virginia, Water Year 1979.
W81-01179 7C

A Statistical Analysis of the Quality of Surface Water in Nebraska,
W81-01180 7C

Water-Resources Investigations of the U.S. Geological Survey in Colorado--Fiscal Year 1980.
W81-01182 7A

Water-Quality Investigation of the Caney Creek Watershed, Northeast Arkansas,
W81-01189 6A

SURVEYS
St. Lawrence River Water Quality Surveys, 1977,
W81-01014 5B

Water-Resources Reconnaissance of the Southeastern Part of St. Paul Island, Pribilof Islands, Alaska,
W81-01033 4A

SUSPENDED SOLIDS
A Correlation Method for the Estimation of Retention Times at Full-Scale Sewage Treatment Plants,
W81-01150 5D

SWAMPS
Litterfall, Stemflow, and Throughfall Nutrient Fluxes in an Alluvial Swamp Forest,
W81-01065 5B

Chemical and Spectroscopic Characterization of Humic Substances Derived from River Swamps in the Flood Plains of Southeastern U.S. Coastal Streams,
W81-01158 5A

TELEOSTS
The Role of Cortisol in Stress-Induced Metabolic Changes in Fundulus Heteroclitus,
W81-01007 5C

TEMPERATURE
Remotely Sensed Crop Temperature for Water Resources Management,
W81-01002 7B

Psychrophiles, Psychrotrophs, and Mesophiles in an Environment which Experiences Seasonal Temperature Fluctuations,
W81-01124 5A

Analysis of Thermal Impact in Tidal Rivers and Estuaries,
W81-01142 5C

TEMPERATURE CONTROL
Anticipate Pipe Freeze-Ups,
W81-01075 3D

TENNESSEE
Susceptibility of the Memphis Water Supply to Contamination from the Pesticide Waste Disposal Site in Northeastern Hardeman County, Tennessee,
W81-01192 5B

TERRACING
Costs and Benefits of Terraces for Erosion Control,
W81-01062 4D

TESTING
Test Monitoring of Prototype Injection Well, Waiale, Maui, Hawaii,
W81-01190 6A

TESTING PROCEDURES
Development of Novel Porous Substrates for Ultrafiltration, Desalination, and Water Reclamation,
W81-01001 3A

THAMES RIVER
Rehabilitation of the Inner Thames Estuary,
W81-01118 5C

THERMAL PROPERTIES
The Thermal Sensitivity of Nitrification as a Function of the Concentration of Nitrogen Substrate,
W81-01145 5D

TIDAL STREAMS
Analysis of Thermal Impact in Tidal Rivers and Estuaries,
W81-01142 5C

TOXICITY
Asbestos Fibres in Receiving Waters,
W81-01013 5A

TRACE ELEMENTS
Trace Elements in Water and Biological Samples Determined by X-Ray Spectroscopy,
W81-01077 5A

Analyzing for Trace Chemicals in Water: A Manager's Guide,
W81-01085 5A

Mussels (Mytilus Edulis) as 'Point Source' Indicators of Trace Metal Pollution,
W81-01115 5A

Kinetics of Trace Metal Partitioning in Model Anoxic Marine Sediments,
W81-01154 5B

TRANSPIRATION
Water Movement Through Stands of Lodgepole Pine Forest in Wyoming,
W81-01175 2D

TRANSPORTATION
Navigation as an Alternative Use,
W81-01202 6B

TREATIES
International Management of the Columbia,
W81-01201 6E

TREATMENT FACILITIES
Flow Equalize All Influent,
W81-01119 5D

TRICKLING FILTERS
Solids-Contact Clarification Brings Out Best of Trickling Filters,
W81-01097 5D

TRUCKEE RIVER BASIN (CA-NV)
Planning and Design of Studies for River-Quality Assessment in the Truckee and Carson River Basins, California and Nevada,
W81-01024 6A

TRUCKEE RIVER BASIN (NV)
The Truckee Basin Fishery, 1844-1944,
W81-01162 5C

TURBIDITY
Colour and Turbidity Removal with Reusable Magnetic Particles-II. Coagulation with Magnetic Polymer Composites,
W81-01141 5F

TURBINES
Desalination/Power Cycles with the Biphase Rotary Separator and Turbine,
W81-01165 3A

TURBULENCE
The Aquatic Vegetation of Llangorse Lake, Wales,
W81-01131 5C

Analysis of Thermal Impact in Tidal Rivers and Estuaries,
W81-01142 5C

U.S. GEOLOGICAL SURVEY
U.S. Geological Survey Activities in New York, 1979.
W81-01183 7A

ULTIMATE DISPOSAL
Los Angeles to Meet Regs with Energy-Miser Sludge Processor,
W81-01152 5D

UNCONSOLIDATED AQUIFERS
Maps Showing Saturated Thickness, January 1979, and Percentage Decrease in Saturated Thickness, 1950-79, of Unconsolidated Aquifer, West-Central, Kansas,
W81-01195 7C

URANIUM RADIOISOTOPES
The Effect of Surfactants, Cations, and Complexing Agents on the Spectrophotometric Determination of Microgram Amounts of Uranium in Waters,
W81-01052 5A

URBAN DRAINAGE
Report of the Urban Drainage Sub-Committee Projects Conducted 1972-1978.
W81-01019 5D

Manual of Practice on Urban Drainage.
W81-01021 10D

Modeling the Runoff Process in Urban Areas,
W81-01153 2A

URBAN HYDROLOGY
Modeling the Runoff Process in Urban Areas,
W81-01153 2A

URBAN RUNOFF
Efficient Design of Stormwater Holding Basins Used for Water Quality Protection,
W81-01136 5G

Modeling the Runoff Process in Urban Areas,
W81-01153 2A

UTAH
Seepage Study of the West Side and West Canals, Box Elder County, Utah,
W81-01026 4A

VIRGIN ISLANDS
Water Usage Patterns in the U.S. Virgin Islands,
W81-01005 6D

VIRUSES
Viruses in Groundwater,
W81-01121 5B

Interactions and Survival of Enteric Viruses in Soil Materials,
W81-01171 5B

WASHINGTON
Concern Over the Columbia Estuary,
W81-01011 6E

Water Resources Data For Washington, Water Year 1979--Volume 1. Western Washington.
W81-01176 7C

Water Resources Data for Washington, Water Year 1979--Volume 2. Eastern Washington.
W81-01177 7C

WASTE ASSIMULATIVE CAPACITY
A One-Dimensional, Steady-State, Dissolved-Oxygen Model and Waste-load Assimilation Study for Little Laughery Creek, Ripley and Franklin Counties, Indiana,
W81-01025 5B

WASTE DISPOSAL
Metal Uptake by Crops Grown Over Entrenched Sewage Sludge,
W81-01100 5E

WASTE DUMPS
Susceptibility of the Memphis Water Supply to Contamination from the Pesticide Waste Disposal Site in Northeastern Hardeman County, Tennessee,
W81-01192 5B

WASTE STORAGE
Hydraulic Efficiency of Wastewater Lagoon Systems,
W81-01093 5D

WASTE TREATMENT
Chemical Dosage Control for Phosphorus Removal.
W81-01018 5D

WASTE WATER DISPOSAL
Sand Cambisol Functioning as a Filter through Long-Term Irrigation with Wastewater,
W81-01130 5D

WASTE WATER POLLUTION
Efficiencies of Liquid-Liquid Extraction and XAD-4 and XAD-7 Resins in Collecting Organic Compounds from a Coke Plant's Effluent,
W81-01112 5A

WASTE WATER TREATMENT
Design and Specifications of a 500 Gallon Per Day Secondary Refrigerant Freeze Concentration Pilot Plant to Treat Aqueous-Organic Industrial Streams, Phase 1,
W81-01006 5D

Plating Waste Treatment,
W81-01057 5D

Conception of Plans for a Marseille Purifying Facility. (Conception du Projet de la Station d'Epuration de Marseille),
W81-01078 5D

New Concepts for the Treatment of Sewage Discharged to the Sea,
W81-01080 5D

Improved Wastewater Treatment for Holiday Resort Towns on the Coast,
W81-01081 5D

Effective Wastewater Management Planning for Small Communities - Part 2,
W81-01083 6E

Wastewater Treatment Process Evaluated by Force Account,
W81-01086 6B

Hydraulic Efficiency of Wastewater Lagoon Systems,
W81-01093 5D

Solids-Contact Clarification Brings Out Best of Trickling Filters,
W81-01097 5D

Activated Sludge Wastewater Treatment--Stoichiometric Relationships,
W81-01105 5D

Flow Equalize All Influent,
W81-01119 5D

Utilization of the White-Rot Fungus Sporotrichum Pulverulentum for Water Purification and Protein Production on Mixed Lignocellulosic Wastewaters,
W81-01126 5D

Ultrafiltration Processes for Pollution Control and Chemical Reuse in the Tanning Industry,
W81-01139 5D

Effect of Alcohols on the Mechanical and Transport Properties of Asymmetric Cellulose Acetate Membranes,
W81-01148 5D

Packed Bed Filtration: Experimental Investigation and Conceptual Analysis of Filter Ripening Model,
W81-01168 5D

Interactions and Survival of Enteric Viruses in Soil Materials,
W81-01171 5B

Treatment of Dilute Metal Effluents in an Electrolytic Precipitator,
W81-01172 5D

WASTEWATER TREATMENT
Report of the Urban Drainage Sub-Committee Projects Conducted 1972-1978.
W81-01019 5D

Storage-Induced Denitrification Using Sequencing Batch Reactor Operation,
W81-01132 5D

WASTEWATER TREATMENT *SEWER OUTFALLS
Pilot Scale Evaluation of Physical-Chemical Wastewater Treatment System for Combined Sewer Overflows.
W81-01020 8B

WATER ANALYSIS
Changes in Nutrient Ion Level of Substrates and Stream Water Due to Land Management in Northumberland,
W81-01046 5C

The Effect of Surfactants, Cations, and Complexing Agents on the Spectrophotometric Determination of Microgram Amounts of Uranium in Waters,
W81-01052 5A

Trace Elements in Water and Biological Samples Determined by X-Ray Spectroscopy,
W81-01077 5A

Analyzing for Trace Chemicals in Water: A Manager's Guide,
W81-01085 5A

A Variable-Depth Ground-Water Sampler,
W81-01088 5A

Efficiencies of Liquid-Liquid Extraction and XAD-4 and XAD-7 Resins in Collecting Organic Compounds from a Coke Plant's Effluent,
W81-01112 5A

A Well-Head Instrument Package for Multi-Parameter Measurement during Well Water Sampling,
W81-01138 5A

Sediment Oxygen Demand Techniques: A Review and Comparison of Laboratory and in Situ Systems,
W81-01149 5A

Water-Quality Monitoring of Three Major Tributaries to the Chesapeake Bay--Interim Data Report,
W81-01184 7C

WATER BALANCE
Comparative Resistance of the Soil and the Plant to Water Transport,
W81-01082 2G

WATER CHEMISTRY
Chlorine Disappearance in Sea Water,
W81-01143 5F

Availability and Quality of Groundwater, Southern Ute Indian Reservation, Southwestern Colorado,
W81-01197 5B

WATER CONSERVATION
The Use of the Compartmented Reservoir in Water Harvesting Agrisystems,
W81-01022 3B

WATER COOLING
Offshore Water Intakes Designed to Protect Fish,
W81-01070 6G

WATER DISTRIBUTION (APPLIED)
Water Usage Patterns in the U.S. Virgin Islands,
W81-01005 6D

WATER HARVESTING
The Use of the Compartmented Reservoir in Water Harvesting Agrisystems,
W81-01022 3B

WATER LEVEL FLUCTUATIONS
Ground-Water Levels in New Mexico, 1977,
W81-01181 7C

WATER LEVELS
Quality of Water in the Black River Near Dunn, North Carolina, and Ground-Water Levels Adjacent to the River Prior to Channel Excavation in 1976-79,
W81-01193 6A

Approximate Altitude of Water Levels in Wells in the Chicot and Evangeline Aquifers in the Houston Area, Texas, Spring 1979 and Spring 1980,
W81-01196 2F

WATER MANAGEMENT (APPLIED)
Water Usage Patterns in the U.S. Virgin Islands,
W81-01005 6D

Geologic Aspects of the Surficial Aquifer in the Upper East Coast Planning Area, Southeast Florida,
W81-01038 4B

Effective Wastewater Management Planning for Small Communities - Part 2,

ZOOPLANKTON
Changes in the Zooplankton of Onondaga Lake (NY), 1969-1978,
W81-01122 5C

AUTHOR INDEX

ABDEL-SAMIE, M. E.
A Salt Balance Simulation Model of Lake Nasser,
W81-01073 2H

ABRAHAMSEN, H.
Effects of Heavy Metals in Combination with NTA, Humic Acid, and Suspended Sediment on Natural Phytoplankton Photosynthesis,
W81-01108 5C

AGEMIAN, H.
Interlaboratory Quality Control Study No. 24, Analysis of Eight Acid Herbicides in Natural Fresh Water,
W81-01016 5A

ALAILY, F.
Sand Cambisol Functioning as a Filter through Long-Term Irrigation with Wastewater,
W81-01130 5D

ALBERTSON, O. E.
Advanced Primary Treatment for Ocean Discharge,
W81-01079 5D

ALFANI, F.
Effect of Alcohols on the Mechanical and Transport Properties of Asymmetric Cellulose Acetate Membranes,
W81-01148 5D

ALLEMAN, J. E.
Storage-Induced Denitrification Using Sequencing Batch Reactor Operation,
W81-01132 5D

AMMANN, D.
Direct Potentiometric Water Hardness Determination Using Ion-Selective Electrodes,
W81-01051 5A

ANDERSON, N. J.
Colour and Turbidity Removal with Reusable Magnetic Particles-II. Coagulation with Magnetic Polymer Composites,
W81-01141 5F

ANDREWS, M. J.
Rehabilitation of the Inner Thames Estuary,
W81-01118 5C

APRIL, G. C.
Predicting the Effects of Storm Surges and Abnormal River Flow on Flooding and Water Movement in Mobile Bay, Alabama,
W81-01008 2E

BABU, D. K.
Saturated-Unsaturated Flow in Radial Directions Generated by an Injection Well,
W81-01091 2G

BACCHUS, Z.
The Aquatic Vegetation of Llangorse Lake, Wales,
W81-01131 5C

BADER, E. F.
Management Audits for the 80's,
W81-01098 6E

BANSAL, I. K.
Boron Recovery by Reverse Osmosis,
W81-01056 5D

BARBARICK, K. A.
Application of Sewage Effluent to Columns of a Mountain Meadow Soil: I. Errors in Calculating the Transport of Ionic Salts,
W81-01090 3C

BARROR, R. F.
Effective Wastewater Management Planning for Small Communities - Part 2,
W81-01083 6E

BAUMANN, P. G.
Digester Methane Utilization Can be Optimized,
W81-01095 5D

BEK, B.
Trace Elements in Water and Biological Samples Determined by X-Ray Spectroscopy,
W81-01077 5A

BELLAN, G.
Relationship of Pollution to Rocky Substratum Polychaetes on the French Mediterranean Coast,
W81-01099 5A

BELMONT, T. V.
Plating Waste Treatment,
W81-01057 5D

BENOIT, G. R.
Low-Cost Filter System Meets Drinking Water Standards,
W81-01084 5F

BERG, O.
Land Use. Pigs in Pokes: Pork Barrel Water Projects,
W81-01063 5C

BLAD, B. L.
Remotely Sensed Crop Temperature for Water Resources Management,
W81-01002 7B

BLIZZARD, W. E.
Comparative Resistance of the Soil and the Plant to Water Transport,
W81-01082 2G

BLOCK, B.
Anticipate Pipe Freeze-Ups,
W81-01075 3D

BLUME, H-P.
Sand Cambisol Functioning as a Filter through Long-Term Irrigation with Wastewater,
W81-01130 5D

BLYTH, K.
Aerial Infrared Photography for Flood Plain Investigations,
W81-01055 7B

BOBO, L. L.
Water-Quality Assessment of the Porter County Watershed, Kankakee River Basin, Porter County, Indiana,
W81-01035 5B

BOLTO, B. A.
Colour and Turbidity Removal with Reusable Magnetic Particles-II. Coagulation with Magnetic Polymer Composites,
W81-01141 5F

BORS, G. W.
Hydraulic Efficiency of Wastewater Lagoon Systems,
W81-01093 5D

BOWMAN, G. T.
Sediment Oxygen Demand Techniques: A Review and Comparison of Laboratory and in Situ Systems,
W81-01149 5A

BOYD, E. L.
Water Resources of Boulder County, Colorado,
W81-01031 5B

BOYER, J. S.
Comparative Resistance of the Soil and the Plant to Water Transport,
W81-01082 2G

BRACH, J. C.
Costs and Benefits of Terraces for Erosion Control,
W81-01062 4D

BRADDOCK, R. D.
Third-Order Integral Relation Between Sorptivity and Soil Water Diffusivity Using Brutsaert's Technique,
W81-01076 2G

BRADSHAW, H. D.
Litterfall, Stemflow, and Throughfall Nutrient Fluxes in an Alluvial Swamp Forest,
W81-01065 5B

BRANNON, J. M.
A Reaction Chamber for Study of Interactions between Sediments and Water under Conditions of Static or Continuous Flow,
W81-01137 5B

BREW, J. S.
Mass Balance,
W81-01134 5B

BRINKHURST, R. O.
Taxonomy, Pollution and Sludge Worm,
W81-01117 5A

BRINSON, M. M.
Litterfall, Stemflow, and Throughfall Nutrient Fluxes in an Alluvial Swamp Forest,
W81-01065 5B

BROGDEN, R. E.
Availability and Quality of Groundwater, Southern Ute Indian Reservation, Southwestern Colorado,
W81-01197 5B

BRONSTAD, J. O.
Determinations of Trace Amounts of 9,10-Anthraquinone in Aqueous Systems by Differential Pulse Polarography,
W81-01106 5A

BROWN, W. M. III
Planning and Design of Studies for River-Quality Assessment in the Truckee and Carson River Basins, California and Nevada,
W81-01024 6A

BRYSON, A. W.
Treatment of Dilute Metal Effluents in an Electrolytic Precipitator,
W81-01172 5D

BULLOCK, D. C.
Water Usage Patterns in the U.S. Virgin Islands,
W81-01005 6D

BURTON, G. A.
A Reaction Chamber for Study of Interactions between Sediments and Water under Conditions of Static or Continuous Flow,
W81-01137 5B

CABASSO, I.
Development of Novel Porous Substrates for Ultrafiltration, Desalination, and Water Reclamation,
W81-01001 3A

CAIN, D.
Water Resources of Boulder County, Colorado,
W81-01031 5B

CAIRNS, J. JR.
Asiatic Clam Invasion: Causes and Effects,
W81-01173 5C

CANTON, S. P.
Detrital Processing and Associated Macroinvertebrates in a Colorado Mountain Stream,
W81-01066 5B

CARAWAN, R. E.
Wastewater Characterization in a Multiproduct Dairy,
W81-01170 5F

CARTER, R. W.
Design and Specifications of a 500 Gallon Per Day Secondary Refrigerant Freeze Concentration Pilot Plant to Treat Aqueous-Organic Industrial Streams, Phase 1,
W81-01006 5D

CHAN, C. H.
St. Lawrence River Water Quality Surveys, 1977,
W81-01014 5B

CHANEY, R. L.
Metal Uptake by Crops Grown Over Entrenched Sewage Sludge,
W81-01100 5E

CHAPMAN, R. L.
Low-Cost Filter System Meets Drinking Water Standards,
W81-01084 5F

CHAU, A. S. Y.
Interlaboratory Quality Control Study No. 24, Analysis of Eight Acid Herbicides in Natural Fresh Water,
W81-01016 5A

CHERRY, D. S.
Asiatic Clam Invasion: Causes and Effects,
W81-01173 5C

CHRISWELL, C. D.
Concentration and Determination of Organic Acids in Complex Aqueous Samples,
W81-01067 5A

CIMERMAN, Z.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 14, NUMBER 8
APRIL 15, 1981

W81-01204 -- W81-01425
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $100; Journal and Annual Indexes, $125; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 14, NUMBER 8
APRIL 15, 1981

W81-01204 -- W81-01425

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and monthly updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SELECTED WATER RESOURCES ABSTRACTS

1. NATURE OF WATER

1A. Properties

DETERMINATION OF DEUTERIUM/HYDROGEN RATIOS IN NATURAL WATERS BY FOURIER TRANSFORM NUCLEAR MAGNETIC RESONANCE SPECTROMETRY,
Hong Kong Univ. Dept. of Chemistry.
For primary bibliographic entry see Field 7B.
W81-01244

MASS SPECTROMETRIC DETERMINATION OF DEUTERIUM IN WATER AT NATURAL LEVELS,
Australian Atomic Energy Commission Research Establishment, Lucas Heights.
For primary bibliographic entry see Field 5A.
W81-01246

2. WATER CYCLE

2A. General

HAWAIIAN GROUNDWATER GEOLOGY AND HYDROLOGY, AND EARLY MATHEMATICAL MODELS,
Hawaii Univ., Honolulu. Water Resources Research Center.
J. F. Mink, and L. S. Lau.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-157117, Price codes: A05 in paper copy, A02 in microfiche. Technical Memorandum Report No 62, September, 1980. 74 p, 11 Fig, 3 Tab. OWRT-A-077-HI(1), 14-34-0001-9013.

Descriptors: *Aquifer characteristics, *Hydrogeology, *Groundwater, *Mathematical models, Confined aquifers, Unconfined aquifers, Convection-transport phenomena, Basalts, *Hawaii, Hydraulic conductivity, Basalts, Extrusive rocks, Intrusive rocks, Ghyben-Herzberg lens, Tidal efficiency.

This report is comprised of four papers: (1) Composition and Hydrologic Character of Hawaiian Rocks, (2) Hydrologic Behavior of Hawaiian Ghyben-Herzberg Lens, (3) Critique of Early Mathematical Models, and (4) Bottom Storage: A Review of its Origin and Evolution and a Critique of its Validity. The first paper evaluates and summarizes the existing information pertaining to the hydrologic properties, including hydraulic conductivity of Hawaiian basaltic rock. The second paper evaluates and summarizes the existing factual information pertaining to the behavior of Hawaiian basal (Ghyben-Herzberg) lens. The third paper is a critique of three early mathematical groundwater models: Hoyt's mechanical testing, Wentworth's statistical correlation, and TEMPO's numerical model. The fourth paper is an assessment of Wentworth's concept on bottom storage of a thick lens. The intent of this series of papers is to provide an evaluated summary of important data, concepts, and methodologies developed in Hawaii over the many decades with particular reference to the unusual hydrologic and geologic volcanic and oceanic environments. These publications and unpublished material are scattered and generally not evaluated; many of them are not readily available. The four papers are an attempt to fill this information gap.

2C. Snow, Ice, and Frost

ICE SHEET FORMATION FROM DEPOSITED SNOW IN HIGHLY ACIDIC LAKE KATANUMA,
National Inst. for Environmental Studies, Yatabe (Japan).
K. Satake.
Japanese Journal of Limnology, Vol 41, No 2, p 68-74, April, 1980. 6 Fig, 2 Tab, 9 Ref.

Descriptors: *Ice-water interfaces, *Lake ice, *Ammonia, Nutrients, Ice cover, *Acidic water, Melt water, Snow, Lake Katanuma, Japan.

The mechanism of alternate milky ice and firm ice formation on the highly acidic Lake Katanuma (Japan) was investigated. The chemical constituents of the ice sheets and the snow in the area were similar, as were the chemical constituents of the water layers found between the ice layers and the lake water. There were chemical differences between the water and ice layers. It is suggested that first the lake water freezes, then snow is deposited on the ice sheet. The ice sheet may sink slightly under the weight of the snow, causing the water to penetrate the underside of the deposited snow. The content of ammonia in the snow and ice sheets (1.06-3.56 microgram-at/liter) was comparable to the maximum level found in the lake in April and July. These results suggest that the supply of ammonia from melted snow and ice is one of the main sources of nitrogen nutrients in the lake. (Small-FRC)

A COMPARATIVE STUDY OF MICROWAVE RADIOMETER OBSERVATIONS OVER SNOWFIELDS WITH RADIOACTIVE TRANSFER MODEL CALCULATIONS,
National Aeronautics and Space Administration, Greenbelt, MD. Goddard Space Flight Center.
A. T. C. Chang, and J. C. Shiue.
Remote Sensing of Environment, Vol 10, No 3, p 215-229, November, 1980. 12 Fig, 1 Tab, 18 Ref.

Descriptors: *Data collection, *Snowpacks, *Water sources, Water equivalent, Instrumentation, Remote sensing, Snow, Water cycle, Measurement, Radiometer, Snowmelt, Melt water, Water yield, Water supply, Runoff forecasting.

A truck-mounted microwave system experiment performed to study the microwave emission characteristics of snowpacks in the Colorado Rocky Mountain region during 1977-1978 is described. Spectral signatures of 5.0, 10.7, 18, and 37 GHz radiometers with dual polarization were measured, together with observations of snowpack density and temperature profiles, ram profile, and free water content. Data thus collected compare favorably with results calculated from microscopic scattering techniques. Variations in the snow accumulation and snow metamorphosis appeared as variations in passive microwave brightness temperatures observed by the truck-mounted radiometer. For a relatively homogeneous snowpack the microwave brightness temperatures for various microwave frequencies may be calculated with an accuracy of 5-10 K by a simple scattering model. This uncertainty translates into a 2.5-5 cm error in snow depth estimates and a 0.6-1.25 cm error in water equivalent estimates. The presence of melt water in the snowpack drastically changes the microwave emission characteristics, resulting in as much as a 50 K increase in brightness temperature over a dry cross section snow condition. The only information which it is possible to glean from that situation would be that the snowpack is in the process of melting. (Baker-FRC)
W81-01283

MODIFICATION OF THE TIDE IN THE CANADIAN ARCTIC BY AN ICE COVER,
Department of Fisheries and Oceans, St. John's (Newfoundland).
G. Godin.
Manuscript Report Series No 56, 1980. 29 p, 8 Fig, 5 Tab, 7 Ref.

Descriptors: *Arctic, *Ice cover, *Tides, *Water level fluctuations, *Canada, Bays, Straits, Climatic zones, Cold regions, Bodies of water, Surface waters, Regions, Ice, Climatology, Ice breakup, Ice-water interfaces, Water levels, Correlation analysis, Variability, Research and development, Evaluation, Harbors.

Objective criteria were sought for verification that ice cover might modify the tide in the arctic. Those tested were comparisons between: predicted tide at a local site and the observed water level (or the latter at an ice-free harbor and the local level); the mean time internal between lunar transit and local occurrence of high/low water; the power spectrum of the observed levels in various frequency bands and tide range (height difference between high and low water). None of these criteria provided an unequivocal answer. Together they indicated that the tide is unmodified at sites in good contact with the deep ocean, but modified at sites removed from the open ocean by shallows or in deep recesses of water bodies (Hudson Bay). Also, ranges appeared higher during open water and the tide arrival time was changed. Lake Harbour in Hudson Strait is unaffected; Coral Harbour and Churchill exhibit larger and later tides during the open water season. It was concluded that a seasonal change in the character of the Canadian arctic tide is a function of geography and does not affect stations lying around the perimeter of the ocean or connected to it by deep channels. (Zielinski-IPA)

2D. Evaporation and Transpiration

CROP WATER SUPPLIED BY CONTROLLED AND REVERSIBLE DRAINAGE,
Science and Education Administration, Florence, SC. Coastal Plains Soil and Water Conservation Research Center.
C. W. Doty.
Transactions of the ASAE, Vol 23, No 5, p 1122-1126, 1130, October/Novermber, 1980. 3 Fig, 2 Tab, 11 Ref.

Descriptors: *Irrigation practices, *Controlled drainage, Consumptive use, Permeability, Corn, Evapotranspiration, Soil moisture, Drainage, Soil-water-plant relationships, *Irrigation efficiency.

Corn was grown for 3 seasons on a 1.7 hectare plot using the controlled and reversible drainage system (CaRD). This method, useful in sandy loam soils with poor drainage during wet periods, was applied in this study to a moderately permeable soil not normally used for CaRD. Evapotranspiration data was determined. The estimated soil water storage was compared with the measured data obtained from tensiometer and suction release curves. These figures agreed closely enough so that it was possible to measure the water consumption of the corn crop for the 3-year period. Estimated irrigation needs were less than the water actually supplied by the CaRD system in 1975 and 1976, more in 1977. Although 1975 and 1976 crops were adequately irrigated, the 1977 crop did not receive sufficient water. Soil permeability was a limiting factor, evaportranspiration rates were very high, and tile spacings were too far apart for the climatic conditions. The CaRD system must be carefully designed if used in soils with permeability less than 3.0 meters per day because tile spacings would have to be closer than 15 m in hot, dry years. (Cassar-FRC)

W81-01369

2F. Groundwater

MEASUREMENT OF DEPTH TO WATER TABLE IN A HEAVY CLAY SOIL,
Soil Survey Inst., Wageningen (Netherlands).
J. Bouma, L. W. Dekker, and J. C. F. M. Haans.
Soil Science, Vol 130, No 5, p 264-270, November, 1980. 4 Fig, 19 Ref.

Descriptors: *Water table, *Analytical techniques, *Tensiometers, Boreholes, Clays, Measurement, Piezometry, Soil water, Instrumentation, Groundwater basins, Depth, Potentiometric level, Soil water movement, Water level recorders.

The depth to water table was determined in spring in heavy clay soils using different techniques that would allow a physical evaluation of the process involved and determination of the most desirable procedures to be used in the future. The clay soils studied were at different locations in the riverine area along the Rhine River and until about 60 yr ago had been used extensively as meadows. They were classified as Typic Fluvaquents (very fine clayey, mixed, mesic). Methods of measurement included: a 1.2-m deep perforated pipe; two series of shallow, unlined boreholes to depths of 30 and 50 cm below the surface; and one series of piezometers to 30 cm. Pressure potentials were measured in duplicate by transducer tensiometry at 10-cm depth intervals. Different water levels were noted in the unlined boreholes at the shallow depths, while pressure potentials in surrounding soil were negative. Such water levels do not qualify as water tables, but result from preferential movement of water along larger continuous voids in the shallow holes while soil mass itself is unsaturated. It was concluded that small-diameter, shallow, unlined boreholes should not be used to determine depth to water table in clay soils that have preferential pathways for water movement. A series of piezometers at different depths would give acceptable results. A series of tensiometers is particularly valuable, as it allows determination not only in saturated, but also under unsaturated conditions. Deep, unlined boreholes with a small diameter yielded acceptable values in these experiments. (Baker-FRC)

SIMULATION OF FLOW PATTERNS AND ION-EXCHANGE IN SOIL PERCOLATION EXPERIMENTS. PART I. TRACER EXPERIMENTS AND FLOW MODEL,
Norsk Inst. for Vannforskning, Oslo.
K. Brustad, and A. Njos.
Water, Air, and Soil Pollution, Vol 13, No 4, p 459-472, December, 1980. 8 Fig, 16 Ref.

Descriptors: *Mathematical models, *Percolation, *Soil water movement, Flow measurement, Model studies, Soil moisture, Tracers, Radioisotopes, *Ion exchange.

A model to study the complex flow of water in soils was developed, using the concepts of the residence time theory, and using tritiated water as a tracer in humus. These models and experimental techniques will ultimately be applied to the study of natural systems. Tracer response curves were obtained with input in the form of a step function and as a short pulse. Both methods showed similar patterns, but a smoother residence time distribution curve was obtained from the pulse response technique. Observed residence time distribution curves showed that the commonly used simple axial dispersion model is not adequate to describe the flow. Results show that 2 types of flow occur in soil systems: rapid throughflow in large to medium-sized pores and very slow flow in smaller pores. The model is mathematically simple and easy to solve with a computer, and provides a good basis for subsequent models of a more complicated nature. (Cassar-FRC)

ATTACHED AND PLANKTONIC ALGAL COMMUNITIES IN SOME INSHORE AREAS OF GREAT BEAR LAKE,
Alberta Environmental Center, Vegreville.
J. W. Moore.
Canadian Journal of Botany, Vol 58, No 21, p 2294-2308, 1980. 5 Fig, 7 Tab, 60 Ref.

Descriptors: *Algae, *Great Bear Lake(Canada), *Plankton, *Lakes, Sessile algae, Aquatic microorganisms, Aquatic plants, Standing crops, Aquatic algae, Canada, Alberta(Canada).

Species composition and standing crop of algae were determined in three areas of Great Bear Lake, Canada, during the summers of 1976-1978. Since this large, remote lake will eventually be subject to industrial development, it was desirable to determine background information to assess changes in environmental quality. Species composition and standing crop were similar in all three collection areas, because water chemistry and temperature were relatively uniform throughout the lake. Species commonly found in the epilithon were Tabellaria flocculosa, Achnanthes minutissima, and Ulothrix zonata. In the epipelon the most important species were Gyrosigma spenceri, Nitzschia obtusa, Cocconeis placentula, Amphora ovalis, and Achnanthes lanceolata. Maximum densities occurred in August or September, as follows: epilithon, 1,950,000 cells per square cm; epipelon, 4,000,000 cells per square cm. Plankton standing crops reached a maximum of 233 million to 301 million cells per cubic meter by September. Dominant species were Dinobryon bavaricum, Dinobryon sociale, Rhodomonas minuta, Cyclotella species Synedra acus var. radians, and Ankistrodesmus falcatus. All algae counts were among the lowest on record for freshwaters. Although available nutrients approach world average levels, low temperatures and violent summer storms are believed responsible for the small algae populations. Epilithon populations are different from other large North American Lakes. Epipelic compositions are similar to lakes in the western Arctic and different from lakes in Precambrian Canada and Scandanavia. (Cassar-FRC)

APPLICATIONS OF LANDSAT DATA FOR ESTIMATING PHYTOPLANKTON PRODUCTION IN LAKE CHAD (AFRICA). (APPLICATION DES DONNEES LANDSAT A L'ESTIMATION DE LA PRODUCTION DU PHYTOPLANCTON DANS LE LAC TCHAD),
Institut National de la Recherche Agronomique, Thonon-les-Bains (France).
J. Lemoalle.
Hydrobiologie, Vol 13, No 1/2, p 35-46, 1979-80. 9 Fig, 2 Tab, 31 Ref.

Descriptors: *Lakes, *Phytoplankton, *Aerial photography measurement, Reflectance, Chlorophyll, Optical properties, Remote sensing, Eutrophication, Lake Chad(Africa), *Africa, Landsat.

Lake surface radiance as measured by the Landsat satellite can be used to estimate the phytoplankton distribution and production when relationships between water transparency and chlorophyll are known. The conditions for the use of such satellite data, and application of the technique to Lake Chad (Africa) in 1975, are described. Mean gross production values in the open waters of the southern basin of the Lake Chad (an area of 1500 sq km) were estimated at 3.76 g 02 per sq m per day on June 22, 1975, and 0.91 g 02 per sq m per day on October 8, 1975. The corresponding ranges of chlorophyll concentration in mg of chlorophyll per cu m were 4-197 on June 22 and 0.8-14 on October 8. (Small-FRC)

MEASUREMENTS OF UNDERWATER SPECTRAL IRRADIANCE IN LAKE BIWA,
Kinki Univ., Osaka (Japan). Faculty of Agriculture.
R. Tsuda.
Japanese Journal of Limnology, Vol 41, No 2, p 57-67, April, 1980. 9 Fig, 2 Tab, 16 Ref.

Descriptors: *Lakes, *Optical properties, *Light quality, Opacity, Turbidity, Light intensity, Light penetration, Color, Coasts, Lake Biwa, Japan.

Secchi disk depths, beam attenuation coefficients, downward spectral irradiance, water color, and optical characteristics of the natural light field were investigated in Lake Biwa (Japan). Due to sometimes intense light absorption by suspended particulate solids, yellow suspended substances, and the water itself, both sides of the visible region of the downward spectral energy distribution were remarkably attenuated. The peaks in the spectral distribution were at about 560 nm in the south basin and at about 540 nm in the southern part of the north basin. Both basins were basically turbid coastal waters. The south basin and the north basin corresponded to optical water types 5 and 3, respectively, in Jerlov's optical classification scheme. In the lake, the value of KV (illuminance) times ZSD (Secchi disk depth) was 1.49, and the depth to which 1% of the surface illumination penetrated was 2.7 times as large as the Secchi disk depth. LIMNOLOGICAL STUDIES ON INORGANIC ACID LAKES IN JAPAN (IN JAPANESE),
National Inst. for Environmental Studies, Yatabe, (Japan).
K. Satake.
Japanese Journal of Limnology, Vol 41, No 1, p 41-50, January, 1980. 1 Fig, 87 Ref. (English abstract).

Descriptors: *Acidic water, *Limnology, *Lakes, Fish, Zooplankton, Phytoplankton, Algae, Bacteria, Water chemistry, Reviews, Japan.

A review is presented of studies of inorganic acid lakes in Japan. Lake Katanuma (1915) and Lake Onumaike (1920) were the first lakes to be investigated. The typology of acid lakes was first investigated by Ueno. The biota of acid lakes was investigated by several researchers, who found Pinnularia braunii in Lake Katanuma, Brachionus urceoralis in Lake Ichibishinaiko, Leptodictyum and fish in Lake Osoresanko, and other algae, zooplankton and insects in various acid lakes. Anzai found that the deposition of iron compounds was followed by the occurrence of Pinnularia braunii. Studies made after World War II included investigations of the chemical composition of Lake Yugama, mold and bacteria in acid lakes, phytoplankton and zooplankton in the Kirishima lakes, and macrophytes and fish in Lake Osoresanko. Total CO2 and CO2 uptake in oxic and anoxic water was measured in Lake Katanuma, and the mechanism of sulfur-diatom lamination was clarified. Changes in biota caused by the acidification of Lake Tazawako and Lake Toyako were determined. (Small-FRC)

PHOSPHORUS RELEASE FROM SEDIMENTS FROM LAKE CARL BLACKWELL, OKLAHOMA,
Oklahoma State Univ., Stillwater. School of Civil Engineering.
M. H. Bates, and N. J. E. Neafus.
Water Research, Vol 14, No 10, p 1477-1481, October, 1980. 4 Fig, 2 Tab, 19 Ref.

Descriptors: *Phosphorus, *Lakes, *Sediments, Aerobic, Anaerobic, Mixing, Sterility, Microorganisms, Dissolved oxygen, Bacteria, Lake Carl Blackwell(OK), Oklahoma.

A study was conducted in the laboratory to determine the effects of anaerobic vs aerobic conditions, sterile vs non-sterile conditions and mixing on the

release of soluble ortho-phosphate from sediments obtained from Lake Carl Blackwell, Oklahoma. Investigations were carried out for a 30-day experimental period utilizing eight laboratory systems which reflected the various combinations of the three specified environmental conditions. Phosphate release under non-sterile conditions exceeded the release observed under sterile conditions in all systems. Phosphate release in mixed systems exceeded the release in static systems in all conditions investigated. Anaerobic release of phosphates was greater than aerobic release in all except two cases. A THREE-DIMENSIONAL FIELD EVALUATION AND ANALYSIS OF WATER QUALITY IN TWO RESERVOIRS,
Tennessee Technological Univ., Cookeville. Dept. of Civil Engineering.
J. A. Gordon, and S. A. Wells.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-157083, Price codes: A08 in paper copy, A01 in microfiche. Tennessee Water Resources Research Center, University of Tennessee, Knoxville, Research Report No 79, August, 1980. 148 p, 27 Fig, 20 Tab, 120 Ref. OWRT-A-054-TENN(2), 14-34-0001-0145.

Descriptors: *Reservoirs, *Water quality, *Mathematical models, Theoretical analysis, Diffusion, Dispersion, Mixing, Physical properties, Lake morphology, Biological properties, Chemical properties, Data collections, Tennessee, *Center Hill Lake(TN), *Cherokee Lake(TN).

In formulating mathematical models for reservoir water quality, simplifying assumptions are often made with regard to the geometry of the model. For many lake and reservoir models, the assumptions of one-dimensionality (i.e., water quality changes are significant only in one dimension-usually depth), as well as two-dimensionality (considering the length and depth of the water body), have been utilized to predict water quality. In both cases, the assumption of lateral homogeneity is made. A field study was undertaken to determine the change of water quality in the lateral dimension. The main study reservoir was Center Hill Lake in Middle Tennessee. Data were also obtained for Cherokee Lake in East Tennessee. Several water quality parameters were analyzed over the length, breadth, and depth of these reservoirs from pre-stratification through post-stratification: temperature, dissolved oxygen, pH, conductivity, oxidation-reduction potential. The statistical and theoretical three-dimensional analysis showed the expected variation for each water quality parameter in each direction. The influence of the lateral dimension on water quality management and modeling was found to be negligible.

2J. Erosion and Sedimentation

SEDIMENT PRODUCTION OF ALLUVIAL CHANNELS IN RESPONSE TO BASE LEVEL LOWERING,
Geological Survey of Israel, Jerusalem.
Z. B. Begin, D. F. Meyer, and S. A. Schumm.
Transactions of the ASAE, Vol 23, No 5, p 1183-1188, October/November, 1980. 9 Fig, 3 Tab, 15 Ref.

Descriptors: *Base level, *Sediment discharge, *Alluvial channels, *Drainage, Running waters, Sediment load, Suspended solids, Mathematical models, Sediment transport.

An experimental study of the degradation of alluvial channels in response to base level lowering was carried out in flumes 15 meters and 20 meters long at slopes of 1%. Sediment discharge was measured and a power function decay of sediment discharge with time with an exponent close to -0.5 was noted. An equation was developed from the data to describe sediment discharge. Variables included mean width and initial constant slope of the channel and amount of base level lowering. Channel armoring, which produced an abrupt decrease in sediment discharge, was a prominent effect during the runs. The equation was extended by computer simulation to a simple drainage net. Location of tributaries had a marked effect on the amount of sediment produced as a function of base lowering. (Cassar-FRC)

CHARACTERISTICS OF ERODED SEDIMENT.
Science and Education Administration, Morris, MN.
R. A. Young.
Transactions of the ASAE, Vol 23, No 5, p 1139-1142, 1146, October/November, 1980. 3 Fig, 3 Tab, 32 Ref.

Descriptors: *Sedimentology, *Soil aggregates, *Erosion, Sediment sorting, Slopes, Soil erosion, Particle size.

Eroded sediments are characterized to develop guidelines to use in sediment prediction models. Data from the literature and from unpublished recent studies are reviewed and summarized. Soil particle detachment and transport depends on particle size distribution, density, and degree of aggregation of the matrix soil. Clay and silt aggregates in the 20 to 200 micrometers range are more erodible than larger or smaller particles. Very sandy soils, not well aggregated, erode as primary particles, with the sediment particle size distribution similar to that of the matrix. Soils composed of greater than 50% sand or clay produce sediment with particles larger than 50 micrometers. High clay soils form a considerable amount of sediment particles larger than 1000 micrometers. Soils high in silt produce sediment largely in the 20 to 35 micrometer range. Aggregate density averages about two thirds that of primary particles and varies inversely with the amount of silt in the soil. Vegetative cover affects the particle size of eroded material, generally increasing fines and decreasing coarse particles as cover increases. However, tillage practices affect these relationships and should be further studied. Percentage of coarse material (greater than 50 micrometers) transported increases with slope up to 10%, then remains constant to the highest level tested, 32%. (Cassar-FRC)
W81-01275

SAND BED INSTABILITY DUE TO BED LOAD MOTION,
Kyoto Univ. (Japan). Dept. of Civil Engineering.
H. Nakagawa, and T. Tsujimoto.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 106, No HY12, p 2029-2051, December, 1980. 13 Fig, 1 Tab, 25 Ref.

Descriptors: *Model studies, *Movement, *Bed load, Flow rates, Stochastic processes, Sand bars, Dunes, Waves, Sediments, Suspended solids, Sand waves, Geology, *Sediment transport, Sediment load, Fluctuations, Hydraulics.

Previous research has illustrated that the lag of sediment transport for bed form has a great impact on sand bed instability. As of yet this lag has not successfully been quantitated. The present study seeks to clarify the role and constitution of the lag by examining the instability analysis and comparing it with theories on the process of bed load transport rate. The applicability of this model was verified by devised experiments using a movie camera and a film motion analyzer. The flow model based on potential flow theories has been improved by taking into account the effect of flow acceleration or deacceleration, which may be represented by local fluctuations in flow depth. This allows estimations of the phase lag between bed shear stress and bed form to be made. Investigations into the relationships between bed surface instability and hydraulic conditions were also carried out. Results confirmed those of previous investigators, but no added information was gained on the formation of antidunes migrating downstream. (Geiger-FRC)

PROCESS AND PLANT FOR THE RECOVERY OF WATER FROM HUMID AIR,
Maschinenfabrik Augsburg-Nuernberg (Germany, F.R.). (Assignee).
W. Bulang.
U.S. Patent No 4,197,713, 4 p, 2 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 993, No 3, p 792, April 15, 1980.

Descriptors: *Patents, *Meteoric water, *Water vapor, Precipitable water, Humidity, Adsorption, Heat exchangers, Condensation, Heat, Equipment.

A process and a plant for the recovery of water from humid air are disclosed. Humid ambient air flows through an adsorber in which an adsorbing agent removes moisture from the air by adsorption. Subsequently, air heated by an air heater and delivered by a fan flows through the adsorber in order to recover by desorption the moisture. Then the water vapor containing air is precooled in a counterflow heat exchanger and subsequently conducted into a condenser in which heat is extracted from it by means of a heat pump so that the water vapor condenses and is available in the form of liquid water. The air cooled and dried in the condenser is utilized in the counterflow heat exchanger for precooling the air fed into the condenser. The heat given off by the heat pump is supplied to the air heater in order to be utilized for heating the air flowing through the air heater. (Sinha-OEIS)

2L. Estuaries

THE SIGNIFICANCE OF THE ENTRAPMENT ZONE LOCATION TO THE PHYTOPLANKTON STANDING CROP IN THE SAN FRANCISCO BAY-DELTA ESTUARY,
Water and Power Resources Service, Sacramento, CA.
J. F. Arthur, and M. D. Ball.
Report, November, 1980. 101 p, 28 Fig, 6 Tab, 38 Ref.

Descriptors: *Estuaries, *Phytoplankton, *Standing crops, *Euphotic zone, California, Diatoms, Settling velocity, Inflow, Chlorophyll, Inorganic compounds, Nutrients, Water chemistry, Specific conductivity, *San Francisco Bay-Delta Estuary.

A study conducted during the summer of 1978 in the upper San Francisco Bay-Delta Estuary of California further supported the theory that phytoplankton standing crops are highest when the entrapment zone is adjacent to the expansive shallows of Suisun Bay. The photic zone in the shallows of Suisun Bay constitutes a greater percentage of the total depth than in the channels. The entrapment zone was maintained in Suisun Bay from mid-July through October 1978 by regulating Delta outflow through operational control of the Federal and State water projects. Maximum phytoplankton concentrations occurred when the tidally averaged position of the entrapment zone was in the vicinity of Honker Bay. Delta outflows of 140 to 230 cubic m/s were required to maintain the entrapment zone in this location. Forty-one species of phytoplankton were identified, with the diatom Thalassiosira excentricus being the most numerous. The settling rate of T. excentricus is nearly equal to the maximum net upward vertical velocity in the water column. The settling of the diatom from the downstream-flowing surface layer into the upstream-flowing bottom layer is the theorized mechanism by which these organisms are concentrated in the entrapment zone. High chlorophyll concentrations, as well as the lowest inorganic nitrogen and orthophosphate levels, were observed in water with specific conductances of 5-14 millimho/cm. Results indicate that the phytoplankton standing crop in Suisun Bay can be regulated, within water availability limits, by manipulating Delta outflow to optimize the entrapment zone location. REEXAMINATION OF THE WATER CHEMISTRY AND PLANKTOLOGY OF A DELAWARE TIDAL STREAM AS RELATED TO ITS FLUSHING CHARACTERISTICS,
Delaware Univ., Newark. Coll. of Marine Studies.
F. C. Daiber, E. M. Simek, and M. Van House.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-157091, Price codes: A04 in paper copy, A01 in microfiche. Water Resources Center, University of Delaware Technical Completion Report, November, 1980. 57 p, 16 Fig, 3 Tab, 44 Ref, 3 Append. OWRT-A-044-DEL(1), 14-34-0001-0108.

Descriptors: *Zooplankton, *Water chemistry, Water quality, Hydrography, *Delaware Bay, Estuaries, Sewage pollution, Flushing time, Tidal streams, Nutrients, *Tidal effects, *Murderkill River estuary.

In the early 1970's, the zooplankton communities of the Murderkill and Broadkill Rivers were investigated and found to be different. At that time, the Murderkill was an unperturbed system whereas the Broadkill received considerable point source pollution. It was concluded that water quality degradation in the Broadkill was responsible for the observed differences in the zooplankton communities. Since 1973, the Kent County Regional Sewage Treatment Plant (STP) has been discharging nutrients and biodegradable material into the Murderkill River. Based on the earlier study, it was predicted that the zooplankton community in the Murderkill would since have shifted toward that which was found in the Broadkill. The present investigation, a reexamination of the water quality and zooplankton community of the Murderkill, was conducted to test this hypothesis. Statistical comparisons of water quality data between the previous and present studies show that water quality has changed since the STP began operating. Ammonium and nitrite concentrations have increased significantly below the plant, and dissolved oxygen has decreased. Phosphate and nitrate concentrations increased both upstream and downstream of the plant. Changes in chlorphyll-a concentrations were inconclusive. In general, the composition of the zooplankton community has remained relatively stable since the STP began operations. Specific changes in species composition associated with the water quality degradation on the Broadkill River did not occur on the Murderkill, nor were there any of the changes associated in the literature with the classic conditions of eutrophication.

3C. Use Of Water Of Impaired Quality

EXTENDED USE OF TREATED MUNICIPAL WASTE WATER BY THE BUCKEYE IRRIGATION COMPANY: A DOCUMENTATION OF EFFECTS,
Arizona Water Resources Research Center, Tucson.
C. B. Cluff, T. C. Tucker, A. D. Day, J. A. McFadyen, and P. G. Sebenik.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-156630, Price codes: A03 in paper copy, A01 in microfiche. Completion Report, September, 1980. 29 p, 6 Fig, 19 Tab, 3 Ref, 2 Append. OWRT-A-050-ARIZ(4), 14-31-0001-5003.

Descriptors: *Waste water disposal, *Municipal wastes, Irrigation water, *Irrigation practices, *Cost-benefit analysis, Farm prices, Irrigation programs, Irrigation systems, Irrigated land, Irrigation efficiency, Water utilization, Waste water treatment, Environmental sanitation, Nitrates, Groundwater, Profit, Water costs, Water sources, Water supply, *Water reuse, Arizona.

The treated effluent use by the Buckeye Irrigation Company is the largest in the State of Arizona. It is unique in that it is used by an irrigation district. This two-year study addressed three objectives: (1) identify changes during an extended period of application of treated waste water to irrigated fields (in irrigation and fertilization practices, cropping patterns, crop yield response/equality, irrigation water quality, and soil properties); (2) make a preliminary evaluation of the effects of effluent use on groundwater conditions; and (3) make a preliminary evaluation of changes in water costs and farm profits. Most of these initial objectives were achieved. Groundwater nitrate concentration showed an accelerating increase possibly due to continued use of fertilizer practice during waste water use. In general, more nitrate-nitrogen was deposited on pump water irrigated fields than on fields irrigated with waste water-pump water mixtures, while the latter provided higher total nitrogen due to waste water organic nitrogen. Pump-waste water use generated considerably less total soluble salts and about 4 parts-per-million phosphorus. Little or no change occurred in irrigation or fertilization practices, or in cropping patterns. Waste water use varied from 100% in winter to about two-thirds of the crop demand in the summer. (Zielinski-IPA)

TREATMENT AND DISPOSAL OF SUGARBEET PROCESSING WASTE WATER BY IRRIGATION,
Science and Education Administration, Kimberly, ID. Snake River Conservation Research Center.
J. H. Smith, and C. W. Hayden.
Science and Education Administration, Department of Agriculture, Conservation Research Report No 25, September, 1980. 59 p, 3 Tab, 32 Ref, 1 Append.

Descriptors: *Irrigation, *Waste water treatment, *Waste water disposal, *Food processing industry, Industrial wastes, *Water reuse, Flood irrigation, Idaho, Alfalfa, Grasses, Soil chemistry, Soil water, Water chemistry, Nitrates, Chemical oxygen demand.

Irrigation with sugarbeet processing waste water was studied at three locations in Idaho for 2 or 3 years where perennial grass and alfalfa were irrigated by flooding specially graded fields. Experimental sites were scheduled for irrigation at intervals of 1, 2, or 4 weeks. The weekly irrigated plots were discontinued after 1 year because of excess loading. Waste water samples from the sugar factories and water samples extracted from the soil at depths of from 15 to 150 cm were analyzed for chemical oxygen demand, total nitrogen, phosphorus, potassium, electrical conductivity, calcium, magnesium, sodium, sodium absorption ratio, pH, chlorine, sulfate, and bicarbonates. Soil and plants were also analyzed for selected constituents. Water applications range from 28 to 201 cm/year and chemical oxygen demand applications ranged from 8 to 140 metric tons/hectare. Chemical oxygen demand reductions in the waste water at Twin Falls averaged 48% in winter and 98% in summer; at Rupert, it averaged 84% in winter and 98% in summer; and at Nampa, it averaged 75% in winter and 88% in summer. Nitrates found in water samples extracted from 150 cm in the soil were mostly below 10 parts per million. Irrigation with sugarbeet processing waste water works well in the field. (Moore-SRC)
W81-01220

DAIRY OPEN LOT AND LAGOON-IRRIGATED PASTURE RUNOFF QUANTITY AND QUALITY,
North Carolina State Univ. at Raleigh. Dept. of Biological and Agricultural Engineering.
P. W. Westerman, and M. R. Overcash.
Transactions of the ASAE, Vol 23, No 5, p 1157-1164, 1170, October/November, 1980. 6 Fig, 13 Tab, 20 Ref.

Descriptors: *Farm wastes, *Agricultural runoff, *Rainfall-runoff relationships, Dairy industry, Pasture management, Farm lagoons, Nitrogen, Ultimate disposal, Waste water disposal, Water pollution, Runoff, *Irrigation water.

The quality and quantity of rainfall runoff from a dairy open lot and a pasture irrigated with water from dairy lagoon effluent (1 cm every other week) were determined. Over a 30-month period 21% of rainfall on the open lot became runoff and 10% on the pasture. Average nitrogen runoff yield was 234 kg per hectare-year in the lot and 24.8 kg per hectare-year in the pasture. Of 936 kg nitrogen per hectare applied to the pasture during a year, 2.6% was transported. Compared with previous data for beef feedlots and dairy lots of higher stocking density, nutrient concentrations in the lot were lower. Runoff concentrations from the pasture compared with data obtained elsewhere for plots receiving similar loadings of animal wastes. In general, concentrations of nitrogen, phosphorus, total organic carbon, and chloride were 4 to 6 times greater in the lot runoff than in the pasture runoff. (Cassar-FRC)

PRELIMINARY INVESTIGATIONS INTO THE EFFECTS OF REFINERY WASTE WATER, AND THE SINGLE EFFECT OF ITS MAJOR POLLUTANTS ON COMMERCIALLY INTERESTING CROPS,
G. A. Al-Nakshabandi, Z. Hameed, A. Abdulhadi, and B. Saleem.
Progress in Water Technology, Vol 12, No 3, p 109-117, 1980. 4 Fig, 2 Tab, 4 Ref.

Descriptors: *Crop response, *Industrial water, *Oil industry, Phenols, Oil, Barley, Corn, Alfalfa, Vegetable crops, Hydrogen sulfide, Ammonia, Refinery wastes, Irrigation practices, Water reuse.

The effects of refinery waste water and irrigation water containing NH3, H2S, oil, and phenol on commercial crops were investigated. Corn, barley, alfalfa, and radish were irrigated with solutions containing varying amounts of one of the pollutants, or with a dilution of API separator discharge from KNCP. Germination of the field crops was not affected by any of the pollutants; however, radish germination was retarded by 100% and 75% solutions of refinery waste water. Growth rates of radish, barley, and corn did not differ significantly from controls under all treatments. Alfalfa was affected. Thus, most crops tolerated the different types and concentrations of pollutants, except for heavily polluted waste water used in one test. (Small-FRC)

WASTE HEAT UTILIZATION THROUGH SOIL HEATING,
Cold Region Research and Engineering Lab., Fairbanks, AK.
T. McFadden, and J. Buska.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 105-117. 8 Fig, 1 Tab, 13 Ref.

Descriptors: *Alaska, *Cold regions, *Agricultural enhancement, *Soil heating, Powerplant cooling water, Plant growth, Crop response, Crops, Vegetable crops, Beans, Lettuce, Sweet corn, Ice fog, Growing season, Cooling water, Water reuse.

Warm cooling water discharged from the Fort Wainwright powerplant near the University of Alaska was used for agricultural enhancement by soil heating. Despite long hours of daylight, the growing season in the far north is severely restricted by cold soil temperatures. Warmer soil allows the growth of several warm season crops not normally possible in Alaska, and increased yield on crops normally grown. Two test plots and a control plot were prepared. The test plots had buried heating pipes that used 2,000 gallon per minute of diverted power plant cooling water. The diverted

water had a temperature range of 10 to 38C. Results of harvested crops show that the heated plots outproduced the unheated control plot in every case except for one species of lettuce. Crops tested include sweet corn, broccoli, cauliflower, lettuce, spinach, beans, peas, and zucchini. Increased crop yields as high as 425% were obtained with corn and multiple harvests were possible with some crops. An added advantage of this use of waste heat from powerplant cooling water is the reduction of the ice fog caused during the winter months in the vicinity of cooling ponds. 3D. Conservation In Domestic and Municipal Use

MONO LAKE, CALIFORNIA: SAVING A LAKE OR SERVING A CITY,
Wisconsin Univ.-Madison. Dept. of Geography.
T. R. Vale.
Environmental Conservation, Vol 7, No 3, p 190-192, Autumn, 1980. 2 Fig, 1 Tab, 13 Ref.

Descriptors: *Water utilization, *Los Angeles aqueduct, *Water conservation, Lakes, Irrigation, Potable water, Environmental effects, Aqueducts, Migratory birds, Waterfowl, Aquatic life, Water demand, Water resources development, Surface water availability, Saline lakes, Water quality.

Completion of the Los Angeles Aqueduct in 1913 caused the level of the Mono Lake waters since then to drop by about 15 meters. The surface area of the lake has decreased by nearly 50%, and an island in the lake which supports nesting California gulls has connected with the mainland, exposing the colony to predation. Los Angeles officials insist that the present water use rate from the aqueduct is necessary to serve the domestic needs of the residents of the city. Environmentalists fear that decreased water levels will cause fluctuations in lake populations of brine shrimp and brine flies, which form an important part of the diet of migratory and nesting birds of the Mono Lake area. Several environmental groups have endorsed plans to reduce water exports from the lake to 18 million cubic meters per year. This would constitute a reduction of 110 million cubic meters of water per year, or 14% of the water supply now consumed by the 3 million residents of Los Angeles. Much more water is used for agricultural irrigation than for domestic purposes. Recent studies have shown that water demand often depends on water availability, and voluntary practices of water conservation by Southern California residents have yielded decreases in water consumption greater than that which would have resulted from imposed rationing. Discussions on the more efficient use of urban water supplies are included. (Geiger-FRC)
W81-01255

WATER AND ENERGY CONSERVATION ALTERNATIVES FOR THE NORTH,
Environmental Protection Service, Edmonton (Alberta).
J. J. Cameron, and B. C. Armstrong.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 47-88. 5 Fig, 10 Tab, 32 Ref.

Descriptors: *Northwestern Territories, *Canada, *Cold regions, *Water conservation, Public health, Education, Toilets, Showers, Bathing, Hot water, Plumbing, Economic efficiency, Water demand, Water consumption, Water reuse.

A comprehensive study conducted by the Government of the Northwestern Territories shows that water use can be significantly reduced by public education. Prudent application and acceptance of water conservation methods can improve the level of service and sanitation in northern areas more rapidly than earlier thought possible. Extensive tables and discussion are given on toilet modification alternatives, toilet alternatives, bathing alternatives, laundry alternatives, and miscellaneous water conservation alternatives. Toilets use more water than any other home fixture. The economics of various water conservation devices is determined by the reduction in water demand and energy costs for hot water heating. An analysis of a four-person household recommends a dual flush and dam toilet, low flow shower heads, front load washers, and insulated hot water pipes. Recommendations vary according to the type of water supply system used, either a piped system or a trucked system. Since the cost of trucked service is directly related to water consumption, a reduction in demand will change the economic attractiveness of such trucked systems. (See also W81-01381) (Seigler-IPA)

3F. Conservation In Agriculture

YIELD RESPONSE OF CORN RELATED TO SOIL MOISTURE,
Minnesota Univ., St. Paul. Dept. of Agricultural Engineering.
R. V. Morey, J. R. Gilley, F. G. Bergsrud, and L. R. Dirkzwager.
Transactions of the ASAE, Vol 23, No 5, p 1165-1170, October/November, 1980. 3 Fig, 6 Tab, 12 Ref.

Descriptors: *Corn, *Crop response, *Irrigation practices, Soil moisture, Soil-water-plant relationships.

The response of corn to sprinkler irrigation was studied for 3 seasons, 1973-1975, on a Hubbard loamy sand at Elk River, Minnesota. The 4 treatments in 1973 were scheduled on a moisture depletion basis as follows: no irrigation, and irrigation when soil moisture dropped to 25%, 50%, and 75%. The irrigated crop yield was about twice the nonirrigated crop yield, but there was little variation in results among the 3 irrigation treatments. The 1974 and 1975 treatments were based on fixed intervals and amounts of water. Corn yield was poor in the nonirrigated treatment and was greater with increasing amounts of water applied. Gravimetric soil moisture measurements were used to further validate a soil moisture budget model. Computed and measured moisture contents agreed well. This model provided estimates of transpiration ratio and yield response functions. (Cassar-FRC)

MULTIPLE CHAMBER DRIP IRRIGATION HOSE,
W. A. Delmer.
U.S. Patent No 4,196,853, 8 p, 14 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 993, No 2, p 507, April 8, 1980.

Descriptors: *Patents, *Irrigation, *Application equipment, Irrigation efficiency, Irrigation practices, Irrigation operation and maintenance, *Drip irrigation.

A multiple chamber drip irrigation hose has a primary and at least one secondary tube of flexible, water-impermeable material and is joined at a common wall. The common wall has a series of first holes placing the interior of the primary tube in communication with the interior of the secondary tube. The secondary tube has a series of second holes leading from the interior of the secondary tube to the exterior. A flexible filamentary line, ridge or groove is positioned within the secondary tube and forms a restricted path for water flowing from a first hole to a second hole. The apparatus compensates for varying pressures in the water supply and will automatically flush or blow out each time the water is turned on. (Sinha-OEIS)

4. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control Of Water On The Surface

TEMPORARY DETENTION CUTS STORM FLOW PEAKS,
Metropolitan Sanitary District of Greater Chicago, IL.
A. Talhami.
Civil Engineering-ASCE, Vol 50, No 12, p 72-75, December, 1980.

Descriptors: *Storm runoff, *Storm drains, *Urban hydrology, Storm sewers, Water storage, Urban runoff, Weirs, Cities, Stormflow, Sewers, Intakes, Pipes, Detention reservoirs, Pondage, Storage.

Methods of providing on-site temporary detention of stormwater runoff are discussed. These are useful in the design of urban drainage systems, for reducing peak rates of discharge from storm sewers. All designs are based on inflow in excess of outflow. They are sited upstream from any physical constraints such as culverts, and have a peak discharge which is limited by the hydraulic capacity of the constraints. Methods include detention basins, ponds, detention lakes, parking lots, underground structures, roof storage, crushed stone beds and surface storage in open spaces. Controlled release rates can be achieved by designing pipes with smaller diameters and by installing roof restrictors, weirs, and outlet structures in the middle of ponds. Such detention facilities are gaining increased acceptance as flood control measures. (Titus-FRC)

HYDROLOGIC INVESTIGATION, DESIGN, AND CONSTRUCTION OF FLOOD CONTROL STRUCTURES, COPPERHILL, TENNESSEE,
Dames and Moore, Denver, CO.
U. Kappus, C. L. Zimmerman, and T. Turner.
Mining Engineering, Vol 32, No 10, p 1504-1509, October, 1980. 6 Fig, 1 Tab, 14 Ref.

Descriptors: *Dam design, *Flood control, *Safety, Construction, Diversion, Hydrograph analysis, Conduits, Mining, Tennessee.

A project is described which was designed to divert flood flows of the North Potato Creek from the Cherokee ore body (Copperhill, Tennessee). Hydrologic studies were performed, and hydrographs were developed for possible floods. Computer simulations were performed for required dam height and overflow tunnel diameter. The project consisted of: a 28 m dam and a 9 m outlet conduit, an emergency spillway, and a 4 m diameter hard rock transbasin diversion tunnel. Design studies consisted of: site conditions, laboratory testing of soils and rock, embankment design, internal drainage, outlet conduit, and emergency spillway. Construction of the project is described. The flood management system is part of the Cities Service Co. mine safety program for the Cherokee ore body, which is partically located within the creek channel. (Small-FRC)

WATERCOURSE IMPROVEMENT STRATEGIES FOR PAKISTAN,
Colorado State Univ., Fort Collins.
J. O. Reuss, G. V. Skogerboe, and D. J. Merrey.
Water Supply and Management, Vol 4, No 5/6, p 409-422, 1980. 2 Fig, 2 Tab, 21 Ref.

Descriptors: *Water conveyance, *Water policy, *Pakistan, Water management, Water loss, Irrigation canals, Water conservation, Estimated costs, Planning, Water institutions, Watercourse improvement.

Losses of water from Pakistan's more than 80,000 watercourses reach at least 35-45%. Seepage and visible leaks from unimproved channels are a

major source of these losses. A combination of three major strategies for improvement is recommended. The cheapest method, at a cost of 33 rupees per acre foot and minimum investment, is heavy cleaning and maintenance, which involves removal of excessive vegetation and rebuilding banks. A second strategy entails lining channels with brick and mortar in areas of heavy traffic and water loss. Cost estimates are 70 rupees per acre foot. The third method, completely and properly lined channels, can save 95% of water losses at a cost of 124 rupees per acre foot and a large initial investment. These three methods may be used in combination, considering that the value of water saved in each locale determines the logical conservation method. The authors favor a decentralized administrative organization with local farmers participating in decisions and construction programs. A possible practical approach for reducing water losses in Pakistan courses would be immediate wide-scale implementation of the cleaning and maintenance strategy and formation of local Water Users Associations. More extensive improvements should be made where water costs and benefits justify them. (Cassar-FRC)
W81-01334

AQUATIC WEED CUTTER,
E. R. Donnelley.
U.S. Patent No 4,196,566, 8 p, 14 Fig, 15 Ref; Official Gazette of the United States Patent Office, Vol 993, No 2, p 410, April 8, 1980.

Descriptors: *Patents, *Water control, *Aquatic weeds, *Aquatic weeds, *Aquatic weed control, Equipment, Channels, Channel improvement, Weed cutter.

An aquatic weed cutter for cutting aquatic plants and root systems includes a water vehicle having a drive system connected to at least two shafts that project out of the vehicle. Each shaft has a circular cutting blade mounted at the distal end of the shaft. The cutting blades are positioned for rotation in a generally vertical plane for cutting as well as for propelling the vehicle through the water. The drive system is also used to control the position of the shafts below the surface of the water in order to position the tips of the cutting blades at various distances below as well as above the surface of the water bed. The shafts are positioned from one another in order to provide an overlapping relationship between each cutting blade. A forward cleaning blade is placed forward of each of the cutting blades with teeth having leading and trailing pitched portions to keep the cutting blades clean of debris. (Sinha-OEIS)

4B. Groundwater Management

INDIGENOUS RESOURCES AND WATER SUPPLY MANAGEMENT,
International Labour Organization, Geneva (Switzerland). Employment and Development Dept.
M. I. Hussain.
Water Supply and Management, Vol 4, No 4, p 201-219, 1980. 1 Fig, 6 Tab, 28 Ref.

Descriptors: *Irrigation programs, *Employment, *Water supply development, *Egypt, Manpower, Labor, Future planning, Water resources development, Water management, Equipment, Irrigation design, Crop production.

Arguments are presented which support the contention that provisions of irrigation increase job opportunities by expanding agricultural potentials and by utilizing manpower to work on irrigation system construction and maintenance. Irrigation has been shown to affect labor use by increasing cropping intensity, allowing shifts in crop patterns, and encouraging farmers to use high yield varieties. The work generating processes involved in preparing land for successful irrigation include leveling of land, digging of irrigation channels, and building of drainage systems. Each process is discussed with emphasis on its implementation in Egypt, along with manpower labor requirements. Small scale irrigation projects can generally be performed by unskilled laborers with locally manufactured equipment. Some small scale surface water and groundwater projects are discussed in relation to their ability to provide irrigation water and generate jobs. Although small scale projects are useful in serving immediate needs, they are often accused of being unreliable and of low quality, and of using inferior materials. The large-scale irrigation projects play an integral part in the economic growth of a nation. They are long term affairs employing more skilled employees, better technologies and more durable materials and equipment. To aid in deciding which type of labor intensive technology would be appropriate for developing countries, the World Employment Program has initiated a 'Development and application of appropriate technology for irrigation works' program. (Geiger-FRC)

DETERMINING IMPACT OF IRRIGATION ON GROUNDWATER,
Youngstown State Univ., OH. Dept. of Civil Engineering.
I. A. Khan.
Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol 106, No IR 4, p 331-334, December, 1980. 9 Fig, 2 Tab, 23 Ref.

Descriptors: *Irrigation practices, *Agricultural engineering, *Environmental effects, Soil-water-plant relationships, Irrigation engineering, *Groundwater, Mathematical models, Groundwater resources, Irrigation systems, Arable land, Irrigation effects, Irrigable land, Water injury, Irrigation, Subsurface waters, Percolating water, Water table, Water quality.

Irrigation may adversely modify the soil and groundwater for the growth of most crops and eventually lead to the destruction of the irrigated system. However, careful planning and management may delay destruction. Salination is one symptom of potential destruction. A modeling procedure is described which inexpensively predicts groundwater quality as a result of present and future irrigation and agricultural practices. Specifically, the model predicts ionic distribution of irrigation return flows. It determines the effect of varying the leaching fraction on the quality of return flows and the effects of pumping and irrigation application schemes on the quality and quantity of groundwater. In addition, it predicts the effect of land use and cropping pattern changes on groundwater quantity and quality. (Titus-FRC)
W81-01370

4C. Effects On Water Of Man's Non-Water Activities

CHARACTERIZATION OF STORM RUNOFF IN LAS VEGAS VALLEY, NEVADA,
Nevada Univ. System, Reno. Water Resources Center.
J. W. Hess, and D. E. Zimmerman.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-156663, Price codes: A04 in paper copy, A01 in microfiche. Publication No 41067, 1980. 57 p, 8 Fig, 6 Tab, 8 Ref. 5 Append. OWRT-A-084-NEV(1), 14-34-0001-8030.

Descriptors: *Storm runoff, *Salinity, *Urbanization, *Water quality, *Dissolved solids, Runoff, Rainfall intensity, Flash floods, Floods, Arid climates, Topography, Data collections, Las Vegas Valley basin(NV), Las Vegas(NV), *Nevada.

The total salinity of storm runoff is an important consideration. Public law 93-320 entitled the 'Colorado River Basin Salinity Control Act' has designated several sites, including Las Vegas Wash, for salinity control measures. A potentially significant salt load source is storm runoff. The purpose of this research was to develop background data on the chemical characteristics of storm runoff in Flamingo Wash, Las Vegas Valley. Seven runoff events were sampled at four sites along Flamingo Wash during the period of October 1977 through October 1978. Precipitation occurs from two types of events, both of which will produce runoff. Winter frontal storms produce large areas of low intensity rainfall, but can produce large totals. Summer precipitation results generally with precipitation amounts greater than 0.25mm with about 37% of these events being greater than 6.25mm. Approximately 15 thundershowers per year occur in the valley. Storm runoff from Flamingo Wash is apparently not an important source of salt loading to the Colorado system. In general, observed TDS during runoff events was less than 1000 mg/l.

REVIEW AND EVALUATION OF URBAN FLOOD FLOW FREQUENCY PROCEDURES,
Science and Education Administration, Beltsville, MD. Hydrology Lab.
W. J. Rawls, V. Stricker, and K. Wilson.
Bibliographies and Literature of Agriculture No 9, August, 1980. 65 p, 3 Tab, 1 Append.

Descriptors: *Flood flow, *Flood frequency, *Urbanization, *Model studies, Storm runoff, Urban runoff, Watersheds(Basins), Statistical models, Urban hydrology, Surface runoff, Rational formula, Mathematical studies, Urban drainage, Floods, Precipitation(Atmospheric).

Man's impact through urbanization causes a dramatic effect on the flood response of a watershed Usually, the introduction of impervious surfaces and improved drainage systems increases the amount of runoff and reduces flow travel times, producing a flood hydrograph of increased magnitude that is quicker to rise and recede. This report evaluates 128 published and unpublished papers (1962 to 1979) on urban flood flow frequency estimation procedures. The procedures are separated into three classes: statistical estimation of peak flow, single storm event, and continuous record. The literature does not adequately reflect what procedures are currently being used, but instead contains many articles on experimental models that have been designed for a specific region or a specific problem. Also, many of the single event and continuous record models reported were modified versions of previously reported models. Most of the models in the single event and continuous record categories could be applied regionally or nationally; however, no models in the statistical estimation of peak flow category, except perhaps the rational formula, had regional or national applicability. (Moore-SRC)

4D. Watershed Protection

EROSION BY CIRCULAR WALL JETS IN CROSS FLOW,
Alberta Univ., Edmonton. Dept. of Civil Engineering.
N. Rajaratnam.
Journal of the Hydraulics Division Proceedings of the American Society of Civil Engineers, Vol 106, No 11, p 1867-1883, November, 1980. 12 Fig, 1 Tab, 15 Ref.

Descriptors: *Erosion rates, *Waste water disposal, Laboratory tests, *Turbulent flow, Effulents, Scour, Flow, Nozzles, Rivers.

The erosion caused by circular turbulent wall jets used to discharge effluents into rivers was examined. One jet with a diameter of 0.50 inch (12.7 mm) was evaluated in a wind tunnel using three weights of sand and one of polystyrene. A water-sand system was evaluated in the hydraulics laboratory using a 0.5 inch (12.7 mm) nozzle and sand. Equations are derived to estimate erosion under various conditions. A strong interaction was found between jet and cross flow. The maximum erosion was located nearer to the nozzle when there was cross flow. The profile of the eroded bed was similar if analyzed separately for the scour hole and ridge regions. (Small-FRC)

5. WATER QUALITY MANAGEMENT AND PROTECTION

5A. Identification Of Pollutants

BACTERIOLOGICAL AND NUTRIENT STUDY OF MAJOR SURFACE WATERS IN BANFF NATIONAL PARK.
Inland Waters Directorate, Ottawa (Ontario).
Technical Report WQB-79-5, December, 1979. 60 p, 9 Fig, 13 Tab, 6 Ref, 1 Append.

Descriptors: *Surface waters, *National parks, *Water quality, *Canada, *Nutrients, *Aquatic microorganisms, Aquatic life, Recreation facilities, Natural resources, Facilities, Recreation, Water pollution, Water pollution sources, Lakes, Lagoons, Microorganisms, Analysis, Testing, Evaluation, Water analysis, Bacteria, Coliforms, *Banff National Park(Alberta).

The quality of surface waters in Banff National Park, located about 112 km west of Calgary in the eastern ranges of the Rocky Mountains, was studied in 1975 and 1976. The study documents the existing quality of a number of surface waters within the Park, and indicates that the quality of the Bow River, Louise Creek, Sunshine Creek, Forty Mile Creek, and the Spray River are degraded by human activities. Effluent releases from lagoons at Lake Louise and Banff were found to increase nutrient levels and bacteria populations in the Bow River. Louise Creek quality is impaired by effluent releases from the upper sewage lagoon and by discharge from the Chateau Lake Louise heating plant. Forth Mile Creek quality was adversely affected by effluent releases from the septic system serving the Banff Recreation Center. Septic wastes are now directed to the Banff townsite sewage system. Bacteriological counts showed that fecal material intermittently enters the low reaches of the Spray River from an unidentified source. Bow Lake and Lake Minnewanka had good quality with no apparent effect from lake shoreline development. Salmonella and Shigella pathogenic bacteria were absent in all study samples tested. (Zielinski-IPA)
W81-01212

SURFACE WATER QUALITY IN YOHO NATIONAL PARK - AN INVENTORY.
Inland Waters Directorate, Ottawa (Ontario).
Technical Report WQB-80-1, January, 1980. 24 p, 1 Fig, 5 Tab, 14 Ref, 1 Append.

Descriptors: *Surface waters, *Water quality, *Canada, *National parks, Anions, Cations, Aquatic microorganisms, Aquatic life, Facilities, Recreation facilities, Natural resources, Recreation, Water analysis, Ions, Electrolytes, Properties, Trace metals, Heavy metals, Water pollution, Microorganisms, Chemical analysis, Evaluation, Nutrients, *Yoho National Park(British Columbia).

The results of a two-year baseline monitoring program carried out in Yoho National Park, located in the heart of the Canadian Rockies, are presented and summarized. The study, which covered the period from April 1976 to March 1978, showed that while the Park waters are generally of good quality, Park areas exist where surface water quality has been degraded by human activites. Nutrient levels in all surface waters examined were typically low and did not appear to be elevated by activities within the Park. In decreasing abundances, the major cations were calcium, magnesium, sodium, and potassium; while the major anions were bicarbonate, sulfate, silicates, chlorides, and fluorides. The abundance of these ions were similar to those found in most Rocky Mountain Parks. Copper, cadmium, mercury, arsenic, selenium, lead, and barium were generally below/near detection limits in all streams. Measurable manganese, iron, and boron levels present in most waters studied were highest during the high water period, suggesting significant concentrations of these in the suspended sediments. Most Park surface waters were found to be of natural bacteriological quality; however, several locations of high total coliforms were noted. (Zielinski-IPA)
W81-01213

A SIMPLE METHOD USING A DISPOSABLE SYRINGE TO PREPARE SAMPLES FOR DELTA 018 MEASUREMENTS IN WATER SAMPLES,
Centro de Energia Nuclear na Agricultura, Sao Paulo (Brazil).
E. Matsui.
Analytica Chimica Acta, Vol 120, p 423-425, November, 1980.

Descriptors: *Oxygen isotopes, *Isotope studies, Syringes, Water analysis, Analytical techniques.

Commerical 10 ml disposable polypropylene syringes may be used for isotopic equilibration in delta 018 determinations in water samples. The procedure involves adding concentrated H2SO4 without contaminating the upper internal surface of the syringe, placing the piston in the cylinder without touching the acid, and pulling the sample of water into the cylinder. After the sample is shaken, the water volume is adjusted to 3.0 ml, CO2 is inserted to 10 ml, and the syringes placed in a heated water bath overnight. One technician can prepare 50 samples in 2 hours. (Cassar-FRC)
W81-01241

DETERMINATION OF TRACE AMOUNTS OF ALKYLBENZENE-SULFONATES BY HIGH-PERFORMANCE LIQUID CHROMATOGRAPHY WITH FLUORIMETRIC DETECTION,
Kao Soap Co. Ltd. Tochigi (Japan).
A. Nakae, K. Tsuji, and M. Yamanaka.
Analytical Chemistry, Vol 52, No 14, p 2275-2277, December, 1980. 2 Fig, 4 Tab, 14 Ref.

Descriptors: *Alkylbenzene sulfonates, *Analytical techniques, Pollutant identification, Detergents, Gas chromatography, Water analysis.

Modifications in the high performance liquid chromatography method of determining trace amounts of alkylbenzene sulfonates in water produced improved analytical results. No preconcentration or derivatization was necessary. Use of 0.1 M sodium perchlorate in methanol/water (8:2) optimized operating conditions of the fluorimeter used to detect the components. Alkylbenzene sulfonates were well resolved according to alkyl chain lengths. Partial phenyl isomer compositions were also obtained. River water analysis by this modified method was reproducible within 2% relative standard deviation in the range of 0.097 micrograms per ml. (Cassar-FRC)
W81-01242

POLY(ACRYLAMIDOXIME) RESIN FOR DETERMINATION OF TRACE METALS IN NATURAL WATERS,
Massachusetts Univ., Amherst. Dept. of Chemistry.
M. B. Colella, S. Siggia, and R. M. Barnes.
Analytical Chemistry, Vol 52, No 14, p 2347-2350, December, 1980. 4 Tab, 30 Ref.

Descriptors: *Resins, *Analytical techniques, *Metals, Pollutant identification, Poly(acrylamidoxime), *Trace elements, Sea water, Ponds, Spectrometry.

Trace metal determinations in natural waters are important in pollutant identification and in cases of micronutrient depletion. Application of a poly(acrylamidoxime) resin to the determination of Fe(3+), Mn(2+), Cu(2+), Zn(2+), Co(2+), Ni(2+), Hg(2+), Pb(2+), Cd(2+), and Ag(1+) in sea water and pond water showed good agreement with values determined by differential pulse polarography or differential pulse anodic stripping voltammetry. Metals were removed from the resin by equilibrating with a 1:1 nitric acid/water mixture, a 1:1 HCl/water mixture, or a 1M thiosulfate solution. Concentrations of metals in the eluate were determined by atomic absorption spectrometry. This resin has several advantages over previously used materials. The alkali and alkaline earth metals in sea water do not interfere with analysis. Simple elution removes sequestered metals, allowing regeneration of the resin for subsequent analysis. (Cassar-FRC)
W81-01243

IDENTIFICATION OF CHLORINATED METHOXYBIPHENYLS AS CONTAMINANTS IN FISH AND AS POTENTIAL INTERFERENCES IN THE DETERMINATION OF CHLORINATED DIBENZO-P-DIOXINS,
Food and Drug Administration, Washington, DC. Div. of Chemical Technology.
D. W. Phillipson, and B. J. Puma.
Analytical Chemistry, Vol 52, No 14, p 2328-2332, December, 1980. 6 Fig, 1 Tab, 21 Ref.

Descriptors: *Polychlorinated biphenyls, *Pollutant identification, *Analytical techniques, Chlorinated hydrocarbon pesticides, Mass spectroscopy, Gas chromatography, Chemical analysis, Organic compounds, Dioxins, Fish.

Chlorinated methoxybiphenyls interfered with determination of polychlorinated dibenzo-p-dioxins in fish samples examined by gas-liquid chromatography/mass spectroscopy. Synthesized 3,3',4',5-tetrachloro-4-methoxy biphenyl and 2,3',4,4'-tetrachloro-3-methoxybiphenyl behaved similarly to the dioxins in cleanup procedures and in gas-liquid chromatography/mass spectroscopy properties. It is suggested that previous analytical results obtained on environmental samples be reexamined by selected ion monitoring exclusively for the isotopic molecular ions from dioxins. For reliable identification and quantification of polychlorinated dibenzodioxins, it might be necessary to examine the mass spectra to rule out the presence of polychlorinated methoxy biphenyls (by the absence of fragment ion clusters resulting from losses of CH3, CH3CO, and CH3CO + 2Cl from the M+ cluster). (Cassar-FRC)
W81-01245

MASS SPECTROMETRIC DETERMINATION OF DEUTERIUM IN WATER AT NATURAL LEVELS,
Australian Atomic Energy Commission Research Establishment, Lucas Heights.
P. E. Hartley.
Analytical Chemistry, Vol 52, No 13, p 2232-2234, November, 1980. 2 Fig, 2 Tab, 6 Ref.

Descriptors: *Mass spectromety, *Deuterium, *Water analysis, Isotope studies, Hydrologic data, Performance, Chemical analysis, Australia.

A new system for measuring the D/H ratio of natural water samples for hydrological investigations is described, and sample measurement data are provided. The system is based on an AEI MS20, a small 180 deg deflection machine. Improvements in furnace design and a memory correction technique have eliminated the necessity to introduce samples more than once except after large changes in D/H between samples. One hundred samples can be measured to an accuracy of 0.1% with 95% confidence in an 8-hour day. The system is being used in various hydrological investigations by the Australian Atmic Energy Commission Nuclear Hydrology Group. (Small-FRC)

PROFICIENCY TEST SAMPLE MEDIA FOR SINGLE AND MIXED PURE CULTURES OF WATER POLLUTION INDICATOR BACTERIA,
New York State Dept. of Health, Albany.
R. W. Toombs, and D. A. Connor.
Applied and Environmental Microbiology, Vol 40, No 5, p 883-887, Novermber, 1980.

Descriptors: *Water analysis, *Quality control, *Bioindicators, *Separation techniques, On-site tests, Analytical techniques, Pollutant identification, Coliforms, Cultures, Isolation, Enteric bacteria, Pseudomonas, Sampling, Storage, Potable water, Testing procedures, Water pollution.

Tests were conducted to find a suitable transport medium for culturing bacteria from water samples that would maintain Escherichia coli, Enterobacter cloacae and Pseudomonas aeruginosa in combination for 48 hours to provide a positive coliform count and a countable standard plate. Two media, designated NYSDH-1 and NYSDH-2, were formulated which required no special handling or reconstitution and maintained inoculated organisms with an 88% viability level for up to 48 hours. Sample preparation procedures and shipping and handling protocol were also devised for use with the new media. The stability of E. coli and P. aeruginosa in NYSDH-1 media and E. cloacae in NYSDH-2 media were investigated in pilot studies designed to simulate field conditions for analysis of potable water for coliforms by membrane filter and standard plate count and most probable number dilution tests. Actual field tests were conducted on a reference set of samples which was shipped to and analyzed by laboratories at the Environmental Protection Agency or in New York State. Statistical analyses of results showed that the media are satisfactory for use in laboratory quality control programs. (Geiger-FRC)

ORGANOCHLORINE COMPOUNDS IN AQUATIC ENVIRONMENTS,
Labor Inspection Directorate, Oslo (Norway).
J. E. Bjerk, and E. M. Brevik.
Archives of Environmental Contamination and Toxicology, Vol 9, No 6, p 743-750, 1980. 2 Tab, 10 Ref.

Descriptors: *Aquatic life, *Chlorinated hydrocarbon pesticides, Pentachlorobenzene, Octachlorostyrene, Hexachlorobenzene, Pesticide residues, Agricultural chemicals, Invertebrates, Fish, Polychlorinated biphenyls, Pollutants, Sediments, Path of pollutants, Absorption, *Norway, *Oslo Fjord area(Norway).

Body burdens of five organochlorine compounds were examined at two locations in the Oslo Fjord area of Norway in the following species: barnacles, bristle worm, brittle star, cod, common goby, crab, flounder, hermit crab, mussel, saithe, sea star, shrimp, and snail. Uniform levels of contamination were found for DDE, PCBs, and pentachlorobenzene, especially when data were compared on a fat weight basis. Hexachlorobenzene and octachlorostyrene were found at various levels of concentration in the different species. The ratio of PCB/DDE was constant at 10 among the invertebrates, and close to 15 for fish species. PCB levels ranged from 1.5 times the dry sediment level in mussel to 8.5 for flounder, giving an interspecific variation factor of 5.4. The corresponding factor for DDE was 4.6. Sedimentary contamination was minimal for HCB and DDE. The findings concerning DDE, PCBs and pentachlorobenzene suggest that direct uptake from water via respiratory organs occurs as a result of direct body contact with the contaminants, and makes this the major route of entry. Variable levels of HCB and octachlorostyrene are not explained by this theory. High residue levels in some species seem to result from feeding habits, even though it has been definitely demonstrated that accumulation through food chains occurs. (Baker-FRC)
W81-01250

SIMPLIFIED MONITORING PROCEDURE FOR BENZO(A)PYRENE, HEXACHLOROBENZENE AND PENTACHLOROPHENOL IN WATER,
Texas A and M Univ., College Station. Dept. of Chemistry.
C. S. Giam, D. A. Trujillo, S. Kira, and Y. Hrung.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 5, p 824-827, November, 1980. 2 Tab, 4 Ref.

Descriptors: *Analytical techniques, *Pollutant identification, *Organic chemicals, Water analysis, Chromatography, Insecticides, Fungicides, Herbicides, Pentachlorophenol, Hexachlorobenzene, Benzo(a)pyrene, Polycyclic hydrocarbons, Carcinogens, Agricultural chemicals.

Simplified methods of water analysis are reported which require only a 5.0 ml sample to measure concentrations of pollutants ranging from 0.2 to 220 ppb. The methods are useful for analysis of benzo(a)pyrene (BaP), hexachlorobenzene (HCB) and pentachlorophenol (PCP) as well as similar contaminants in water. For analysis of BaP, samples were twice extracted with petroleum ether and the extracts combined. Solvent was next evaporated with a slow stream of dry nitrogen filtered through a molecular sieve. The residue was dissolved in MeOH, and 50-100 upsilon l were analyzed by high pressure liquid chromatography (HPLC). BaP concentrations of 0.04 to 2.0 ppb were recovered with 80% or better accuracy. Samples containing HCB were extracted once with isooctane and the extract directly analyzed by gas chromatography with an electron capture detector. HCB concentrations of 0.5 ppb gave recoveries greater than 75%. Samples containing PCP were acidified with sulfuric acid and then extracted twice with petroleum ether/diethyl ether. Solvent was evaporated from the combined extracts by dry nitrogen as above. Residue was dissolved in acrylonitrile and analyzed by HPLC. PCP concentrations ranging from 80 to 200 ppb gave greater than 80% recoveries. (Baker-FRC)

FIELD AND LABORATORY METHODS FOR INVESTIGATING A MARINE GASOLINE SPILL,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
C. W. Dimock, J. L. Lake, C. B. Norwood, R. D. Bowen, and E. J. Hoffman.
Environmental Science and Technology, Vol 14, No 12, p 1472-1475, December, 1980. 2 Fig, 1 Tab, 20 Ref.

Descriptors: *Pollutant identification, *Gasoline, Chromatography, Mass spectrometry, Analytical techniques, Water pollution, Organic compounds.

A method for examining somewhat volatile hydrocarbon pollutants in water samples is described, which uses on-board liquid-liquid extraction followed by transfer of extracts to the laboratory and analysis by gas chromatography and gas chromatography-mass spectrometry. The method was used to measure gasoline compounds in seawater samples collected during the response to a spill situation. Samples were collected both of water and of bivalve mollusks near Block Island Sound, Rhode Island. The results of the analysis indicated that almost all of the gasoline compounds present in the water samples could be detected by this method. A portion of each of these individual compounds was, however, lost during sample handling and analysis. Recovery of gasoline compounds in spiked seawater samples was consistent and ranged from 50 to 70%. Gas chromatograms of extracts from most of the shellfish tissues showed some resemblance to those obtained from gasoline standards, but interfering peaks were also prominent. The analytical methodology used here could be successfully applied to a spill situation where no observable gasoline slick was present. If a slick were present the sampling bottle would probably be contaminated and the analysis biased. (Baker-FRC)

ISOLATION OF 01 SERVOVARS OF VIBRIO CHOLERAE FROM WATER BY SEROLOGICALLY SPECIFIC METHOD,
Louisiana State Univ., Baton Rouge. Dept. of Microbiology.
K. W. Hranitzky, A. D. Larson, D. W. Ragsdale, and R. J. Siebeling.
Science, Vol 210, No 4473, p 1025-1026, November, 1980. 1 Fig, 1 Tab, 10 Ref.

Descriptors: *Separation techniques, *Pathogenic bacteria, *Louisiana, Water pollution, Public health, Human diseases, Water pollution effects, Aquatic bacteria, Adsorption, Water analysis, Laboratory tests, Pollutant identification, Assays, Path of pollutants, Bayous, Cholera.

Eleven cases of cholera occurred among Louisiana residents in 1978 and were traced to contaminated food containing the Vibrio cholerae bacteria of the serological variety 01. Cholera is generally transmitted by food, water or fomites polluted with human feces containing the bacteria. It became important to discern whether the 01 serovar responsible for the Louisiana cholera cases was imported from an endemic area by an infected person, or whether the bacterium was present in Louisiana as part of the normal aquatic flora. A method which combines the principles of serologically specific electron microscopy and enzyme-linked immunosorbent assay was used to isolate 01 serovars of V. cholerae from environmental water samples. The water was mixed with Tween 20 and passed through packed columns of polystyrene beads. The beads, which were coated with antibodies against the 01 antigenic determinants, were then washed with buffer and Tween 20, transferred to alkaline peptone broth, and incubated. Growth on the broth was transferred to selective medium on petri plates, and V. cholerae colonies were isolated and identified by routine microbiological procedures. Water samples taken from a south central Louisiana bayou showed the presence of 01 serovars of V. cholerae by this isolation technique. The method is also recommended for isolating Salmonella, Shigella and Legionella from water or other potentially pathological specimens. (Geiger-FRC)

A NOTE ON THE SENSITIVITY OF CHLORINE-STRESSED BIFIDOBACTERIA TO NALIDIXIC ACID,
Department of Water Affairs, Pretoria (South Africa). Hydrological Research Inst.
D. P. Sartory.
Journal of Applied Bacteriology, Vol 49, No 2, p 291-293, October, 1980. 1 Tab, 8 Ref.

Descriptors: *Bacteria, *Sewage effluents, Bifidobacteria, Nalidixic acid, Chlorine, Pollutant identification, Bioindicators, *Chlorination, Evaluation.

Bifidobacterium adolescentis, an indicator of fecal pollution, was proved sensitive to 10 micrograms per ml nalidixic acid after exposure to chlorinated sewage effluent containing 0.08 mg per 1,000 ml residual chlorine. Effluent containing 0.7 mg per 1,000 ml chlorine caused sensitivity at the level of 5 micrograms per ml of nalidixic acid. Normally, B. adolescentis is resistant to 200 micrograms per ml nalidixic acid. It was concluded that the Evison-Morgan medium (5 micrograms nalidixic acid per ml) would give a valid bacteria count from effluent containing less than 0.1 mg per 1,000 ml residual chlorine. The Resnick-Levin YN-6 media (80 micrograms nalidixic acid per ml) may give zero or a very low count of bacteria in chlorinated effluent. (Cassar-FRC)

IDENTIFICATION OF HAZARDOUS ORGANIC CHEMICALS IN FISH FROM THE ASHTABULA RIVER, OHIO, AND WABASH RIVER, INDIANA,
Environmental Research Lab., Duluth, MN.
D. W. Kuehl, E. N. Leonard, K. J. Welch, and G. D. Veith.
Journal of the Association of Official Analytical Chemists, Vol 63, No 6, p 1238-1244, 1980. 3 Fig, 3 Tab, 10 Ref.

Descriptors: *Pesticide residues, *Fish, *Pollutants, Water pollution, *Pollutant identification, Ashtabula River(OH), Wabash River(IN), DDT, Polychlorinated biphenyls, Endrin, Heptachlor, Arochlors, Organic compounds.

Composite fish samples from the Wabash River, Indiana, and the Ashtabula River, Ohio, were analyzed for pesticide residues by gas chromatography/mass spectroscopy using both electron impact and negative chemical ionization modes. The Wabash River fish sample contained 310 ppb DDT, 3210 ppb total polychlorinated biphenyls, 30 ppb hexachlorobenzene, 8.54 ppb trans-chlordane, 12.98 ppb cis-chlordane, 20.04 ppb trans-nonachlor, 4.89 ppb cis-nonachlor, and less than 0.50 ppb heptachlor, heptachlor epoxide, oxychlordane, and octachlorostyrene. Endrin, some of its manufacturing intermediates, and some metabolites were also found. Pentachlorophenol, a wood preservative, and pentachlorobenzyl alcohol were present. The Ashtabula River sample contained 130 ppb DDT, 7200 ppb PCB's, 3140 ppb hexachlorobenzene (the second highest level observed in previous work), 500 ppb octachlorostyrene, and less than 0.50 ppb of the chlordanes, nonachlors, and heptachlors. This sample also contained a number of polychlorinated hydrocarbons with 2-6 carbons. (Cassar-FRC)

GAS CHROMATOGRAPHIC DETERMINATION OF FLURIDONE AQUATIC HERBICIDE AND ITS MAJOR METABOLITE IN FISH,
Lilly Research Labs., Greenfield, IN. Agricultural Analytical Chemistry.
S. D. West, and R. O. Burger.
Journal of the Association of Official Analytical Chemists, Vol 63, No 6, p 1304-1309, November, 1980. 2 Fig, 1 Tab, 8 Ref.

Descriptors: *Pesticide residues, *Pollutant identification, *Fluridone, Herbicides, Gas chromatography, Analytical techniques, Fish.

The herbicide, fluridone (1-methyl-3-phenyl-5-(3-(trifluoro-methyl)phenyl)-4(1H)-pyridinone) and its major metabolite (1-methyl-3-(4-hydroxyphenyl)-5-(3-(trifluoromethyl)phenyl)-4(1H)-pyridinone) were determined in fish. The lower detection limit was 0.01 ppm, and recoveries averaged 84 + or - 14.7% for fluridone and 83 + or - 13.4% for the metabolite. Finely ground fish tissue was extracted with methanol, and the extract hydrolyzed with HCl to release the conjugated residues. After liquid-liquid partition purification with hexane and ethyl acetate, the sample was reacted with methyl iodide and brominated with phosphorus tribromide. Following Florisil column separation, the derivatives were quantified by electron capture gas liquid chromatography. (Cassar-FRC)
W81-01293

THE CHROMATOGRAPHIC AND GC/MS ANALYSIS OF ORGANIC PRIORITY POLLUTANTS IN WATER,
Finnigan Inst., Cincinnati, OH.
Q. V. Thomas, J. R. Stork, and S. L. Lammert.
Journal of Chromatographic Science, Vol 18, No 11, p 583-593, November, 1980. 5 Fig, 4 Tab, 6 Ref.

Descriptors: *Pollutant identification, *Gas chromatography, *Organic compounds, Water pollution, Analytical techniques, Legal aspects, Mass spectrometry, Separation techniques, Waste water, Sampling, Storage, Water analysis, Quality control, Data processing, Reviews, Water quality.

Of the US EPA's list of pollutants to be controlled under a 'Consent Decree' court ruling, 129 compounds and metals were designated as priority pollutants, based on their frequency of occurrence in point source industrial samplings. Methodology for the GC/MS analysis and chromatographic analysis for 114 of these priority pollutants in wastewater is reviewed, and sections on sampling, storage, equipment, sample preparation, and quality control are also included. Under the 'Best Available Technology' section of the Consent Decree a liquid-liquid concentration technique followed by GC/MS is recommended for TCDD (dioxin). Gas chromatographic methods using purge-and-trap concentration are applied to purgeable halocarbons and aromatics, plus acrolein and acrylonitrile. Phenols, phthalate esters, nitrosamines, pesticides, PCBs, nitroaromatics, polynuclear aromatic hydrocarbons (PAH), and haloethers are best analyzed by gas chromatography methods using liquid/liquid extraction. Liquid chromatography with liquid/liquid extraction is utilized for benzidine and its derivatives and PAHs. GC/MS methodology is also used in conjunction with liquid/liquid extraction at very acidic or basic pH levels for a number of phenolic compounds and pesticides and with purge trap concentration techniques for many of the purgeable organics. The legal aspects of the proposed analysis methods for the priority pollutants in relation to the National Pollutant Discharge Elimination System permits are also mentioned. (Geiger-FRC)

ISOLATION AND ENUMERATION OF FAECAL STREPTOCOCCI FROM NILE WATER (1975-1976),
Ministry of Agriculture and Water, Riyadh (Saudi Arabia).
F. A. Saleh.
Water Research, Vol 14, No 12, p 1669-1678, December, 1980. 6 Fig, 5 Tab, 38 Ref.

Descriptors: *Streptococcus, *Nile river, *Bioindicators, Separation techniques, Coliforms, Water pollution, Water pollution sources, Water analysis, Water quality, Farm wastes, Isolation, Rivers, Dams, Impoundments.

The value of the fecal streptococcus group as an indicator of water pollution was examined in 94 Nile River water samples taken from 3 segments of the river over a period of 16 months. Recovery of streptococci was performed by a modified thallous-azide technique and the standard M-enterococcus medium with a membrane filter method. Most probable number for fecal streptococcus was recorded with the aid of azide dextrose and ethyl violet azide (AD-EVA). The sources of fecal streptococci isolates were traced by four differential tests. The highest fecal streptococci readings of 100-1000/ml were recorded from water samples of the Cairo segment. Upon biochemical examination, about 78% of the strains recovered were assigned to atypical or unclassifiable categories. The remaining 22% were classified as S. faecalis and two of its variants, S. zymogenes and S. liquefaciens. All water samples tested were positive for the presence of streptococci. Results of TTC reduction and tellurite resistance tests suggested that the streptococci recovered were mostly of animal fecal origin. (Geiger-FRC)
W81-01340

CONTINUOUS MONITORING FOR SEWAGE-TREATMENT PURPOSES,
Severn-Trent Water Authority, Birmingham (England). Tame Div.
A. E. Hey.
Water Pollution Control, Vol 79, No 4, p 477-484, November, 1980.

Descriptors: *Monitoring, Analytical techniques, *Sewage treatment, *Activated sludge, Data transmission, Waste water treatment, Computers, Instrumentation, Suspended solids, Hydrogen ion concentration, Ammonia.

The continuous monitoring system for both biological filter and activated sludge plant effluents at the Minworth sewage treatment works is described. The station, located 60 meters from the activated sludge effluent discharge channel, contains a pumping system for automatic sampling, a system for distributing the samples to monitors, and a programmable electronic sequence timer for controlling sampling and valve-changing sequences. The monitoring system determines suspended solids by optical measurements, ammonia by gas sensing selective ion electrode, pH by electrode, and temperature by platinum resistance thermometer. Raw data is transmitted and updated at the receiving station every 2 minutes. Development work on extending the monitoring process to additional phases of the sewage treatment process is planned. (Cassar-FRC)

ISOLATION AND CHARACTERIZATION OF POLYMERIC ORGANIC MATERIALS IN A POLLUTED RIVER WATER,
Tokyo Metropolitan Univ. (Japan). Dept. of Chemistry.
R. Ishiwatari, H. Hamana, and T. Machihara.
Water Research, Vol 14, No 9, p 1257-1262, September, 1980. 4 Fig, 5 Tab, 9 Ref.

Descriptors: *Water pollution, *Rivers, Analytical techniques, Polymers, Resins, Organic compounds, Mass spectrometry, Oxidation, Separation techniques, Gas chromatography, Water analysis, *Tamagawa River(Japan), Japan, Water analysis, *Separation techniques, *Organic matter.

Amberlite XAD-2 resin was used to isolate organic matter from water samples taken from the Tamagawa River in Japan. With this technique, 40% of the total dissolved organic matter was isolated. The elemental compositions of the isolated organic materials from various locations were similar, amounting to carbon 41-48%, hydrogen 5.8-7.0% and nitrogen 4.7-6.7%. Other tests performed on the isolated material included molecular weight distribution, u.v. and i.r. spectra, and GC/MS analysis of alkaline potassium permanganate oxidation products. More than 50% of the isolated organic matter had molecular weights higher than 5000. Alkaline permanganate oxidation of the isolated organic materials produced aliphatic monocarboxylic acids, dicarboxylic acids and benzene-mono, di tri and tetracarboxylic acids. The relative amounts of these three groups can apparently be explained in terms of the nature and degree of pollution. (McKeon-FRC)

COLIPHAGES AS INDICATORS IN A TREATMENT PLANT,
Istituto Superiore di Sanita, Rome (Italy).
G. Ignazzitto, L. Volterra, F. A. Aulicino, and A. M. D'Angelo.
Water, Air, and Soil Pollution, Vol 13, No 4, p 391-398, December, 1980. 13 Tab, 6 Ref.

Descriptors: *Waste water treatment, *Bioindicators, *Coliforms, E. coli, Pollutant identification, Water pollution, Activated sludge, Analytical techniques.

Use of coliphages as indicators of water pollution was investigated in raw sewage influent, primary sedimentation tank effluent, and activated sludge effluent. Although fecal coliforms and coliphages showed a general reduction through the treatment process, the two populations were not always closely related. Water samples stored for 2 weeks showed a decay in plaque forming units. Several strains of E. coli were tested. Phage No. 8113 appeared to be the best marker. (Cassar-FRC)

DETERMINATION OF METALS IN SEWAGE EFFLUENTS,
T. B. Webster.
Water Pollution Control, Vol 79, No 4, p 511-514, November, 1980. 3 Tab, 27 Ref.

Descriptors: *Analytical techniques, *Sewage effluents, *Metals, *Pollutant identification, Spectrophotometry, Zinc, Copper, Iron, Lead, Nickel, Cadmium, Trace elements.

An improved method for analyzing metals at the microgram per liter level in sewage effluents is described. The sample undergoes nitric acid digestion to remove emulsion-producing substances. After neutralization and chelation, the sample is extracted with methyl isobutyl ketone. Analyses for zinc, copper, iron, lead, nickel, and cadmium are carried out using a Pye-Unicam SP90 Series 2 atomic absorption spectrophotometer coupled with a 10mV recorder. Reagent blanks should be run at

the same time and corrections made to compensate for trace metals in the nitric acid and other reagents. By increasing the sample to solvent ratio, lower limits of detection are possible. (Cassar-FRC)

BACTERIOLOGICAL MONITORING OF POLLUTION IN SHELLFISH: METHODOLOGICAL EVALUATION,
Instituto Superiore di Sanita, Rome (Italy). Lab. di Igiene del Territorio.
L. Volterra, F. A. Aulicino, E. Tosti, and M. Zicarelli.
Water, Air, and Soil Pollution, Vol 13, No 4, p 399-410, December, 1980. 1 Fig, 6 Tab, 9 Ref.

Descriptors: *Pollutant identification, *Coliforms, *Shellfish, Analytical techniques, Water pollution, Bacteria, Mussels, Gulf of Pozzuoli, *Naples(Italy), *Italy.

Three different methods of determining fecal pollution in shellfish were compared. The first method, proposed by the Italian Government, uses flesh and intervalve water obtained from groups of 10 shellfish each, diluted with saline solution, to analyze for total and fecal coliforms by the most probable number technique. Method 2, proposed by the British Ministry of Agriculture, Fisheries, and Food, uses the flesh only of 20 shellfish diluted with 0.1% peptone water to analyze for bacteria by the pour plate method. The third method, WHO/UNEP, uses 25 grams of shellfish flesh without intervalve water, diluted with 1% peptone water and analyzed by the most probable number technique. Inclusion of intervalve water in the sample introduces a variability factor, decreasing or increasing the bacterial counts depending on quality of the growing water. In general, the most probable number of techniques give higher values than the pour plate (direct count) method. Sample size does not affect results. Simultaneous analyses on flesh, intervalve water, and growing water show great variations in bacterial contamination. (Cassar-FRC)

OPPORTUNITIES FOR U.S. FISH AND WILDLIFE SERVICE INITIATIVES RELATED TO URANIUM MINING AND MILLING IN THE WESTERN UNITED STATES,
Enviro Control, Inc., Fort Collins, CO.
G. C. Horak, and J. E. Olson.
In: Proceedings of the Uranium Mining and Milling Workshop, May 28-29, 1980, Fort Collins, Colorado, Fish and Wildlife Service Report FWS/OBS-80/57, August, 1980, p 14-61. 2 Fig, 12 Tab, 60 Ref.

Descriptors: *Uranium mining, *Wildlife, *Mine wastes, *Radioactive wastes, Wildlife habitats, Water pollution, Mills, Mineral industry, *Environmental effects, Trace elements, Radioactive waste disposal, Air pollution.

In the western United States, uranium mining and milling have disturbed 14,900 hectares. Because annual uranium production is predicted to increase nearly seven-fold by the year 2000, mining and milling are expected to impact an additional 57,200 hectares. Exploration will temporarily impact an additional 724,500 hectares. Potential impacts of conventional uranium mining include habitat destruction, air pollution, water pollution, radiation exposure, and trace element toxicity. Unconventional mining may cause less surface disturbance, and the site may be easier to reclaim. The principle impact to fish and wildlife resulting from milling activities, exclusive of tailings disposal, is surface habitat destruction. Mill tailings ponds and piles represent a source of direct injury or contamination of wildlife, radon emanations, pond seepage, and spills of tailings through dike breaches. Mill decommissioning and mine reclamation may not have a major impact on fish and wildlife, but inactive tailing sites present a hazard until they are decontaminated. The Fish and Wildlife Service is now involved in the early planning of uranium projects, standards settings, and research and development program planning to reduce the impacts of uranium mining and milling. (Moore-SRC)
W81-01216

SANDIA'S ACTIVITIES IN URANIUM MILL TAILINGS REMEDIAL ACTION,
Sandia National Labs., Albuquerque, NM.
S. Neuhauser.
In: Proceedings of the Uranium Mining and Milling Workshop, May 28-29, 1980, Fort Collins, Colorado, Fish and Wildlife Service Report FWS/OBS-80/57, August, 1980, p 68-73. 1 Tab, 1 Ref.

Descriptors: *Uranium mill tailings, *Radioactive waste disposal, *Environmental effects, Wildlife habitats, Soil contamination, Water pollution, Hydrology, Land use, *Pollution abatement.

The Uranium Mill Tailings Radiation Control Act of 1978 requires that remedial action be taken at over 20 inactive uranium mill tailings sites. The proposed standards promulgated under this Act by the Environmental Protection Agency require cleanup of soil and contaminated structures at existing locations. In several cases the present sites are felt to be too close to human habitations or to be otherwise unacceptably located, and these tailings will probably be relocated. The candidate alternative sites must satisfy certain geophysical, hydrological, and meteorological criteria. Environmental impact studies at these sites must consider not only the direct impacts of relocation efforts at present and proposed sites, but also land-use policies, socio-economic factors, the impacts of borrow pit and roadway construction, and other factors. A vital part of these studies, of course, is consideration of potential effects on fish and wildlife and mitigating actions to restore or improve unavoidably affected habitats. The possibility of contamination of wildlife at tailings sites both before and after stabilization requires further study. (Moore-SRC)
W81-01217

EPA ACTIVITIES FOR THE CONTROL OF URANIUM MINING AND MILLING EFFLUENTS,
Environmental Protection Agency, Denver, CO.
P. Wagner.
In: Proceedings of the Uranium Mining and Milling Workshop, May 28-29, 1980, Fort Collins, Colorado, Fish and Wildlife Service Report FWS/OBS-80/57, August, 1980, p 77-87. 1 Fig, 2 Tab.

Descriptors: *Uranium mining, *Radioactive wastes, *Water pollution sources, Radioactive waste disposal, Wildlife, Soil contamination, Environmental effects, Mine wastes, Mills, Groundwater, Regulation, Inter-agency cooperation, Pollution abatement.

Uranium mining and milling operations can result in the contamination of the environment with technologically enhanced natural radioactivity. The primary pathways by which radioactivity reaches a dose receptor are: direct external gamma exposure from airborne or groundwater deposited radionuclides; inhalation of radioactive materials; ingestion of radionuclides through contaminated foodstuffs; and ingestion of contaminated water. Congress has provided the Environmental Protection Agency (EPA), Nuclear Regulatory Commission (NRC), and Department of Energy (DOE) with a patchwork of Acts directed at specific processes associated with uranium mining and milling. In many cases, EPA has been ordered to set standards in consultation with NRC and DOE, and the latter two agencies are to implement them. Existing, proposed, or planned regulations will protect the environment from all effluents except groundwater contamination from milling activities. In addition to developing regulations for the uranium fuel cycle, EPA aids NRC Agreement states in their review of impact reports submitted by applicants for milling licenses. NRC solicits EPA review of environmental impact statements that NRC develops for milling projects under its jurisdiction. Future cooperation with the Fish and Wildlife Service may aid EPA efforts to control mining and milling effluents. (Moore-SRC)
W81-01218

DETERMINATION OF ATMOSPHERIC PHOSPHORUS ADDITION TO LAKE MICHIGAN,
Wisconsin Univ.-Milwaukee. Center for Great Lakes Studies.
S. J. Eisenreich, P. J. Emmling, and A. M. Beeton.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-219124, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/3-80-063, July, 1980. 60 p, 11 Fig, 10 Tab, 36 Ref, 1 Append. R 803238.

Descriptors: *Lake Michigan, *Phosphorus, Chemistry of precipitation, *Water pollution sources, Great Lakes, Eutrophication, Nutrients, Precipitation(Atmospheric), Air pollution, Seasonal, Aeolian soils, Path of pollutants, Air entrainment, Lake basins.

Lake Michigan has a large surface area, but a small drainage basin suggesting that the atmosphere may be a significant source of natural and anthropogenic components representing a sizeable portion of the total nutrient budget. Bulk precipitation was collected on a monthly basis in the Lake Michigan basin for 18 months during 1975-1976 to determine atmospheric phosphorus loadings to Lake Michigan. The sampling network consisted of bulk collectors at 23 land stations and 2 in-lake buoys located off urban and rural areas. Annual phosphorus loading to Lake Michigan from atmospheric sources was 1,690,000 kg in 1976, which represents 15.7% of the total budget based on 1975 data. In 1976, atmospheric deposition of phosphorus in Lake Michigan was dominated by a dry fall component likely derived from wind-blown soil. Actual in-lake loading of phosphorus may exceed loading calculated from land-based stations by up to 50%. The phosphorus weighted average concentration in bulk precipitation was 0.050 and 0.064 mg/l in the north and south basins, respectively, as compared to the average lake water concentration of 0.01 mg/l. Seasonal variations in loading rates showed maxima in late spring and early summer, and minima in winter. Wet-only precipitation concentrations for phosphorus averaged 15% of bulk deposition values, and the pH averaged one unit lower than bulk deposition. (Moore-SRC)

ACCUMULATION OF COPPER IN FLUVIAL SEDIMENTS AND YELLOW WATER LILLIES (NUPHAR LUTEA) AT VARYING DISTANCES FROM A METAL PROCESSING PLANT,
Turku Univ. (Finland). Dept. of Biology.
K. Aulio.
Bulletin of Environmental Contamination and Toxicology, Vol 25, No 5, p 713-717, November, 1980. 1 Fig, 1 Tab, 13 Ref.

Descriptors: *Copper, *Plant tissues, *Fluvial sediments, Sediments, Metals, Deposition, Plant physiology, Sediment load, Industrial wastes, Heavy metals, *Finland, *River Kokemaenjoki(Finland)

The accumulation of copper in fluvial sediments and in dominant aquatic vegetation in the vicinity of a point source of heavy metal pollution was investigated. Samples of sediment were collected from the River Kokemaenjoki in western Finland. The site under study is located near a base metal purification and processing plant in Pori, which

produces an annual amount of 40-50,000 tons of copper with a discharge of 24 kg/d of copper into the river. The levels of copper in the sediments near the plant indicate an enrichment of discharged metals. The highest concentration of total copper was 1020 ppm. Accumulation of metal took place only in a narrow shallow water zone 0-8 m from shoreline. Levels of copper in deep water sediments were from 17 to 54 ppm. Most of the copper load is carried downstream and enters the Baltic Sea. The copper accumulated in various plant organs of the Nuphar lutea showed increased levels when compared to plants away from the site. Highest recorded concentrations for leaves and petioles were 98 and 115 ppm, respectively. Concentrations in below-ground organs of the plant were low, indicating selectivity in uptake/exclusion and translocation in the plant. The condition of the plants indicated extreme tolerance to heavy metal contamination. (Baker-FRC)

DISTRIBUTION OF POLYCHLORINATED BIPHENYLS IN THE FORT EDWARD, NEW YORK, WATER SYSTEM,
Rensselaer Polytechnic Inst., Troy, NY.
M. Brinkman, K. Fogelman, J. Hoeflein, T. Lindh, and M. Pastel.
Environmental Management, Vol 4, No 6, p 511-520, November, 1980. 3 Fig, 4 Tab, 25 Ref.

Descriptors: *Polychlorinated biphenyls, *Water pollution sources, *Chemical wastes, Water quality, Fort Edward(NY), Aquatic life, Soil, Sediments, Reservoirs, Impoundments, Potable water, Industrial wastes, Pollutant identification, Organic compounds.

Concentrations of polychlorinated biphenyls (PCBs) were determined in water, soils, sediment, and aquatic life of the Fort Edward, New York, water system, an area less than 0.5 km from a PCB disposal site. Types of PCB identified in samples were Arochlor 1016 and 1254. Water from reservoirs and the distribution system had significant and uniform PCB levels (median 100 nanograms per liter). Seven samples of groundwater and streams feeding the reservoirs showed no detectable PCB. The Hudson River at Fort Edward contained 530 ng per liter 5 times the reservoir level. A 30-day composite rainfall sample showed high levels of Arochlor 1016 (1,300 ng per liter), suggesting that this may be the principal source of PCB contamination in the reservoir system. One of the 13 samples of reservoir sediment contained 190 ng per g; the remaining 12, 40 ng per g or less. Similarly, the 5 soil samples showed wide variation. One level was high, 160 ng per g; and the others, 30 ng per g or less. PCB was more concentrated in the biota than in water or sediment. Twenty of 32 samples of algae and animal life contained detectable PCB, with a prefernce for the more highly chlorinated form. The macroinvertebrates, sediment dwellers, showed high levels of 580 ng per g. Estimates of total PCB level in the drinking water were 104 ng per liter, less than the 160 ng per liter limit used by the New York State Health Department. Efforts to reduce this low level of PCB are best directed toward reducing input from the sources. (Cassar-FRC)

TRANSPORT OF TRACE ELEMENTS IN ECOSYSTEMS OF THE BARHALDE WATERSHED IN THE SOUTHERN BLACK FOREST,
Institut fuer Bodenkunde und Waldernahrungslehre, Freiburg im Breisgau (Germany, F.R.).
K. Stahr, H. W. Zottl, and FR. Hadrich.
Soil Science, Vol 130, No 4, p 217-224, October, 1980. 6 Fig, 3 Tab, 15 Ref.

Descriptors: *Trace elements, *Chemistry of precipitation, *Metals, Beryllium, Copper, Water analysis, Soil chemical properties, Rainfall, Runoff, Lead, Cadmium, Germany, *Black Forest(Federal Republic of Germany), Heavy metals, *Path of pollutants.

Concentrations of trace elements and macroelements in rainfall, canopy drip, runoff, and soil solution were determined in a very cool, humid section of the Balck Forest. Samples were collected at four free-drained and three hydromorphic sites, and the concentrations of 20 elements and the pH of the samples were determined. Beryllium had the lowest input and the highest output. It was primarily mobilized in the mineral topsoil, and only a small amount was reabsorbed by humic acids or top soil or taken up by plants. None was leached by leaves. Lead concentrations were highest in precipitation, but only about 5% of the input appeared in the output. Cadmium, copper, and lead were all absorbed by the humus and iron oxide accumulation horizons of podzols and Ockererde. Copper was absorbed in all soils except podzols, and cadmium was not absorbed in mineral soil. Recent increases in atmospheric output of these trace minerals probably resulted in the enrichment and rise of turnover. (Small-FRC)
W81-01278

ISOLATION AND CHARACTERIZATION OF BACTERIA FROM THE BALTIC SEA,
Swedish Water and Air Pollution Research Lab., Stockholm.
A. H. Neilson.
Journal of Applied Bacteriology, Vol 49, No 2, p 199-213, October, 1980. 2 Fig, 5 Tab, 70 Ref.

Descriptors: *Bacteria, *Baltic Sea, *Salt tolerance, Alteromonas putrefaciens, Pseudomonas, Aerobic bacteria, E. coli, Water pollution, Pollutants.

Samples of water and sediment from 3 localities in the Baltic Sea (a control site and two sites subjected to industrial discharge) were examined to determine bacterial populations. The areas subject to pollution showed the highest numbers of bacteria, which included Enterobacteriaceae, Pseudomonas, Aeromonas hydrophila, Alteromonas putrefaciens, and Gram positive bacteria. None of the isolates had an absolute requirement for NaCl. The majority of isolates were salt tolerant, though of fresh water origin, and able to grow aerobically at salinities comparable to sea water. However, the Enterobacteriaceae were not able to grow anaerobically under comparable conditions. Samples of E. coli, Klebsiella pneumoniae and Yersinia enterocolitica survived for three weeks at 17C in sea water lacking carbon and nitrogen nutrients. Therefore, the persistence of pathogens in saline water should be re-evaluated. (Cassar-FRC)

Descriptors: *Mathematical models, *Oil pollution, *Estuaries, Rivers, Water pollution, Model studies, Path of pollutants, Sediments, Oxygenation, Water quality control, Tides, Sedimentation, Oil spills.

A new mathematical model was devised to simulate the distribution of residues from oil pollution along the length of a closed estuary. The proposed model is comprised of a dual system of continuously stirred tank reactors. Oil pollution residues which start out in suspension in the aqueous phase are transferred by settling to the sediments of the tanks. The settling rate of the residues constitutes an important parameter of the model, which can be evaluated by minimizing a least squares error objective function between the simulated and observed distribution of oil pollution residues along the system. A CYBER computer and an effective numerical technique were employed to solve the system of equations. Oil pollution residues were evaluated in the Parramatta and Duck Rivers of Australia using this model. Results showed that these rivers, conservatively estimated, contain 8,000 tons of oily residues. It was estimated that clean up of this particular pollution problem would take several decades. The new sediment model systems will be able to cover single and multipoint pollution sources and are recommended for use in the water quality management of closed estuaries. (Geiger-FRC)

WAIKATO RIVER POLLUTANT FLUSHING RATES,
Hamilton Science Center (New Zealand).
J. C. Rutherford, M. E. U. Taylor, and J. D. Davies.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 106, No EE6, p 1131-1150, December, 1980. 10 Fig, 5 Tab, 13 Ref.

Descriptors: *Dyes, *Dispersion, *Environmental engineering, *Rivers, Dye concentrations, Potable water, Mathematical models, Tracers, Water supply, Pollution, Water quality, Advection, Longitudinal dispersion, Similarities, Waikato River, New Zealand, On-site investigations, *Path of pollutants.

A dye dispersion experiment was conducted in the Waikato River in New Zealand in order to appraise methods of protecting the supply of potable water. Results showed persistent lateral inhomogeneity of concentration even well below the advective zone. The Fickian model of longitudinal dispersion described the dye profiles near the peak, but predicted pollutant arrivals and departures prematurely. Tracer data exhibited characteristics of a self-similar process in which average concentrations at any point can be calculated from peak concentration, arrival time, and duration of concentrations above half the peak, using a single scaling curve. A hybrid technique was developed for routing pollutant slugs along a nonuniform channel. It makes use of the Fickian model, and it reconstructs the entire concentration profile with greater accuracy. BLOOM-FORMING CYANOBACTERIUM MICROCYSTIS AERUGINOSA OVERWINTERS ON SEDIMENT SURFACE,
Dundee Univ. (Scotland). Dept. of Biological Sciences.
T. Preston, W. D. P. Stewart, and C. S. Reynolds.
Nature, Vol 288, No 5789, p 365-367, November 27, 1980. 2 Fig, 14 Ref.

Descriptors: *Path of pollutants, *Algae, *Water pollution sources, Cyanophyta, Microcystis aeruginosa, Odor-producing algae, Sediments, Epilimnion, Stratification, Water quality, Reservoirs, Lakes.

Experiments with N15 tracer incorporated into NaNO3 fertilizer showed that Microcystis aeruginosa, a bloom-forming blue-green alga, overwintered on the sediment surface in an experimental pond and provided an inoculum of colonies from which the following year's epilimnetic population developed. After addition of the labelled fertilizer to the water in August, 1976, an extensive Microcystis aeruginosa bloom developed in the epilimnion. In October the colonies migrated to the sediment surface, forming a clearly visible layer 1.0 cm thick. N15 was removed from the water by flushing in February, 1977. Particulate N15 in the water increased to a maximum in May, then declined in June with the onset of thermal stratification. In July and August the N15 concentration and Microcystis population were present in the surface waters. In late September M. aeruginosa and N15 particulates sedimented. (Cassar-FRC)

USE OF SELECTED FRESHWATER BIVALVES FOR MONITORING ORGANOCHLORINE PESTICIDE RESIDUES IN MAJOR MISSISSIPPI STREAM SYSTEMS, 1972-73,

Bureau of Marine Resources, Long Beach, MS.
R. L. Leard, B. J. Grantham, and G. F. Pessoney.
Pesticides Monitoring Journal, Vol 14, No 2, p 47-52, September, 1980. 1 Fig, 2 Tab, 8 Ref.

Descriptors: *Pesticide residues, *Water pollution sources, *Clams, Mississippi, DDE, DDT, Toxaphene, Methyl parathion, Chlordane, Halogenated pesticides, Agricultural runoff, Aquatic animals, Bioindicators.

Seven species of freshwater clams, collected in 13 streams representing 5 river basins throughout Mississippi, were analyzed for pesticide content. Highest levels of toxaphene and DDT were found in the streams located in agricultural regions. DDT and its metabolites showed a large reduction between 1972 and 1973, corresponding with decreased usage of DDT and with large-scale flooding in the state. Although no pesticide residues were found in 1972 water samples, toxaphene and methyl parathion were detected in water samples from some sites in 1973, reflecting an increase in use of these chemicals. However, toxaphene in clam samples decreased between 1972 and 1973. Chlordane was found in only 2 samples in 1972. Clams were shown to be effective monitors of pesticide content. C. manilensis was proved the best indicator of change, having higher and lower levels than the other species. Pesticide levels in water samples did not reflect concentrations in biota. (Cassar-FRC)

PESTICIDES IN GROUND WATER BENEATH IRRIGATED FARMLAND IN NEBRASKA, AUGUST 1978,
Nebraska Univ., Lincoln. Conservation and Survey Div.
R. F. Spalding, G. A. Junk, and J. J. Richard.
Pesticides Monitoring Journal, Vol 14, No 2, p 70-73, September, 1980. 1 Fig, 1 Tab, 17 Ref.

Descriptors: *Pesticide residues, *Water pollution, Pollutant identification, Potable water, Atrazine, Alachlor, Irrigation water, Herbicides, Nebraska, Nitrates, Chlorinated hydrocarbon, Pesticides.

Samples of water from 14 irrigation wells in the Central Platte region of Nebraska were analyzed for residues of 13 pesticides and nitrate-nitrogen. Atrazine, the most commonly used herbicide in this area, was found in all samples. Levels ranged from 0.06 to 3.12 micrograms per liter. Nitrate-nitrogen concentrations, which ranged from 17.1 to 34.3 mg per liter, correlated with atrazine levels with a coefficient of r = 0.55. Alachlor levels above 0.01 micrograms per liter appeared in 2 samples. It is believed that both atrazine and alachlor migrated vertically to the ground water. Levels of 2,4-D, EPTC, silvex, simazine, lindane, dieldrin, heptachlor, heptachlor epoxide, endrin, and methoxychlor were below detectable limits. DDT and DDE levels were less than 0.01 micrograms per liter. Although all reported levels were below limits for drinking water standards, the atrazine-nitrate combination is capable of forming nitrosamines. (Cassar-FRC)

NOTE ON HEAVY METAL CONCENTRATION IN THE AQUATIC ENVIRONMENT OF THE KITAKYUSHU DISTRICT IN JAPAN, 1976-1977,
Kitakyushu Municipal Inst. of Environmental Health Sciences (Japan).
H. Sakino, A. Hashimoto, Y. Uchimura, S. Tateishi, and T. Akiyama.
Water Research, Vol 14, No 9, p 1233-1237, September, 1980. 2 Fig, 3 Tab, 3 Ref.

Descriptors: *Water pollution, *Heavy metals, *Rivers, *Industrial wastes, Cadmium, Copper, Lead, Estuaries, Sea water, Analytical techniques, Japan, Kitakyushu, Dokai Bay(Japan).

Heavy metals concentrations in the aquatic environment of the Kitakyushu district in Japan were investigated from 1976 to 1977. Cadmium, copper and lead samples were analyzed for all rivers which run through the area, the bay, and the sea surrounding the district. Results obtained were compared with values found in the literature for metals concentrations in other parts of the world. This comparison showed no significant pollution except for concentrations of lead in Dokai Bay, which averaged 40 micrograms per liter. The industrial activity surrounding the bay was responsible for the high concentrations of lead. (McKeon-FRC)

LINEAR ALKYLBENZENE SULFONATES IN RIVER, ESTUARY AND BAY WATER,
Tokyo Metropolitan Univ. (Japan), Dept. of Chemistry.
H. Hon-nami, and T. Hanya.
Water Research, Vol 14, No 9, p 1251-1256, September, 1980. 4 Fig, 3 Tab, 13 Ref.

Descriptors: *Rivers, *Estuaries, *Sea water, *Alkylbenzene sulfonates, Bays, Detergents, Foaming, Analytical techniques, Biodegradation, Statistical methods, Water pollution, Japan, Tama River(Japan), *Tokyo Bay.

Linear alkylbenzene sulfonates (LAS) in aquatic environments were determined by combined gas-liquid chromatography (GLC) and mass spectrometry (MS). LAS were determined as their methyl sulfonate derivatives by GLC-MS. The ratios of the concentrations of LAS to those of methylene blue active substances (MBAS) in river and bay water were estimated to be 0.40-0.85 and less than 0.20 respectively. The major components of LAS in the commercial detergent were the C(11) and the C(12) LAS. The LAS composition in the waters did not vary appreciably with season or with sampling location. In river and estuary water, compared to commercial detergent, the proportions of C(12) and C(13) LAS decreased, while those of C(10) and C(11) LAS increased. The 2-phenyl isomer decreased. These findings agree with predictions based on biodegradation rates of pure LAS in river water. The LAS composition in bay water did not follow these predictions; the proportions of C(10) and C(11) LAS slightly decreased while those of C(12) and C(13) LAS increased compared with the river and estuary waters. POTENTIAL SIGNIFICANCE OF INSECTS IN THE REMOVAL OF CONTAMINANTS FROM AQUATIC SYSTEMS,
EG and G, Inc., Waltham, MA.
C. A. Menzie.
Water, Air, and Soil Pollution, Vol 13, No 4, p 473-479, December, 1980. 1 Fig, 2 Tab, 22 Ref.

Descriptors: *Insects, *Water pollution, Sediments, Chemical wastes, Aquatic insects, Aquatic soils, Wastes, Path of Pollutants, Mathematical models, Bioindicators, Water quality, Projections.

Insects which live in water and sediments during the larval stage may remove chemical contaminants from this system when they leave the aquatic environment as adults. The extent of contamination removal was estimated by a simple model using the following factors: concentration of chemical contaminant, time interval, production of larval biomass, bioconcentration factor, proportion of biomass removed by adult emergence, density of sediment, and depth of sediment. Three levels of insect production (100, 15, and 1 gram per square meter per year) and 3 bioconcentration factors (10,000, 1,000, and 100X) were considered. Using the highest production and bioconcentration figures, insects could remove 50% of contamination from a 30 cm thick sediment layer in 1.2 years. The lowest production and bioconcentration conditions would require 12,000 years for the same 30 cm sediment. Moderate production levels with bioconcentration factor of 10,000 would result in removal of 50% of the contamination in 8 years; a factor of 1,000, 80 years. (Cassar-FRC)

CASE STUDIES OF ACRYLAMIDE POLLUTION RESULTING FROM THE INDUSTRIAL USE OF POLYACRYLAMIDES,
Plymouth Polytechnic (England). Dept. of Environmental Science.
L. Brown, M. M. Rhead, and K. C. C. Bancroft.
Water Pollution Control, Vol 79, No 4, p 507-510, November, 1980. 2 Tab, 16 Ref.

Descriptors: *Acrylamide, *Polyacrylamides, *Industrial wastes, Water pollution sources, Pulp and paper industry, *Waste water treatment, Polymers, China industry, Pollutant identification, Potable water.

Acrylamide, which has a low recommended concentration (0.25 micrograms per liter) in potable waters, biodegrades slowly. Therefore, effluents from several industries using polyacrylamides were analyzed to determine acrylamide levels. Process waters and effluents from a china clay factory which recycles water showed no acrylamide (detection limit, 0.2 micrograms per liter). A laboratory-scale 100 fold overdose of polymer resulted in an acrylamide concentration of 11.2 micrograms per liter. No detectable acrylamide was found in effluents from a sewage works using polymers for sludge conditioning. A deliberate 100-fold overdose in a settlement tank showed a maximum of 0.7 micrograms per liter in stream water receiving the effluent. In tests at 3 paper mills, no detectable acrylamide was found in 2 mills. The third mill showed about 10 micrograms per liter in pulping recycle water. Final effluent contained less than 1 microgram per liter, and river water below effluent discharge, less than 0.2 micrograms per liter. It was determined that high acrylamide levels in recycle water were a result of the waste paper reclamation process. Chlorination of water smaples containing acrylamide (0 to 500 micrograms per liter) did not reduce acrylamide concentration. (Cassar-FRC)

MOUNTAIN RESIDENTIAL DEVELOPMENT-MINIMUM WELL PROTECTIVE DISTANCES-WELL WATER QUALITY,
California State Univ., Northridge. Dept. of Health Science.
K. L. Ford, J. H. Schott, and T. J. Keefe.
Journal of Environmental Health, Vol 43, No 3, p 130-133, November/December, 1980. 1 Fig, 3 Tab, 9 Ref.

Descriptors: *Well spacing, *Water pollution control, *Water quality, Colorado, Domestic wastes, Waste water disposal, Wells, Septic tanks, Coliforms, Nitrates, Jefferson County(CO).

Well water samples were collected and wells were inspected in 164 sites within a 300 square mile area in a mountainous portion of Jefferson County, Colorado, an area which has experienced rapid population growth. Analysis for coliform bacteria and nitrate nitrogen revealed that coliform contamination was not related to lot size or distance from waste water effluent sources. However, there was a definite relationship between nitrate-nitrogen concentration and these factors. A statistical study

showed that wells with a protective distance of 100 feet had a 21.8% probability of contamination (greater than 10 mg per liter of nitrate-nitrogen); a 200 foot distance reduced the probability to 9.4%. Therefore, a 200 foot minimum distance from the nearest effluent source was recommended. This requires a lot size of about 2 acres. (Cassar-FRC)

THE EFFECT OF STORM INTERVAL ON THE TRANSPORT OF SOLUBLE PHOSPHORUS IN RUNOFF,
Oklahoma State Univ., Stillwater. Dept. of Agronomy.
A. N. Sharpley.
Journal of Environmental Quality, Vol 9, No 4, p 575-578, October/December, 1980. 5 Fig, 3 Tab, 17 Ref.

Descriptors: *Phosphorus, *Rainfall-runoff relationships, Movement, *Storm runoff, Soil chemical properties, Simulated rainfall, Model studies, Nutrients, Watersheds, Water quality, Enzymes, Organic compounds, Soil water, Water pollution, Percolation, Leaching, Path of pollutants, *Okalohoma.

The effect of varying the interval between runoff events on the level of soluble phosphorus was examined under conditions of simulated rainfall in Oklahoma. During each runoff event the levels of soluble phosphorus decreased. When the interval between each pair of runoff events was decreased from 1 day to 5 minutes, the soluble phosphorus levels increased from 0.027 to 0.033 milligrams/liter in Bernow fine sandy loam, and from 0.020 to 0.028 milligrams/liter for Woodward loam soils. This was suspected to be due to a movement of soil water down the profile after the runoff process ended, which caused a reduction in the pool of soluble phosphorus in the surface soil that is susceptible to leaching during runoff. Contrastingly, when event intervals were increased from 1 to 6 days, a marked increase in the mean concentration of soluble phosphorus in runoff was noted. Mean levels of soluble phosphorus under these conditions rose from 0.018 to 0.026 milligrams/liter for Bernow and 0.011 to 0.041 milligrams/liter for Woodward soils. This increase was correlated with the phosphatase enzyme activity of the soils examined, and therefore could be partially due to organic phosphorus mineralization. (Geiger-FRC)

LOSS OF CHLORPHYRIFOS IN POND WATER: EXAMINATION OF RESULTS USING THREE SIMPLE MATHEMATICAL MODELS,
Manitoba Univ., Winnipeg. Pesticide Research Lab.
G. J. Reimer, and G. R. B. Webster.
Journal of Environmental Science and Health, Part B, Vol 15, No 5, p 559-569, 1980. 2 Tab, 7 Ref.

Descriptors: *Chlorpyrifos, *Water pollution, *Pesticide kinetics, Model studies, Mathematical models, Pollutants, Pesticides, Halogenated pesticides, Persistence, Degradation, Ponds.

Two formulations of chlorpyrifos, the active ingredient in Dursban insecticide, were added at the recommended dose of 0.04 mg per 100 liters to outdoor pools during the summer months. Half-life of the emulsifiable concentrate was 5 + or - 3 hours; of slow release granules, 14 + or - 4 hours. This data was analyzed using three simple mathematical models: a power rate model, a hyperbolic rate model, and an empirical power function. The average correlation coefficients were approximately 0.78, 0.84, and 0.76, indicating that all models showed similar performance. (Cassar-FRC)

INVESTIGATIONS OF PIPE-BORNE WATER POLLUTION IN BENIN CITY, NIGERIA,
Benin Univ. (Nigeria). Dept. of Biological Sciences.
E. J-Nkanga.
Water, Air, and Soil Pollution, Vol 13, No 4, p 425-437, December, 1980. 6 fig, 6 Ref.

Descriptors: *Benin City(Nigeria), *Water pollution sources, *Public health, *Bacteria, Water quality, Coliforms, Construction, Plumbing, Domestic wastes, Pipes, Septic tanks, Soil disposal fields, Rainfall, Potable water, *Nigeria.

The source of the high level of bacterial contamination in the public water supply of Benin City, Nigeria, was investigated. The combined effects of rainfall with excessive construction work and the inadequate plumbing codes were identified as the two most important causes of this pollution. Construction on roads, use of an underground sewage collection system, and a telephone cable installation led to frequent water pipe breaks. Samples were taken in 4 main zones characterized, respectively, by extensive road construction, combined construction projects, no public construction, and a residential area using toilets with septic tanks and disposal fields. Samples were also collected at pumping stations and a river to determine the quality of the water before passing through consumer pipelines. Peak rainfall periods corresponded with peak coliform counts in areas of heavy construction. Rainfall had little effect in the area where construction was insignificant. Contamination increased from 12 coliforms per 100 ml to 60 per 100 ml as water lines passed through an area containing septic tanks and drain fields. Artificial contamination studies showed that rainfall increased bacterial count in pipe-borne water passing through absorption fields. (Cassar-FRC)

HEAVY METAL INPUTS TO MISSISSIPPI DELTA SEDIMENTS--A HISTORICAL VIEW,
Texas A and M Univ., College Station. Dept. of Oceanography.
B. J. Presley, J. H. Trefry, and R. F. Shokes.
Water, Air, and Soil Pollution, Vol 13, No 4, p 481-494, December, 1980. 7 Fig, 2 Tab, 34 Ref.

Descriptors: *Heavy metals, *Rivers, Mississippi River, Lead, Cadmium, *Water pollution, Sediments, Zinc, Trace elements, Deltas, Waste dilution, Municipal wastes, Industrial wastes, *Mississippi Delta.

Sampling and analysis of suspended particulates, filtered water, and sediments from the Mississippi River, its delta, and adjacent marshes during 1974-1976 showed that sediment Cd and Pb concentrations increased by 70% and 200% respectively over the past several decades. Particulate matter in the river contains more than 90% of the metal load, which resembles the chemical composition of average rocks in levels of Fe, Al, V, Cr, Cu, Mn, and Ni. However, Pb and Zn are about 3 times more concentrated in river particulates than in the average rock crust; Cd, 7 times. River particulate matter and delta sediments are similar in levels of Al, Fe, Cr, V, Cd, and Pb, but Co, Cu, Mn, Ni, and Zn in sediments are 20 to 40% less, probably due to diagenic losses. Dissolved metal concentrations, similar to world average values for rivers, were below limits for safe drinking water. The Mississippi River is capable of carrying enormous loads of industrial and municipal metal wastes without significantly increasing background metal levels. This is possible because of the abundant suspended matter, high pH, and large volume of water. (Cassar-FRC)

DEVELOPMENT OF A WINTERTIME BIOMONITOR FOR HEAVY METALS IN FLOWING WATERS,
Michigan Technological Univ., Houghton. Dept. of Biological Sciences.
J. M. Glime, and R. R. Keen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-157067, Price codes: A04 in paper copy, A01 in microfiche. Institute of Water Research, Michigan State University, Project Completion Report, January, 1981, 50 p, 4 Fig, 18 Tab, 37 Ref. OWRT A-107-MICH(1), 14-34-0001-0124.

Descriptors: *Bioindicators, *Mosses, *Lake Superior, Monitoring, Water quality, Biomonitor, Winter, Aquatic moss, *Heavy metals, Copper, Cadmium, *Fontinalis, Aquatic toxicology, Alkalinity, Humic acids.

Two species of Fontinalis were cultured at 1 and 5C in Lake Superior water with experimentally varied alkalinity and humic acid, copper and cadmium concentrations, to determine the suitability of using these mosses as wintertime biomonitors for heavy metal contamination. Both species exhibited growth and healthy appearance at 1 and 5C. Alkalinity and humic acids had no significant effect on the chlorophyll content or appearance of the moss within the range of concentrations known in Michigan. Copper caused reduced chlorophyll and visible loss of color at 1 mg/l in four days at 1C. Cadmium caused reduced chlorphyll and visible loss of color only at 35 upsilon g/l and above after 10 days of exposure at 1C. Cellular re-organization paralleled color response to both copper and cadmium. Several species of mosses were compared for ease of recognizing stress symptoms. Fontinalis hypnoides var. duriaei and Eurhynchium riparioides had the most easily recognized macroscopic response.

INDICATOR-ORGANISM PERSISTENCE IN ACID-MINE-WATER ENVIRONMENTS,
West Virginia Univ., Morgantown. Water Research Inst.
N. E. Carlson, and G. K. Bissonnette.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-157075, Price codes: A03 in paper copy, A01 in microfiche. Technical Completion Report, 1981. 41 p, 8 Fig, 8 Tab, 58 Ref. OWRT-A-039-WVA(1), 14-34-0001-0152.

Descriptors: *Acid mine water, *Bioindicators, *Coliforms, Microbiology, *Sewage bacteria, Streptococcus, *Water quality, Bacteria, Domestic wastes, E. Coli, Enteric bacteria, Microorganisms, Mine water, Sewage effluents, Waste water(Pollution), Water pollution.

Persistence of indicator organisms (total coliforms, fecal coliforms, and fecal streptococci) associated with natural samples of raw, primary- and secondary-treated sewage was studied following in-situ exposure to five aquatic environments. Three of these streams contained significant amounts of acid mine drainage. The other two streams were relatively uncontaminated. Indicator organisms were rapidly killed upon exposure to the acid-mine systems. In most cases, the survivors were reduced more than 90% within 30 minutes. Little reduction in numbers was observed in the uncontaminated streams. Seasonal changes affected survival of indicators as reflected by slightly prolonged persistence at colder in-situ water temperatures. The fecal coliform group was most susceptible to the acid-mine-water stress. The fecal streptococci were the most persistent. An enrichment technique resulted in substantially enhanced recovery of sublethally-injured survivors of acid stress. Enrichment was particularly beneficial for recovery of acid-injured fecal coliforms. Relatively little improvement in recovery of fecal streptococci was afforded by the enrichment technique.

SEASONAL FLUCTUATIONS OF MAJOR DIATOM SPECIES AT FIVE STATIONS

ACROSS LAKE MICHIGAN, MAY 1970-OCTOBER 1972,
Michigan Univ., Ann Arbor. Dept. of Atmospheric and Oceanic Sciences.
R. E. Holland.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-110975, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/3-80-066, July, 1980. 95 p, 33 Ref, 2 Append. R-805133-01-1.

Descriptors: *Lake Michigan, *Diatoms, *Eutrophication, *Seasonal, Phytoplankton, Aquatic environment, Nutrients, Water pollution, Great Lakes, Aquatic productivity, Solar radiation, Summer, Winter, Plant populations, Temporal distribution, Distribution patterns.

Recent investigations have demonstrated significant differences between inshore and offshore waters in Lake Michigan which show that inshore environments are deteriorating at a much faster rate than offshore environments. In the past, conclusions concerning changes in the Great Lakes have been based on data from inshore water samples, and engineering studies have been based upon the assumption that the entire volume of the lake was available for dispersion of pollutants. From 27 May 1980 to 4 October 1972, water samples were collected from five stations on a transect across Lake Michigan from Milwaukee, Wisconsin to Ludington, Michigan. At all stations, diatoms reached their highest abundance in late spring to early summer. These periods of greatest abundance of total diatoms were the result of the rapid growth of one or two species. Stephanodiscus hantzschii was the dominant species at Station 1, off Milwaukee, and Rhizosolenia eriensis was the dominant species or one of the predominant diatom when highest yearly numbers were reached at Stations 3 and 5 in August, 1972. Highest winter numbers were reached at Station 1 on 22 February, 1972 when Stephanodiscus minutus was dominant at all stations. Solar radiation appears to be the limiting factor in the productivity of winter plankton. There were differences between inshore and offshore stations, but Station 1 was most distinct and reflected the continued input of nutrients from the Milwaukee area. (Moore-SRC)
W81-01223

AN EVALUATION OF HAZARDOUS CHEMICALS IN LAKE ONTARIO DURING IFYGL,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
G. F. Lee.
Environmental Protection Agency Report EPA-600/3-80-060, July, 1980. 34 p, 1 Fig, 9 Tab, 8 Ref. R-803187.

Descriptors: *Lake Ontario, *Heavy metals, *Water pollution, *Chlorinated hydrocarbon pesticides, *Polychlorinated biphenyls, Water quality, Great Lakes, Fish, DDT, Cadmium, Zinc, Chromium, Copper, Fluoride, Iron, Lead, Nickel, Manganese, Ammonia, Dieldrin.

Data collected during the International Field Year for the Great Lakes (IFYGL) studies during 1972-73 on Lake Ontario are summarized relative to either recommended International Joint Commission (IJC) Research Advisory Board water quality objectives or Environmental Protection Agency Quality Criteria for Water. Data from 247 stations are summarized for the following parameters: cadmium, zinc, chromium, copper, fluoride, iron, lead, nickel, manganese and ammonia. Almost all reported measurements for total cadmium exceeded the IJC water quality objective of 0.2 microgram/l by at least five times. Values reported for copper also showed a high percentage of measurements equal to or in excess of the recommended IJC water quality objective. Other metals showed more regional patterns of values equalling or exceeding water quality objectives. The concentrations polychlorinated biphenyls, dieldrin and DDT and its metabolites in water and fish were found to exceed both the IJC water quality objectives and the Quality Criteria for Water. The polychlorinated biphenyl content of the water ranged from 40 to 97 ng/l with an average of 55 ng/l, which is 50 times the Quality Criteria for Water. If the IFYGL data are representative of Lake Ontario conditions, studies need to be conducted to evaluate whether these concentrations are indicative of water quality deterioration. (Moore-SRC)

RESULTS OF A LIMNOLOGICAL STUDY OF LAKE POCASSE, SOUTH DAKOTA,
Water and Power Resources Service, Denver, CO. Engineering and Research Center.
R. A. Roline, and J. F. LaBounty.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-141905, Price codes: A03 in paper copy, A01 in microfiche. Report REC-ERC-80-4, June, 1980. 47 p, 22 Fig, 16 Tab, 31 Ref.

Descriptors: *Limnology, *Water chemistry, *Heavy metals, *Anaerobic conditions, South Dakota, Water temperature, Dissolved oxygen, Cyanophyta, Primary productivity, Nutrients, Sediments, Zooplankton, Aquatic life, Eutrophication, Copper, Lead, Zinc, Manganese, Iron, Polychlorinated biphenyls, Water pollution, *Lake Pocasse(SD).

In 1977-78, a limnological study was done on Lake Pocasse, South Dakota, to evaluate the present condition of the lake and to assist in the feasibility decision of using the lake as a regulating reservoir. The shallow depth (3 to 4 m) allows for water temperatures during the summer to reach 25 degrees C with very little stratification. The dissolved oxygen in the water is usually maintained at levels adequate for the survival of aquatic organisms during the ice-free period, but may frequently approach anaerobic conditions during winters with heavy snow and ice cover. Potentially toxic levels of the heavy metals copper, lead, zinc, manganese, and iron have been measured, but these elements are usually in the less harmful particulate form. Anaerobic conditions may contribute to the release of the ionic forms of heavy metals which are highly toxic to aquatic life. No insecticides or herbicides were detected in any of the samples except for the Spring Creek sample which contained 0.001 mg/l polychlorinated biphenyls. The levels of nitrogen and phosphorus compounds measured accounted for the high primary production during the late summer and fall. A bloom of the blue-green alga Aphanizomenon flos-aquae (L.) Ralfs occurred during this period. Zooplankton populations generally were greatest during midsummer and the population of benthic organisms continued to increase throughout the season. Lake Pocasse appears to act as a trap for sediments, nutrients, and heavy metals because of limited and irregular flushing. (Moore-SRC)

MOVEMENTS OF LAKE TROUT IN TWIN LAKES, COLORADO, IN RELATION TO THE MT. ELBERT PUMPED-STORAGE POWERPLANT,
Colorado Cooperative Fishery Research Unit., Fort Collins.
L. A. Walch.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-130049, Price codes: A04 in paper copy, A01 in microfiche. Engineering and Research Center, Water and Power Resources Service, Report REC-ERC-79-17, July, 1980. 76 p, 15 Fig, 4 Tab, 90 Ref, 9 Append.

Descriptors: *Lake trout, *Fish behavior, *Entrainment, *Pumped storage, Environmental effects, Colorado, Seasonal, Tailrace, Water temperature, Distribution, Movement, Fish management, Powerplants, Reservoirs, Diurnal distribution, Depth, *Twin Lakes(CO).

Mean movement rates of 34 lake trout (Salvelinus namaycush) tagged with ultrasonic transmitters in Twin Lakes, Colorado, ranged from 1.1 m/min in the fall to 1.6 m/min in the summer. Movement rates between 0830 and 1130 were significantly higher than between 2230 and 0500 during spring, summer, and fall. During the fall, afternoon movements were significantly greater than night movements. Home range sizes of lake trout were larger during the spring, summer, and fall than during the winter. Of the home ranges observed, at least 40% were found in the proximity of the tailrace at all times of the year. More excursions out of home ranges occurred during the spring and fall than during the summer or winter. Gill netting data indicated that lake trout were more likely to be found near the tailrace during spring and fall than during summer or winter. During the summer, lake trout were found to prefer deep areas of the lower lake. Between July and October, they occupied depths where water temperatures in the lower and upper lakes averaged 10.5 and 8.5 degrees C, respectively. Few excursions into water warmer than 12 degrees C occurred. Most lake trout were found within 3 m of the bottom. Movements of fish to within 15 m of shore occurred in all seasons and usually took place between 0600 and 1300. Ripe lake trout were captured at depths ranging from 1.5 to 12 m, but were not captured near the powerplant. It is likely that the lake trout of Twin Lakes will be least vulnerable to entrainment by pumping operations between 2230 and 0500 and most vulnerable between 0830 and 1130 during spring, summer, and fall. Seasonally, they will be least vulnerable in the winter and most vulnerable in the spring.

RELATIVE EFFECTS OF BACTERIAL AND PROTOZOAN PREDATORS ON SURVIVAL OF ESCHERICHIA COLI IN ESTUARINE WATER SAMPLES,
Tasmania Univ., Hobart (Australia). Faculty of Agricultural Science.
J. McCambridge, and T. A. McMeekin.
Applied and Environmental Microbiology, Vol 40, No 5, p 907-911, November, 1980. 1 Fig, 2 Tab, 16 Ref.

Descriptors: *Estuaries, *Coliforms, *Predation, Aquatic habitat, Estuarine environment, Bacteria, Sea water, Microorganisms, E. coli, Sewage bacteria, Cultures, Protozoa, Aquatic life, Microbiology.

The relative effect of protozoan and bacterial predators on the survival of Escherichia coli in estuarine water samples was examined. A bacterial suspension was added to fresh estuarine water samples, and antibiotics were added to determine the effect of bacterial predators alone. The time interval during which predacious protozoa were active in a 10-day-decline period was determined by the exposure of Escherichia coli to these predators for different lengths of time. After this exposure, protozoan predators were inhibited for the remainder of the experiment. Predacious protozoa were found to exert their major influence during the first two days of the decline period. The early effect of protozoa and the suppression of bacterial predators by these protozoa suggest that there may be interacting microbial predators, each playing a distinct role in the destruction of fecal bacteria after their introduction into estuarine conditions. EFFECT OF THE WARM WATER DISCHARGE FROM A POWER STATION ON FISH POPULATIONS IN THE RIVER TRENT,
Central Electricity Generating Board, Ratcliffe-on-Soar (England). Freshwater Biology Unit.
K. Sadler.
Journal of Applied Ecology, Vol 17, No 2, p 349-357, August, 1980. 3 Fig, 4 Tab, 20 Ref.

Descriptors: *Fish, *Water discharge, *Temperature, Heated water, Water temperature, Perches,

Fish behavior, Fish populations, Ecology, Operation and maintenance, Thermal properties, Fish migration, Aquatic environment, Environmental effects, *Power plants, England, River Trent(England).

Seine netting was conducted monthly at stations above and below a power station to determine the effect of warm water discharge on fish populations. Nine species of fish were tracked, three in statistically significant quantities. Statistical tests were conducted where possible. Results indicate that fish population densities and species diversity were greater downstream in warmer waters. Reduction in catch during the winter months suggests a seasonal migration. This reduction occurred in December in the downstream site, 1 to 2 months later than in the upstream site. Temperature increments caused by power station operation were a mean value of 6 to 8 degrees Centigrade above ambient, with a peak of 28C. Literature data indicates that 30C is the point at which thermal stress in fish appears. (Titus-FRC)

EFFECT OF VARYING MG/CA RATIO AND ELECTROLYTE CONCENTRATION IN THE IRRIGATION WATER ON THE SOIL PROPERTIES AND GROWTH OF WHEAT,
Central Soil Salinity Research Inst., Karnal (India).
J. S. P. Yadav, and I. K. Girdhar.
Plant and Soil, Vol 56, No 3, p 413-427, September, 1980. 5 Fig, 7 Tab, 23 Ref.

Descriptors: *Wheat, *Irrigation water, Magnesium, Water quality, Calcium, Soil properties, Salinity, Electrolytes, *Crop response.

The effect of irrigation waters having varying Mg/Ca ratios (2, 4, 8, and 16) and electrolyte concentrations (20 and 80 meq/liter) on growth of wheat in pots was studied using two different soils. The two soils were a heavy-textured black soil dominated by montmorillonite clay and a light-textured alluvial soil with illite type clay. As irrigation water of higher electrolyte concentration was used, salinity increased. The rate of increase was greater in the heavy soil. Soluble salts accumulated in the surface layers of both soils when saline water was applied. As the Mg/Ca ratio and electrolyte concentration of the irrigation water increased, the Na and Mg absorption in the soils increased, and the wheat crop was significantly reduced. Effects were more pronounced in the heavy soil than in the light alluvial soil. Soil pH increased with increases in Mg/Ca ratio and decreased with increases in electrolyte concentration. Soil pH was higher in the surface layer than in the subsurface layer. (Cassar-FRC)

AN EQUITABLE APPROACH TO POLLUTION CONTROL WITH PARTICULAR REFERENCE TO THE THAMES ESTUARY,
Thames Water Authority, London (England). Directorate of Scientific Services.
L. B. Wood, and A. G. Cockburn.
Progress in Water Technology, Vol 12, No 3, p 83-91, 1980. 3 Fig, 1 Tab, 4 Ref.

Descriptors: *Equity, *Oxygen requirements, *Estuaries, Dissolved oxygen, Fish, *Water pollution control, Salinity, Flow, Mathematical models, Rivers, Thames River(England), England.

The preparation of the pollution budget for the Thames Estuary is described with special reference to biodegradable loads. Also, the extension of the procedure to other substances is discussed. The Thames Estuary is divided into three salinity zones: Canvey Island to the North Sea, London Bridge to Canvey Island, and Teddington to London Bridge. In the first zone, the minimum percentage of air saturation with dissolved oxygen must be at least 60% in 95% of the samples collected. The water must be suitable for the whole life cycle of marine organisms. In the second zone, dissolved oxygen must be at least 40% in 95% of the samples, and the water must be non-toxic to fish. The dissolved oxygen pollution budget is related to the effects of biodegradable discharges in the third quarter of the year. The parameter for measuring potential pollution load is the Effective Oxygen Load, which equals 3/2 times the oxidizable nitrogen in mg/liter, times the flow rate in cu m/day, times 10 to the sixth power. Mathematical modelling using the steady-state model (Barrett, Mollowney, and Casapieri, 1978) is used to evaluate the discharge standards for an effluent in a particular area. (Small-FRC)

THE STATE OF THE NILE ENVIRONMENT: AN OVERVIEW,
United Nations Environmental Programme, Nairobi (Kenya).
E. E. El-Hinnawi.
Water Supply and Management, Vol 4, No 1-2, p 1-11, 1980. 2 Fig, 1 Tab, 18 Ref.

Descriptors: *Rivers, *Environmental effects, *Dam construction, Lakes, Watersheds(Basins), Eutrophication, Aquatic plants, Bacteria, Dissolved oxygen, Human diseases, *Nile River, Kenya.

The main environmental changes that have occurred or are anticipated as a result of development of the Nile basin are reviewed. The most important environmental impacts are related to the construction of dams and the creation of manmade lakes. The filling of a new lake causes geochemical and biochemical changes such as stratification, eutrophication, bacterial growth, and deoxygenation. Water hyacinth, water fern and water lettuce increase water loss by evaporation and use nutrients which could be used by fish. Placid lake waters as well as the rapid flows through dam sluices have aided the spread of water-borne human disease. The concept of ecodevelopment is explained, and monitoring is urged to protect the Nile, one of the world's least polluted rivers. (Small-FRC)

WATER SUPPLY PROBLEMS IN THE CONSTRUCTION AND OPERATION OF AN OIL PIPELINE: A CASE STUDY OF THE SAINT LAWRENCE LOWLANDS,
Institut National de la Recherche Scientifique, Rimouski (Quebec).
D. Couillard.
Water Supply and Management, Vol 4, No 5/6, p 397-407, 1980. 1 Fig, 1 Tab, 22 Ref.

Descriptors: *Potable water, *Oil spills, *St. Lawrence River, Quebec, Groundwater, Water pollution sources, Pipelines, Rivers, Water quality, Oil industry, Engineering structures, Leakage, Environmental effects, Pollution.

Effects of oil spills from construction and operation of a proposed petroleum pipeline and tank farms on the south shore of the St. Lawrence River, Quebec, on the water supply in this area are discussed. Within the study area there are over 75 localities which draw their water supply from rivers. Twenty-seven communities and numerous individual households depend on groundwater. The quality of river water and groundwater varies but is generally good. The most serious result of oil leakage into the environment would be contamination of the groundwater. In sand and gravel aquifers, pollution disperses quickly over a large region and degrades very slowly. Since the pipeline will cross many water courses, a spill could contaminate a community's water potable supply and adversely affect aquatic life. Chlorination of a water source containing even trace amounts of oil can produce phenolic compounds with disagreeable taste and odor. Contamination of rivers disperses more quickly than in groundwater. Nevertheless, emergency plans and alternative sources should be formulated by each community. A temporary adverse effect of pipeline construction is increased sediment loads in the water. (Cassar-FRC)

DETRIMENTAL EFFECTS OF PHARMACEUTICAL INDUSTRIAL WASTE ON MICROORGANISMS,
Z. H. Coll. of Engineering and Technology, Aligarh (India). Environmental Research Lab.
M. Ajmal, A. Ahmad, M. Z. Hasan, and A. A. Nomani.
Water, Air, and Soil Pollution, Vol 13, No 4, p 447-452, December, 1980. 4 Fig, 1 Tab, 9 Ref.

Descriptors: *Microorganisms, *Industrial wastes, *Pollutants, Bacteria, Antibiotics, Chemical wastes, *Pharmaceutical wastes, Environmental effects.

A sample of industrial waste from Cooper Pharma Limited, Ghaziabad, India, manufacturer of products including vitamins, aspirin, and anitbiotics, was analyzed and its effects on microorganisms determined. The pungent, yellow material, pH 5.5, had the following properties, expressed in mg per liter: suspended solids, 455; total solids, 2520; dissolved solids, 1780; and turbidity, 985. Chemical properties, also listed in mg per liter, were: BOD, 390; COD, 1850; organic nitrogen, 24; inorganic nitrogen, 12.5; sulfur, 5.1; chlorides, 14.9; sulfates, 9.5; phosphates, 4.2; volatile solids, 280; and dissolved oxygen, nil. Varying volumes of the waste, ranging from 0.5 ml to 12 ml, were added to 300 ml BOD bottles, which were then filled with distilled water. Bacterial cultures, saprophytic, nitrifying, and a combination of both, were added. Results showed that 0.5 ml of waste had no detrimental effects on any bacteria. Slight effects were noticed at 1 or 2 ml. Definite detrimental effects were seen at 10 to 12 ml for each bacterium separately and in combination. The author suggests that large volumes of pharmaceutical industrial waste should not be discharged into the environment without dilution or treatment. (Cassar-FRC)

DOES DRINKING WATER HARDNESS AFFECT CARDIOVASCULAR DISEASE,
Delaware Div. of Public Health, Dover.
M. Joyce.
Journal of Environmental Health, Vol 43, No 3, p 134-139, November/December, 1980. 6 Tab, 16 Ref.

Descriptors: *Potable water, *Cardiovascular disease, *Hardness(Water), Magnesium, Calcium, Public health, Water quality, Metals, Trace elements.

The relationship of drinking water hardness to cardiovascular disease is reviewed by examining published literature. Higher cardiovascular disease mortality rates are found in soft water areas than in hard water areas. General conclusions are that hard water may lower intestinal absorption of toxic metals, trace elements (chromium, vanadium, lithium) normally associated with hard water may contribute to proper nutrition and better general health, and the corrosive effect of soft water may cause higher levels of harmful materials (lead, cadmium, and copper) in drinking water. Calcium and magnesium, common constituents of hard water, appear to have a protective effect against cardiovascular disease. If further clarification of these relationships proves that cardiovascular disease is caused by certain drinking water trace elements, current water treatment practices should be modified. THE EFFECTS AND CONTROL OF ALGAL BLOOMS IN FISH PONDS,
Centre Technique du Genie Rural, Monpellier (France). Amenagements Littoraux et Aquaculture.
E. A. Seymour.
Aquaculture, Vol 19, No 1, p 55-74, January, 1980. 2 Fig, 5 Tab, 55 Ref.

Descriptors: *Cyanophyta, *Carp, *Ammonia, Nitrogen, Phosphorus, Aquatic algae, Aquatic weed control, Algal toxins, Fisheries, France, *Fish ponds.

The development of a dense bloom of a blue green alga (Aphanizomenon flos-aquae) in the ponds of a carp farm in the south of France was investigated. Temperature, surface dissolved oxygen, hardness,

and total inorganic nitrogen content of the pond water were measured throughout the season. Changes in the cover of macrophytes in the pond were also determined. About one day after the collapse of the bloom, carp gathered at the inflow to the pond, where they gasped at the surface. Ten days after the bloom collapse, netted carp had distended abdomens and internal hemorrhages. Twenty-one days after the bloom collapse, 10-20% of the carp had skin lesions and other problems. Total carp mortality was only 11%. Concentrations of non-ionized ammonia in the pond were measured after the bloom. These measurements, along with earlier laboratory findings, indicated that infectious dropsy of carp is caused by ammonia. It is suggested that dense blooms of nitrogen-fixing algae can be controlled by manipulation of the nitrogen-phosphorus balance of ponds. (Small-FRC)

5D. Waste Treatment Processes

CAPTURE OF LATEX BEADS, BACTERIA, ENDOTOXIN, AND VIRUSES BY CHARGE-MODIFIED FILTERS,
AMF Cuno, Meriden, CT.
K. Hou, C. P. Gerba, S. M. Goyal, and K. S. Zerda.
Applied and Environmental Microbiology, Vol 40, No 5, p 892-896, November, 1980. 5 Fig, 4 Tab, 12 Ref.

Descriptors: *Filtration, *Microorganisms, Methodology, Filters, Water pollution, Water quality, Kinetics, Laboratory tests, Bacteria, Flow, Waste water treatment, *Water treatment.

A study of filtration methods indicates that electropositive filters are effective in the removal of a wide range of microorganisms over a wide range of pH values and ionic conditions. The use of these filters has potential application in the removal of microorganisms from water, concentration of both bacteria and viruses from water, and harvesting for removal of endotoxins from contaminated parenterals and foods and for immobilization of microbial cells and antigens. These filters depend upon electrokinetic effects on microorganisms and suspended matter which exhibit a net negative charge in most fluids. Electronegative filters of similar porosity and electropositive filters that had been treated to destroy the charge were ineffective under similar conditions. (Titus-FRC)

FULL-SCALE EVALUATION OF HIGH RATE SCREENING DEVICES FOR TREATMENT OF SANITARY SEWAGE BY-PASS FLOW,
Ontario Ministry of the Environment, Toronto. Pollution Control Branch.
H. Kronis, and F. Tonelli.
Environment Canada, Canada-Ontario Agreement on Great Lakes Water Quality Research, Report No 103, 1980. 145 p, 33 Fig, 25 Tab, 11 Ref, 3 Append.

Descriptors: *Bypasses, *Sewage treatment, *Sanitary engineering, *Waste water(Pollution), *Screens, Canada, Infiltration, Flow rates, Routing, Spillways, Channels, Floodways, Disposal, Civil engineering, Effluents, Treatment, Sewage, Wastes, Equipment, Filters, Sieves, Size, Peak discharge, Water pollution control, Storm surge, Technology.

Four fine-mesh high-rate screening devices were evaluated for their ability to treat combined sewage from wet and dry weather conditions. The devices tested were: a 1.5 meter diameter Centrifugal Waste water Concentrator with 105 micrometer screen openings, a 1.5 meter long rotating horizontal drum screen (Rotostrainer) with 500 micrometer apertures, and two stationary inclined screens (one, a 0.6 meter wide stationary hydraulic sieve, the other, a 1.8 meter wide Hydrasieve, having 305 and 762 micrometer apertures, respectively). The study was conducted during 1974-75 at the Belleville, Ontario Water Pollution Control Plant, where influent sewage is subject to substantial infiltration, dilution, and flow peaking during wet weather. Observed hydraulic capacity (16-50 gallons per minute-square foot) and pollutant removal depended largely on screening device type, aperture size, and availability of an effective backwash system. Typical mean pollutant removals during storm events with first flush conditions were: 5-32% for suspended solids, 5-24% for BOD-5, and 23-79% for settleable solids. Pollutant reductions were much less in dry weather. Operating costs (0.6-19 cents/1000 gallons) depended on several factors. It was concluded that screening had potential for pollutant reduction in combined sewer flows. (Zielinski-IPA)

NUTRIENT REMOVAL FROM DRAINAGE WATERS WITH SYSTEMS CONTAINING AQUATIC MACROPHYTES,
Florida Univ., Sanford. Inst. of Food and Agricultural Sciences.
L. R. Sinclair, and R. B. Forbes.
Transactions of the ASAE, Vol 23, No 5, p 1189-1194, October/November, 1980. 1 Fig, 4 Tab, 21 Ref.

Descriptors: *Water pollution treatment, *Aquatic plants, *Lake Apopka(FL), *Nutrient removal, Water quality, Drainage water, Biological treatment, Water treatment, Water hyacinth, Swamps, Muck soils, Najus, Eutrophication.

Water quality was measured at the inflow and outflow of three treatment systems to determine their effectiveness in removing nutrients from agricultural drainage water. The study was adjacent to Lake Apopka, Florida, which has undergone eutrophication during the past 50 years from nutrients added by drainage water from muck farming. A natural swamp was not very effective in improving water quality. Turbidity, sulfate, pH, and nitrates were slightly reduced, and alkalinity, ammonia, phosphate, tannin-lignin, carbon dioxide, and temperature increased slightly. Oxygen concentration decreased significantly. An anerobic system, floating water hyacinths planted in a 16.2 hectare reservoir, improved water quality slightly through the growing season. Nitrates, oxygen, phosphates, and sulfate decreased; other changes were not statistically significant. This method was most effective of the three in nitrate removal. After the water hyacinths started to decay, water quality degenerated. A 0.4 hectare recycle reservoir containing Najus, submerged plants, removed nutrients very effectively. In this aerobic process, alkalinity, ammonia, carbon dioxide, phosphate, tannin-lignin, turbidity, and sulfate decreased significantly, and oxygen and pH increased significantly. This system was effective in winter. The author speculated that a combination of naiad and hyacinth systems might produce improved results. The possibility of using emergent plants such as cat tails was also mentioned. (Cassar-FRC)

FLUID MECHANICS-FOAM FLOTATION INTERACTIONS,
Nevada Univ. System, Las Vegas. Water Resources Center.
R. M. French, and D. J. Wilson.
Separation Science and Technology, Vol 15, No 5, p 1213-1227, June, 1980. 6 Fig, 2 Tab, 10 Ref.

Descriptors: *Mathematical models, *Flotation, Froth flotation, Water pollution treatment, *Fluid mechanics, *Waste water treatment.

A simple mathematical model for describing the interaction of fluid mechanics and surface chemistry in particle attachment to bubbles in foam flotation columns is suggested. This information is insignificant in the study of pollutant removal from waste waters by foam flotation. This model, an air bubble with a single attached floc particle rising in a Stokes flow regime through a liquid pool at the bottom of a batch foam flotation column, was used to calculate the viscous forces acting to separate bubble and particle. Comparisons with previous work showed that magnitudes, but not directions, of viscous forces can be correctly estimated. (Cassar-FRC)

REVERSE OSMOSIS SEPARATION OF THIOSALTS FROM MINING EFFLUENTS,
Barringer Magenta Ltd., Rexdale (Ontario).
K. S. Subramanian, M. Malaiyandi, and V. S. Sastri.
Separation Science and Technology, Vol 15, No 5, p 1205-1211, June, 1980. 6 Tab, 10 Ref.

Descriptors: *Reverse osmosis, *Sulfur compounds, *Mine wastes, *Metals, *Waste water treatment, Membrane processes, Separation techniques, Sulfates, Industrial wastes, Chemical wastes, Effluents, Cellulose acetate.

Reverse osmosis using a cellulose acetate membrane was evaluated as a possible method for removal of thiosalts from mine tailings ponds. Separation of sodium sulfate, sodium thiosulfate, sodium dithionate, potassium thrithionate, and potassium tetrathionate reached a maximum at 300 psig. Separation efficiencies ranged from 82.2% to 92.9%. Twelve plant effluents containing varying thiosalts and metal ions were subjected to reverse osmosis at 300 psig. Tables listing concentrations of each ion before and after treatment indicate that a large percentage of contaminants were removed. Effluent waters were analyzed for metal ion content and found satisfactory for recycling in the plant or discharge into nearby streams. (Cassar-FRC)
W81-01281

WATER HYACINTHS FOR WASTE WATER TREATMENT,
Boyle Engineering Corp., Orlando, FL.
H. W. Haeseker, and S. C. Helle.
Public Works, Vol 111, No 12, p 34-36, December, 1980.

Descriptors: *Water hyacinth, *Waste water treatment, *Effluents, Water levels, Pilot plant, Biochemical oxygen demand, Water balance, Flow, Water pollution, Aquatic plants, Secondary treatment, Tertiary treatment.

The effectiveness of water hyacinths for waste water treatment is discussed. Water hyacinths grow rapidly in nutrient-rich water, producing biomass which can be digested to generate fuel gas or used as a protein source for animals and perhaps humans. The harvested plants can also be composted to produce an organic soil conditioner. Tests in a pilot waste treatment plant in Florida demonstrated that hyacinths have viable potential for waste treatment. Concentrations of total suspended solids and biological oxygen demand were reduced 80 to 90% with an effluent detention period of 5 days. Effluent was applied at rates of 17,000 gallons per day through three channels. Hyacinths were harvested once a month. Loading rates for secondary and tertiary treatment, cost-benefit analyses, and water budgets remain to be determined. (Titus-FRC)

KINETICS OF PURE OXYGEN ACTIVATED SLUDGE,
Technion - Israel Inst. of Tech., Haifa. Dept. of Civil Engineering.
G. Shelef, and M. Green.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 106, No EE6, p 1099-1110, December, 1980. 7 Fig, 4 Tab, 20 Ref.

Descriptors: *Activated sludge, *Aeration, *Kinetics, Oxygen, Sewage treatment, Growth rates, Solubility, Biomass, Dissolved oxygen, Degradation, Wastes, Waste water, Evaluation.

Experiments comparing activated sludge systems aerated by air with those aerated by pure oxygen

found the following kinetic parameters to be identical: yield coefficient, decay coefficient, and substrate removal coefficient. The two systems operated under identical conditions with the exception of dissolved oxygen concentrations, which ranged from 0.3 to 3.0 milligrams per liter in the air system and from 10 to 18 milligrams per liter in the oxygen system. No differences in sludge settling characteristics were noted. Contrary to some claims, the results indicate that the sole advantages of pure oxygen are due to higher partial pressure and the corresponding force of its dissolution. (Titus-FRC)

UPGRADING LAGOON EFFLUENTS WITH ROCK FILTERS,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
G. R. Swanson, and K. J. Williamson.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 106, No EE6, p 1111-1129, December, 1980. 8 Fig, 3 Tab, 19 Ref.

Descriptors: *Algae, *Lagoons, *Sewage treatment, Filtration, Effluents, Filter stones, Oregon, Rocks, Sedimentation, Water pollution, Water quality, Filters, Operation and maintenance, Model studies, Mathematical models, Sewage effluents.

Rock filtration is an effective, low-cost unit process for removing algae from effluents and correspondingly upgrading lagoon treatment. It consists of a submerged bed of rocks through which lagoon effluent passes horizontally. Sedimentation is the primary mechanism of algae removal. A mathematical model of the sedimentation mechanism indicated that total suspended solids removal efficiency is a function of the distribution of algal settling distance in the rock filter. Weekly average effluent biochemical oxygen demand and total suspended solids from the pilot facility in Oregon did not exceed 20 milligrams per liter during a one year study, and settling rates averaged 0.05 meters per day. Rock filters require a minimum of labor for operation and maintenance, and appear to be compatible with typical lagoon facilities. (Titus-FRC)

LIQUID WASTE REDUCTION TECHNOLOGY FOR INDUSTRIES DEMONSTRATED BY THE TREATMENT OF SUGAR BEET WASTE WATER,
Technische Hochschule, Vienna (Austria). Inst. fuer Wasserversorgung Abwasserreiningung und Gewasserschuts.
H. Kroiss.
Progress in Water Technology, Vol 12, No 3, p 263-270, 1980. 6 Fig, 1 Tab, 6 Ref.

Descriptors: *Food processing industry, *Anaerobic digestion, *Aerobic treatment, Activated sludge, *Waste water treatment, Recirculated water, Industrial wastes, Costs, Municipal wastes, Combined treatment, *Sugar beet industry.

Internal and external measures used in the sugar beet industry to reduce liquid wastes are described, and cost estimates are provided. Internal measures, or measures taken during sugar beet processing, include multiple usage of fresh water and simultaneous treatment of the waste water with activated sludge. Effluent quality averages BOD less than 15 mg/liter and COD less than 60 mg/liter after internal biological treatment. Secondary waste water treatment can be applied if internal measures are limited to the removal of settable solids by primary sedimentation and reuse of the mechanically treated waste water for fluming and washing the beets. Several suggested treatment schemes are: (1) Combined treatment in a municipal treatment plant, (2) High rate anaerobic treatment with consecutive treatment in a municipal treatment plant, (3) High rate aerobic treatment with consecutive treatment in a municipal treatment plant, and (4) Low rate aerobic treatment. Costs have been estimated for each. Climbing energy costs make high rate anaerobic treatment attractive. (Small-FRC)
W81-01307

A DESIGN STUDY OF BIOCHEMICAL COMBINED WASTE WATER TREATMENT PLANT,
National Water Board of Finland, Helsinki. Tampere Water District.
P. Rantala.
Progress in Water Technology, Vol 12, No 3, p 271-278, 1980.

Descriptors: *Chemical precipitation, *Trickling filters, *Municipal wastes, Aluminum, On-site investigations, Industrial wastes, Design, Treatment facilities, Finland, Combined treatment, *Waste water treatment.

The design study for upgrading a chemical waste water treatment plant for the city of Tampere (Finland) is described, which evaluated various process modifications. Three modifications were tested which could reach the required effluent standards of BOD less than 25 mg/liter and total phosphorus under 1 mg/liter. Pilot plant studies were carried out over a period of three and one half years for the following: (1) trickling filter with plastic media (Flocor) - post precipitation with aluminum sulfate; (2) simultaneous precipitation, activated sludge with simultaneous ferrous precipitation and a possible pre-precipitation, with existing treatment plant; and (3) simultaneous precipitation with post precipitation with aluminum sulfate. During the tests, the average influent BOD was 250 mg/liter, total phosphorus 8 mg/liter, and suspended solids 300 mg/liter. Simultaneous precipitation was the most economical process for the upgrade. Primary sedimentation could make the process more stable. Good nitrification, however, was not provided. Also, laboratory tests of combined municipal wastes and effluent from a cardboard mill indicated that the two wastes could be treated with no problems. (Small-FRC)
W81-01311

COMPARISON OF CONVENTIONAL INLAND SEWAGE TREATMENT PROCESSES WITH MARINE TREATMENT BY LONG OUTFALLS IN THE YUGOSLAV ADRIATIC REGION,
Taylor (John) and Sons, London (England).
A. J. Price.
Progress in Water Technology, Vol 12, No 1, p 263-277, 1980. 3 Fig, 2 Tab, 14 Ref.

Descriptors: *Outfall sewers, *Waste water treatment, *Oceans, Dilution, *Sewage treatment, Coliforms, Public health, Water pollution sources, Adriatic Sea, Yugoslavia.

The relative merits of providing sewage treatment by conventional inland means and by means of ocean dumping through long outfalls are considered. Satisfactory sewage treatment is necessary to protect the fisheries industry, encourage continued development and tourism in the area, and promote public health. Average figures are presented for effluent quality, and different acceptable methods of inland treatment and sludge treatment are outlined. Marine treatment, dilution and purification of sewage after screening and releasing into the water are outlined. After one half to two hours, most coliform bacteria die when exposed to sun and sea water. After two hours, the natural dilution of the sewage can be as great as 1000 fold. A properly designed marine treatment produces a satisfactory degree of treatment and should be considered for the Yugoslav Adriatic. (Small-FRC)

SCHEME FOR REMEDYING THE EFFECTS OF STORM SEWAGE OVERFLOWS TO THE TIDAL RIVER THAMES,
Thames Water Authority, London (England).
L. B. Wood, P. F. Borrows, and M. R. Whiteland.
Progress in Water Technology, Vol 12, No 3, p 93-107, 1980. 3 Fig, 2 Tab, 6 Ref, 4 Append.

Descriptors: *Oxygenation, *Storm runoff, Dissolved oxygen, Oxygen sag, Urban runoff, Storm drains, Fish kill, Rivers, Absorption, Thames River, United Kingdom.

Storm sewer overflows in London which coincided with certain tidal conditions caused severe dissolved oxygen depletions and fish kills. A solution to this situation is presented. Injection of pure oxygen using a pressure swing adsorption unit applied from a Vitox system on a barge which follows the minimum oxygen sag curve as it moves down river is proposed. One recent storm (1977) discharged a total of 3.9 million tons of storm sewage which resulted in a large fish kill. Dissolved oxygen curves for the day before the storm, the day of the storm, and six days after the storm indicated that insufficient oxygen killed the fish. Compensation by the addition of oxygen could be accomplished by oxygenating the sewage discharges as they pass through discharge stations, oxygenating tributaries, oxygenating power station cooling water, or injection of oxygen in the river at various points. Injection of oxygen by a moving barge will be tested in 1980. (Small-FRC)

TRADE EFFLUENT CONTROL IN LONDON,
Thames Water Authority, London (England). Metropolitan Public Health Div.
L. H. Thompson.
Progress in Water Technology, Vol 12, No 3, p 69-76, 1980. 8 Fig.

Descriptors: *Industrial wastes, *Regulation, *Costs, Industrial water, *Effluents, Waste water treatment, Cadmium, Heavy metals, Sludge disposal, London, United Kingdom.

Under current United Kingdom law, Water Authorities must control industrial effluents under a consent procedure. Industry must give advance notice of intent to discharge wastes into waterways, and Water Authorities can prohibit or limit the discharge of various substances. Effluent control is designed to protect the environment as well as the waste water treatment facilities and personnel. The volumes of industrial effluents in London today are presented. These vary from almost 100 cu m x 10 to the third power per working day for the brewing and food processing industry to less than 10 cu m x 10 to the third power per working day for textiles and tanning. The annual cost of treatment is less than 1500 British Pounds Sterling for the average industrial location. The control of heavy metals, particularly cadmium, in waste sludges is discussed. The current limit for cadmium in waste effluents is set at 1 mg/liter. When standards are met, the sludge can be disposed of on land. (Small-FRC)

INDUSTRIAL WASTE CONTROL PROCEDURES IN THE CITY OF LOS ANGELES, CALIFORNIA, U.S.A.,
Los Angeles Bureau of Sanitation, CA.
W. F. Garber.
Progress in Water Technology, Vol 12, No 3, p 23-55, 1980. 1 Fig, 7 Tab, 2 Ref, 2 Append.

Descriptors: *Industrial wastes, *Toxins, *Water pollution sources, Water pollution control, California, Cities, Regulation, Municipal wastes, Domestic wastes, Los Angeles, Non-point pollution.

The point source industrial waste control system of Los Angeles, California, which has been in operation since 1950, presently achieves almost complete control. This well-run, well organized industrial waste control program operating under city, state and federal controls is described. Control of non-point sources including domestic inputs or those which may infiltrate past manhole covers is to some degree impossible in Los Angeles. Regulations for the control of toxins must recognize these non-point background levels. If water quality standards are based on zero risk, the only way to control non-point emissions may be to eliminate the manufacture or use of the offending toxin. Minimum background levels for non-point sources are urged. Industrial waste sources in the Los Angeles area are detailed. (Small-FRC)

INNOVATION SIMPLIFIES CONSTRUCTION AND TREATMENT,
O'Brien and Gere Engineers, Inc., Syracuse, NY.
B. N. Gidlow.
Water and Wastes Engineering, Vol 17, No 11, p 25-27, 31, November, 1980. 2 Fig.

Descriptors: *Waste water treatment, *Treatment facilities, Tertiary treatment, *Sewage treatment, Sludge disposal, Computers, Water pollution control, Lakes, Industrial wastes, Water pollution, Costs, Chlorination, Sludge treatment, Phosphorus, Syracuse(NY), New York, Onondaga Lake(NY).

The renovation of the Metropolitan Syracuse Sewage Treatment Plant has been completed, and some innovations of the facility and its expanded uses are described. The plant will help to improve the quality of Onondaga Lake through its new tertiary treatment procedures for industrial effluents. The $92 million expansion provided for installation of an extensive computer control system and for phosphate removal facilities which utilize industrial wastes. The facility has the world's longest prestressed concrete piles to support 26 new process structures, phosphate removal areas, and sludge disposal and waste beds. Pilot plant studies were used to arrive at the most suitable treatment procedures for the area, which finally included primary treatment, secondary treatment, chlorination, tertiary treatment, discharge and sludge handling units. Preliminary treatment areas and low lift pumps are also part of the on-site equipment. Sludge gas produced as a byproduct of sludge digestion is stored to fuel the plant's boiler. Sludge may also be picked up by trucks after dewatering for deposit at landfills. Plans for computer handling of storm overflow by remote control are currently being implemented at the new Syracuse facility. (Geiger-FRC)

WASTE WATER FRACTIONS ADD TO TOTAL TREATMENT PICTURE,
Water and Pollution Control Dept. Saskatoon (Saskatchewan).
R. Munch, C. P. Hwang, and T. H. Lackie.
Water and Sewage Works, Vol 127, No 12, p 49, 50, 53, 54, December, 1980. 7 Fig, 4 Tab, 11 Ref.

Descriptors: *Waste water treatment, *Sewage treatment, Saskatoon, Saskatchewan, Colloids, Phosphorus, Nitrogen, Grease, Metals, Canada.

Composition of raw sewage influent at the Saskatoon, Saskatchewan, treatment plant was determined by sampling during February, May, and October in order to obtain information for advanced treatment design. These results were compared with analyses of primary and secondary effluent and with raw sewage data from other cities. The composition of total and volatile solids was uniform throughout 1978; only the quantity changed. Saskatoon primary effluent contained 87% soluble solids, requiring maximum organic removal to be directed toward that fraction. Grease discharged from meat packing industries appears in the supra-colloidal fraction (83%). Grease removal after secondary treatment (using a rotating biological contractor) was about 88%. Distribution of organic nitrogen before and after primary treatment showed that nearly all removal occurred in the settleable and supra-colloidal fractions. Secondary treatment removed organic nitrogen from the supra-colloidal and soluble fractions. Overall removal of organic nitrogen was 74%. Phosphorus removal was accomplished during separation of the settleable fraction (22% of raw sewage). Secondary effluent contained 93% of the soluble phosphorus. BOD, COD, and total organic carbon studies produced inconclusive results. Copper and chromium were entirely within the settleable fraction. Zinc appeared in the supra-colloidal fraction and was not removed by primary or secondary treatment. (Cassar-FRC)

STATISTICAL COST FUNCTION DEVELOPED FOR SEWER LINES,
Johns Hopkins Univ., Baltimore, MD.
S. H. Hanke, and R. W. Wentworth.
Water and Sewage Works, Vol 127, No 12, p 55, December, 1980. 3 Ref.

Descriptors: *Construction costs, *Pipelines, Costs, Sewerage, Conveyance structures, Estimating, *Waste water lines, Cost analysis.

Since the average cost per unit of pipeline decreases as pipeline diameter increases, an equation has been developed to express this relationship for use in cost estimates for waste water lines. This formula relates total costs to pipeline diameter, flow rate, and several constants. For example, if pipeline capacity is increased by 100%, it is 95% certain that construction costs will increase by 36-39%. (Cassar-FRC)

MODELLING THE DYNAMICS OF THE ACTIVATED SLUDGE WASTE WATER TREATMENT PROCESS IN TERMS OF THE CARBON VARIABLE,
Ugine-Kuhlmann, Pierre-Benite (France).
S. Perdrieux, and N. Therien.
Water Research, Vol 14, No 9, p 1333-1344, September, 1980. 16 Fig, 2 Tab, 19 Ref.

Descriptors: *Waste water treatment, *Activated sludge, *Mathematical models, Carbon, Organic compounds, Kinetics, Suspended solids, Biodegradation, Microorganisms, Biochemical oxygen demand, Sludge.

Carbon as a process variable was used to characterize the dynamic nature of the activated sludge process in terms of the soluble organic carbon for the substrate and the suspended solid organic carbon for the biomass. Intermediate carbon compounds stored in the cells were also considered in the mathematical models developed by the authors. This model utilized the concentration of organic substrate, the concentration of cellular material, and the concentration of products stocked in the cells for the aeration unit of the activated sludge process. The substrate and biomass concentrations predicted by this model are compared to simpler models based on the growth kinetic concept using Monod or two-phase expressions and to earlier work performed by the authors. The failure of the Monod model to predict some important aspects of the unsteady state operation is discussed. (McKeon-FRC)

THE ROLE OF THE COBALT CATALYST IN THE UNSTEADY-STATE TEST,
Simon-Hartley Ltd., Stoke-on Trent (England).
W. S. Robertson.
Water Pollution Control, Vol 79, No 4, p 487-495, November, 1980. 4 Fig, 1 Tab, 11 Ref.

Descriptors: *Aeration, *Unsteady state test, Cobalt, Copper, Dissolved oxygen analyzers, Oxygenation, Analytical techniques, Testing procedures, Equipment, Evaluation.

The unsteady-state test, used in testing aeration equipment, exhibits non-reproducible results. Preliminary comparisons with several methods of deoxygenation and dissolved oxygen measuring methods indicated that chemical interference was probably the cause of discrepancies. Tests with copper sulfite catalyst showed that it was suitable for the sulfite oxidation method, but not for the unsteady-state test. Tests with cobalt chloride showed the reverse situation. Chemical interference was absent at 5C, but more important at 15C and above. The cobalt catalyst appeared to be complexed and present as a precipitate, taking part in reactions and having a relatively high oxygen demand. However, its rate of reaction was slow and unpredictable, being affected by water composition and temperature. (Cassar-FRC)

UNUSUAL BEHAVIOUR OF CILIATED PROTOZOA IN A SECONDARY SETTLEMENT TANK,
Yorkshire Water Authority (England). Southwestern Div.
G. Wheale, and D. J. Williamson.
Water Pollution Control, Vol 79, No 4, p 496-500, November, 1980. 6 Fig, 4 Tab, 4 Ref.

Descriptors: *Activated sludge, *Protozoa, *Water pollution sources, Halifax(England), Effluents, *Waste water treatment, Sludge treatment.

During a period of high solids loading in the Halifax, Yorkshire, treatment plant, unusual white streaks (maximum size, 3 meters by 1 meter) were observed resting on the sludge blanket in a secondary settlement tank. This material was composed of large flocs about 1 mm diameter. Microscopic examination revealed that these flocs were spherical colonies of a peritrich similar to Carchesium polypinum. However, this species had faintly striated pellicles and clearly segmented stalks, different characteristics from those of Carchesium polypinum. Rotifers were also seen. Addition of a synthetic cationic polymer to assist settlement caused a release of flocculated colonies to the surface of the tank. The detached colonies may comprise a major proportion of the suspended solids in effluent from this plant. (Cassar-FRC)

ANAEROBIC CONTACT FILTER PROCESS: A SUITABLE METHOD FOR THE TREATMENT OF VEGETABLE TANNING EFFLUENTS,
National Environmental Engineering Research Inst., Kanpur (India). Zonal Lab.
H. C. Arora, and S. N. Chattopadhya.
Water Pollution Control, Vol 79, No 4, p 501-506, November, 1980. 2 Fig, 2 Tab, 3 Ref.

Descriptors: *Filtration, *Tannery wastes, *Anaerobic digestion, Industrial wastes, Chemical wastes, *Waste water treatment, Sludge digestion, Contact filter process.

An anaerobic contact filter process was further tested as a method of treating vegetable tanning effluents. Batch feeding simulated actual operating conditions in local tanneries. Retention periods varied from 12 hours to 144 hours. The influent was a mixture of liming liquor, exhaust tan liquor, and deliming liquor. In the initial stages there was

a progressive increase in precentage removal of COD to a maximum of 80-90%, which leveled off after 54 days (retention period 144 hours). However, when retention times were reduced to 48 hours on Filter I and 24 hours on Filter II, pollutant removal decreased initially, and gradually increased over a 2-week period to the 80-90% steady state. BOD and tanning levels behaved similarly. Subsequent reductions in retention time (to 24 hours for Filter I and 12 hours for Filter II) did not significantly affect removal of organic materials. Advantages over the conventional lagooning systems are smaller land area, smaller capital costs, no sludge disposal necessary, and production of a usable combustible gas. (Cassar-FRC)
W81-01359

THE USE OF ULTRA HIGH RATE DUAL-MEDIUM FILTRATION AND DISSOLVED-AIR FLOTATION FOR MAINTENANCE OF CONSISTENT EFFLUENT STANDARDS AT HIGH LOADINGS,
Water Pollution Research Lab., Stevenage (England).
P. H. Jago, J. A. Ovens, and P. E. Hale.
Water Pollution Control, Vol 79, No 4, p 442-451, November, 1980. 4 Fig, 3 Tab, 7 Ref.

Descriptors: *Filtration, *Flotation, Dissolved air flotation, Suspended solids, Waste water treatment, *Sewage treatment, Separation techniques.

Dissolved-air flotation and ultra high rate dual media filtration (sand, anthracite) are processes which can maintain effluent quality from secondary settlement tanks during periods of sudden increases in flow of sewage to the plant. These two pilot plant systems were operated in parallel from August, 1977, to June, 1978, at the Fengate sewage treatment works in a comparison study. The dissolved-air flotation process produced a final effluent containing not more than 30 mg per liter suspended solids from a secondary settlement tank effluent containing up to 550 ml per liter. The filter, unable to handle these high loads, could produce satisfactory effluent from influent levels up to 150 mg per liter at a flow of 6.5 mm per second and 200 mg per liter at 3.25 mm per second. The pilot plant filter required frequent backwashing, but remained clear of biological growth. (Cassar-FRC)
W81-01360

USE OF WATER HYACINTHS IN WASTE WATER TREATMENT,
Maryland Univ., Eastern Shore, Princess Anne.
G. C. Gupta.
Journal of Environmental Health, Vol 43, No 2, p 80-82, September/October, 1980. 30 Ref.

Descriptors: *Water hyacinth, *Waste water treatment, *Reviews, Publications, Coliforms, Sewage, Biochemical oxygen demand, Nitrogen, Phosphorus.

A literature review is presented on the use of water hyacinths in sewage and waste water treatment. Water hyacinths have been effective in removing algae, fecal coliforms, suspended particles, trace toxic metals, organics, and many other dissolved impurities from waste water. Water hyacinths are classified as an aquatic pest, but culturing hyacinths in a sewage lagoon system can reduce BOD5 up to 95%, total suspended solids up to 90%, and also reduce nitrogen, phosphorus, heavy metals, and pesticides. Biological, chemical, and physical factors combine to remove contamination. Five point one acres of water hyacinths are needed for 1 mgd throughput to remove 80% of the nitrogen and 44% of the phosphorus. Hyacinths are effective and cheap where land is available inexpensively. (Small-FRC)

TOWNSHIP OF TEMAGAMI: ONE ALTERNATIVE FOR SERVICING A NORTHERN COMMUNITY,
Ontario Ministry of the Environment, Toronto.
B. J. Cooper.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 140-149. 1 Tab, 3 Ref.

Descriptors: *Pressure sewers, *Ontario, *Cold regions, *Sewage disposal, Environmental sanitation, Sewage lagoons, *Sewage treatment, Sewers, Canada, Pipes, Public utilities, Cost analysis, Cost comparisons, Operating costs.

A low pressure, shallow buried, thermally insulated pressure sewer system was constructed to correct the serious environmental and public health problems at the Township of Temagami. Temagami, which is located approximately 460 km north of Toronto, has approximately 150 dwellings. The combination of 1300 freezing degree days Celsius and the location of the community on the Precambrian Shield resulted in very expensive servicing. Since most of the capital costs of construction were subsidized, the system with the cheapest operating cost per annum was used. The sewer system was composed of a styrofoam 'frost box' with the transmission main located in the box and buried only to a typical depth of 1.2 m. The final system involved 8,250 m of pipe, 30 valve chambers, a heat tracing system, 160 pumping units, and home service connections. A waste stabilization pond was constructed at a cost of approximately $304,000/ha and was designed for a 180 day retention period. From the pond, effluents are treated for phosphorus removal and then are discharged into the lake. Cost comparisons of this system and three more conventional systems are given along with a list of factors for consideration in the evaluation of pressure sewers versus gravity sewers. (See also W81-01381) (Seigler-IPA)

MODIFIED LOW PRESSURE COMMUNAL SEWAGE DISPOSAL SYSTEMS,
Sturgeon Health Unit, St. Albert (Alberta).
K. W. McAmmond.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 477-483. 3 Fig.

Descriptors: *Sewage disposal, *Alberta, *Sewage effluents, *Septic tanks, Sewage sludge, Sewage lagoons, Sanitary engineering, Liquid wastes, Rural areas, Sewage treatment, Environmental sanitation, Water pollution sources, Plastic pipes, Pumping.

A modified collection system using plastic pipe and a small lagoon is recommended as an alternative to present ineffective sewage disposal systems in Alberta. This modified low pressure communal sewage disposal system disposes of liquid effluent in a safe and reasonably economical manner for hamlets, suburban, and rural residential areas. The system uses septic tanks, automatically controlled sewage pumps, and plastic pipes. Raw sewage flows by gravity into a two compartment septic tank at each home where the liquid separates from the solid and the liquid flows into the second compartment. The liquid is then pumped through a plastic pipe into collector mains that convey the liquid to a lagoon located outside of the community. The sewage pumps are automatically activated by the liquid level in the septic tank. A checkvalve prevents backflow from the main. No problems with blockage or plugging have occurred where this system has been installed; the septic tanks are pumped out every second year. System benefits include protection from diseases, safe disposal of ground seepage water, increased real estate values, increased tax revenues through growth and higher assessments, safety for wells, and lowering of the water table that can eliminate the need for basement sump pumps. A recent cost estimate from the Hamlet of Busby, where there are 30 connections, is $110,900. (See also W81-01381) (Seigler-IPA)
W81-01409

THE TREATMENT OF WOOLSCOUR EFFLUENT - I. REMOVAL OF COLLOIDAL DIRT,
Department of Scientific and Industrial Research, Petone (New Zealand). Industrial Processing Div.
C. N. S. McLachlan, D. K. W. Smith, and R. J. Webb.
Water Research, Vol 14, No 7, p 729-733, July, 1980. 8 Fig, 2 Tab, 10 Ref.

Descriptors: *Wool grease, *Industrial waste, *Waste water treatment, *Flocculation, Polyelectrolyte, Flotation, Pilot plants, Centrifuge, Sludge, Sedimentation.

Removal efficiencies of colloidal dirt in woolscour effluent were studied using polymeric flocculants, dissolved-air flotation and sedimentation. The effectiveness of the polymers was tested in both laboratory and fullscale experiments. Results indicated that up to 80% of the dirt in the liquor was removed as a 20% weight to volume ratio solids sludge. This sludge was capable of further dewatering to 45-50% solids using a solid bowl centrifuge. There was no evidence of dirt re-deposition on the wool as a result of the use of the polyelectrolyte, nor was the use of the polyelectrolyte found to have a measurable effect on centrifugal grease recovery. A comparison of the results obtained using the settling tank and the flotation tank indicated that under normal circumstances a suitably designed settling tank provided the simplest method of solids removal when readily settlable solids and colloidal material were removed together. (McKeon-FRC)
W81-01413

THE TREATMENT OF WOOLSCOUR EFFLUENT-II. GREASE REMOVAL BY ALCOHOL EXTRACTION,
Department of Scientific and Industrial Research, Peton (New Zealand). Industrial Processing Div.
C. N. S. McLachlan, D. K. W. Smith, and R. B. Fieldes.
Water Research, Vol 14, No 7, p 735-740, July, 1980. 6 Fig, 5 Tab, 15 Ref.

Descriptors: *Solvent extraction, *Wool grease, Separation techniques, Industrial wastes, Waste water treatment, *Alcohols, Oily water, Flocculation, Polyelectrolytes, Biochemical oxygen demand, Pilot plant.

The use of pentanol in combination with a flocculant to crack a woolgrease-in-water emulsion and the subsequent separation and recovery of grease from the remaining colloidal dirt are described. The addition of 4-5% pentanol together with a synthetic polymer, Magnafloc 455, enabled a rapid separation of the de-emulsified grease and dirt from the liquor. The grease is then separated from the colloidal dirt, followed by steam stripping of the effluent streams to recover the pentanol. Grease removals from the liquor averaged 85-95% and BOD reductions averaged 50-75% in both laboratory and pilot scale trials. An effluent free of suspended solids and readily amenable to biological treatment was produced. (McKeon-FRC)
W81-01414

SEPARATING SOLIDS FROM LIQUIDS,
Courtaulds Ltd., London (England). (Assignee).
D. C. Woodward.
U.S. Patent No 4,197,180, 6 p, 4 Fig, 3 Ref; Official Gazette of the United States Patent Office, Vol 993, No 2, p 616-617, April 8, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Separation techniques, Water purification, Electrolysis, Electrodes, Carbon, Bubbles, Activated sludge, Equipment, Electroflotation.

In a process for the separation of solid particles from an aqueous liquid by electroflotation various effluent liquids can be clarified, surplus activated sludge can be concentration and protein can be recovered. The apparatus for carrying out the separation comprises a tank containing an anode and a cathode, at least one of these electrodes being formed from carbon fibres. The tank has an inlet for the aqueous liquid containing solid particles and an outlet for clarified liquid and means for removing solid particles which have been carried upwardly in the tank. The electrodes preferably comprise carbon fibres set in an electrically-insulating matrix and having exposed ends of carbon

fibres substantially throughout the length of the electrode. (Sinha-OEIS)
W81-01419

METHOD FOR MINIMIZING THE ORGANIC WASTES IN AQUEOUS PRODUCT STREAMS PRODUCED IN LIQUID-LIQUID EXTRACTION PROCESSES,
Kernforschungszentrum Karlsruhe G.m.b.H. (Germany, F.R.). (Assignee).
W. Ochsenfeld, and J. Schon.
U.S. Patent No 4,197,195, 6 p, 7 Ref; Official Gazette of the United States Patent Office, Vol 993, No 2, p 621, April 8, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Separation techniques, Organic wastes, Absorption, Resins, Recycling, Distillation, Regenerating solvent, Regeneration.

A method is provided for minimizing the organic waste found in an aqueous process stream of products and refined products from a liquid-liquid extraction process. The aqueous process stream contains small quantities of interfering substances in the form of an organic extraction agent and decomposition products of the extraction agent and is treated with an agent which selectively, practically quantitatively and reversibly sorbs the interfering substances. This agent is a macroporous sorption resin based on polystyrene cross-linked with divinyl benzene. The sorption resin, after being charged with the interfering substances, is regenerated by being brought into contact with a regenerating solvent. The regenerating solvent is then separated from the sorption resin and subjected to a distillation. The distillate consists of pure solvent and is put back into circulation to regenerate sorption resin. The extraction agent obtained as the distillation residue is recirculated, after dilution with a dissolving diluent, and returned into circulation in the extraction process. (Sinha-OEIS)
W81-01420

SHIPBOARD BLACKWATER PHYSICAL/CHEMICAL TREATMENT SYSTEM,
Office of the Secretary of the (Navy). Washington, D.C. (Assignee).
C. S. Alig.
U.S. Patent No 4,197,200, 5 p, 1 Fig, 9 Ref; Official Gazette of the United States Patent Office, Vol 992, No 2, p 622, April 8, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Water purification, Separation techniques, Disinfection, Ozone, Equipment, Incineration, Boats, Water supply, Shipboard systems.

An automatic dual-mode shipboard waste water treatment system employs ozone for disinfection of the primary effluent. Solids are removed and pumped to the ship's boiler or other equipment for incineration, while the liquid waste is pumped through a series of ozone reactors and then to a holding tank from which it is discharged overboard, after accumulating to a predetermined level. The system operates continuously by recirculating the effluent, during low flow periods, between a second holding tank and the ozone reactors. (Sinha-OEIS)
W81-01422

BIOLOGICAL SEWAGE TREATMENT PLANT,
Przedsiebiorstwo Instalacjiprzemyslowych, Katowice (Poland). (Assignee).
R. Przybylowicz, L. Narbutt, and J. Stepien.
U.S. Patent No 4,197,202, 7 p, 11 Fig, 17 Ref; Official Gazette of the United States Patent Office, Vol 993, No 2, p 623, April 8, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Sewage treatment, *Biological treatment, Equipment, Aeration, Flow, Absorption, Microorganisms, Oxygen.

A multi-stage biological sewage treatment plant includes a tank of cylindrical shape, divided concentrically by means of vertical annular stationary screens, forming chambers, and by means of movable annular screens forming sections performing various technological functions. Floats located in the walls of the movable screens ensure aeration of the liquid with gas. Regular aeration and mixing of the whole contents of liquid in the chambers ensure an optimication of hydraulic parameters and for maintaining the whole mass contained in the chamber in a state of suspension. This enables absorption of impurities contained in the sewage by the cell mass of microorganisms being the active sediment, whereas the factor stimulating the growth of microorganisms is the amount of oxygen fed by the aerating devices. (Sinha-OEIS)

WATER RECYCLING WITH SOLIDS AND FOAM REMOVAL,
The Water-Cyk Corp., Vienna, VA. (Assignee).
E. P. Toms.
U.S. Patent No 4,197,597, 9 p, 11 Fig, 6 Ref; Official Gazette of the United States Patent Office, Vol 993, No 3, p 754, April 15, 1980.

Descriptors: *Patents, *Waste water treatment, *Domestic wastes, *Water reuse, Separation techniques, Filtration, Equipment, Hydraulics.

A water economizing system for new or existing buildings is described where the waste lines of lavatory sinks, showers and clothes washing machines are connected to a storage reservoir for the accumulation of the water. This accumulated water is filtered and treated and then used for the operation of water closets of toilets. The storage reservoir provides for the removal of solids and foam by flushing action at the top and subsequently for the gravitational separation of solids which are periodically flushed from the bottom of the reservoir into the sewer. The pumping action which delivers the accumulated water to the water closets of toilets may be hydraulically operated by a portion of the water drained to the storage reservoir. (Sinha-OEIS)

5E. Ultimate Disposal Of Wastes

DISPERSION AND WEATHERING OF CHEMICALLY TREATED CRUDE OILS ON THE OCEAN,
Chevron Oil Field Research Co., La Habra, CA.
C. D. McAuliffe, J. C. Johnson, S. H. Greene, G. P. Canevari, and T. D. Searl.
Environmental Science and Technology, Vol 14, No 12, p 1509-1518, December, 1980. 7 Fig, 5 Tab, 16 Ref.

Descriptors: *Dispersion, *Oil spills, *Water pollution control, Oily water, Surface waters, Oceans, Atlantic Ocean, Oil pollution, Oil wastes, Water pollution, Disasters, Water pollution sources, Control systems, Weathering, Emulsions.

Means to control oil spills were tested off New Jersey, at four experimental spills using Murban and La Rose crude oils. Immediately after the spill was made, two slicks were sprayed aerially with a self-mix dispersant from a pod and spray booms mounted above the skis of a helicopter. The other two slicks were sprayed similarly 2 hr after the spills were made. At 20-60 min after dispersion, the average total oil under the immediately treated slicks at 1, 3, 6, and 9 m were 0.7, 0.7, 0.3, and 0.2 mg/L for La Rose crude and 3.1, 2.4, 0.5, and 0.4 mg/L for Murban crude. At 20-45 min after treatment the highest concentrations were 3 mg/L for La Rose and 18 mg/L for Murban. In those spills treated 2 hr after spill the concentrations of oil were only slightly higher. Visual and photographic evidence indicated that Murban crude oil treated immediately was almost completely dispersed. For La Rose, immediate treatment resulted in about half the oil being immediately dispersed. Oil removed from the influence of wind by emulsification will not travel as far, and this will reduce the likelihood of oil stranding or entering biologically sensitive areas. Murban crude dispersion weathered more rapidly than La Rose, reflecting Murban's lower viscosity and perhaps its smaller droplet sizes. (Baker-FRC)

Under the Resource Conservation and Recovery Act (RCRA) of 1976 stringent regulations were imposed on the disposal of toxic wastes. The two types of wastes to be regulated under the RCRA were identified by their characteristics of ignitability, corrosivity, reactivity, and extraction procedure toxicity or by non-specific source listings. Waterborne and air emission wastes are regulated under the Clean Water Act, Clean Air Act and Safe Drinking Water Act. Chemical treatment is often employed for handling heavy metals, acids and alkalies, cyanide and other noxious gases. In the United States, the burden of waste treatment rests with the waste generator, while in Europe many government-owned facilities are operated for the treatment of hazardous wastes. After wastes are treated, ultimate disposal of wastes can take place at landfills or by incineration. Hazardous wastes landfills are engineered to avoid contamination of groundwater through leaching. Some landfills are covered with special liners, which are resistant to rodent and root penetration and which help contain toxic wastes. Leachate collection must be monitored, and other precautions are taken to secure the landfill. Centralized stations exist in Europe for the collection and disposal of paint wastes, oils and other toxic substances. Some costs of toxic waste treatment and disposal, as well as response of industry in attempting to recycle wastes and minimize this economic burden are discussed. (Geiger-FRC)

ANAEROBIC SLUDGE DIGESTION PROCESS WITH PROLONGED DIGESTION TIME FOR THE SOLID SUBSTANCES AND SHORTENED FOR THE SLUDGE LIQUOR,
Complex Research and Design Inst. for Communal Economy, Sofia (Bulgaria).
Ch. Dimovski.
Progress in Water Technology, Vol 12, No 3, 307-313, 1980. 1 Fig, 2 Ref.

Descriptors: *Anaerobic digestion, *Sludge treatment, *Wastewater treatment, Sludge digestion, Separation techniques, Settling basins, Aeration, Specifications.

A system for anaerobic sludge digestion which consists of a homogeneous digester and a sludge liquor separator was developed after laboratory and pilot studies. It works in a manner similar to an activated sludge system, as it utilizes aeration and settling tanks. The sludge is passed through the separator, and the solids are returned to the digester. Thus, the digestion time for the solids is lengthened. Since the liquor is separated quickly, its digestion time is shortened. The system is described, and formulas are provided for estimating technological parameters of the system, including: digester and separator capacities, average digestion time for solid substances and sludge liquor, quantity of discharged digested sludge and sludge liquor, and return sludge volume. The overall capacity of the system is 60-70% smaller than that of single stage digesters without sludge liquor separation, and 30-40% smaller than those of two-stage digesters. (Small-FRC)

DESIGN DATA FOR GRAVITY THICKENERS,
Water Pollution Lab., Stevenage (England).
M. J. D. White, C. F. Lockyear, and E. J. Tomlinson.
Progress in Water Technology, Vol 12, No 3, p

279-285, 1980. 5 Fig, 1 Tab, 1 Ref.

Descriptors: *Sludge treatment, Dewatering, Gravity, *Centrifugation, Analytical techniques, Estimating, Gravity thickeners, Thickenability, Design data.

A rapid test of thickenability was developed as method of characterizing sludge and as an aid in the design of full-scale thickeners. In this rapid test, a low-speed centrifuge is used to simulate the compressive effect of a deep sludge blanket. The compressibility of the sludge is determined by varying the centrifugal acceleration from 5 to 100 g. Thus, the effect of the blanket depth on the ultimate concentration of solids achievable in a full-scale thickener can be estimated. A built-in stroboscope is used to determine rate of thickening. Comparisons of predicted solids concentrations with those achieved in full-scale thickeners showed good agreement. The centrifuge predicted slightly higher concentrations, which can be explained by the fact that the sludge in the full-scale thickeners had not reached its ultimate solids concentration. (Small-FRC)

EVOLUTION OF PRIMARY SLUDGE DURING THICKENING,
Paris-6 Univ. (France). Lab. de Geodynamique.
F. Abosamra.
Progress in Water Technology, Vol 12, No 3, p 297-305, 1980. 15 Fig.

Descriptors: *Sludge treatment, *Fermentation, *Anaerobic bacteria, Microorganisms, Dewatering, Confined water, Compressibility.

Three types of sludge from waste water treatment plants were thickened for seven days in a gravity thickener. Intense fermentation took place the first day, and BOD, COD, ammonia, and volatile acids increased quickly. The bacteria and protozoa in the sludge form the substrate for anaerobic acidifying bacteria which use fresh sludge particles. The conjunction of the two substrates stimulates the development of the bacterial biomass. The fermentation changes the compressibility of the sludge because of the development of a thin layer of bacteria on the surface which retains free water. Thus, fermentation changes the filterability and dewaterability of the sludge. The lime-ferric chloride and polyelectrolyte demand of the sludges increased with fermentation. (Small-FRC)

COMPARATIVE INVESTIGATIONS OF DIFFERENT METHODS TO CONCENTRATE WASTE ACTIVATED SLUDGE,
Authority for Waste Water, Hanover (Germany, F.R.).
D. Kansy.
Progress in Water Technology, Vol 12, No 3, p 287-296, 1980. 6 Fig, 7 Tab, 8 Ref.

Descriptors: *Sludge treatment, Dewatering, *Separation techniques, *Activated sludge, Flotation, Gravity, On-site investigations, Evaluation, Gravity thickeners, Decanters, Dissolved air flotation.

Gravity thickening, dissolved air flotation, nozzle-type separators, and decanters were compared as methods to concentrate waste activated sludge. At the Hannover-Herrenhausen plant, the four methods were used in parallel for activated sludge with different sludge loading rates. Flotation or nozzle-type separation concentrated the sludge to 3-6%. Gravity thickening to 2.5-4% was possible with high loaded sludges only. Decanters concentrated to 8-15%. A good quality of clarified effluent (0.01-0.05%) was reached upon thickening by flotation, but effluent quality was poorer (0.10-0.20%) with nozzle-type separation. Decanters reached effluent values of 0.05-0.15% depending on the quality of the polymer used. Nozzle-type separation had the highest energy costs and the highest stress on the flocs. Centrifuges did not reduce the quality of the effluent. (Small-FRC)

LOW COST OF PROVISION OF ANAEROBIC DIGESTION,
Severn-Trent Water Authority, Birmingham (England).
G. P. Noone, and C. E. Brade.
Progress in Water Technology, Vol 12, No 3, p 315-329, 1980. 5 Fig, 2 Tab, 12 Ref.

Descriptors: *Anaerobic digestion, *Costs, Heating, Surveys, On-site tests, Design, Performance, Uprating, *Sewage sludge, Sludge treatment, Sludge disposal.

A survey was carried out to examine the significant variations in apparent design and operation of some existing Severn-Trent Water Authority digesters. These results, combined with literature information on pilot and full-scale plant operation, indicate that uprating of an existing plant should be the cheapest method of providing additional treatment capacity. When mixing and heating are adequate, there is increased reliability of digestion at a high rate. At the Sutton-in-Ashfield site, a digester of nominal volume 1373 cu m and conventional design was modified to provide a standby gas compressor. There has been an increase in solids loading and a reduction in detention time. At Shirebrook, one of three 400 cu m tanks was converted into a heated primary digester at a cost of $29,000. Although results are preliminary at Shirebrook, increased anaerobic digestion is possible by uprating existing plants, perhaps utilizing existing tanks. The new digestion plant should be on the basis of smaller volumetric provision of the primary reactor related to examination of the whole sludge flow sheet both prior to and post primary digestion. USE OF MATHEMATICAL MODELS TO DERIVE A SYSTEM FOR CALCULATING THE ACCEPTANCE CAPACITY OF MARINE COASTAL WATERS. (UTILISATION DE MODELES MATHEMATIQUES DANS LA MISE AU POINT D'UNE METHODOLOGIE DE CALCUL DE LA CAPACITE D'ACCEPTATION DU MILIEU RECEPTEUR LITTORAL MARIN.),
Ingenieur General des Ponts et Chaussees, Grenoble (France).
M. de Rouville, G. Chevereau, and B. Quetin.
Progress in Water Technology, Vol 12, No 1, p 279-300, 1980. 6 Fig, 16 Ref.

Descriptors: *Methodology, *Diffusion, *Municipal wastes, Ocean currents, Oceans, Jets, Flow, Convection, Water pollution effects, Mediterranean, Mathematical models, Waste water disposal, *Sewage disposal.

A universal methodology is established to determine the dispersion of urban sewage discharged into marine coastal waters. Three separate programs are employed, which make it possible to simulate the essential phenomena of marine diffusion effluents: the changes in form of jets and plumes discharged in the presence of a thermal stratification, the latter being simulated based on meteorologic data; changes in effluent entrained by a surface current (convection, spreading, lateral and vertical diffusion), and bacterial autopurification. The use of this methodology in studies on the French Mediterranean is discussed, and case histories are presented. The model can be used to determine the effect of a particular discharge, and also to determine the capacity of the coastal waters to absorb polluting discharges. (Small-FRC)

MOVEMENT OF CHLORIDE IN A SOIL WITH VARIABLE CHARGE PROPERTIES: I. CHLORIDE SYSTEMS,
Sydney Univ. (Australia). Dept. of Soil Science.
K. Y. Chan, H. R. Geering, and B. G. Davey.
Journal of Environmental Quality, Vol 9, No 4, p 579-582, October/December, 1980. 3 Fig, 3 Tab, 19 Ref.

Descriptors: *Soil chemical properties, *Chlorides, *Leaching, Leachate, *Landfills, Hydrogen ion concentration, Adsorption, Movement, Model studies, Laboratory tests, Kinetics, Cation exchange, Neutralization, Anion adsorption, Ammonia, Path of pollutants.

Chloride solutions synthesized to simulate leachate of a treated sanitary landfill were run through columns filled with xanthic ferralsol subsoil in laboratory experiments designed to measure the movement of chloride. Chloride movement did not adhere to the miscible displacement equation or other more complicated models. The positive charge of the soil was more dependent upon pH and ionic strength of the leaching solution. When the alkaline synthetic leachate was poured through the column, the amount of positive charge was enhanced due to the greater ionic strength of the leachate relative to the soil solution. Smaller increases in positive charge were attributed to reductions in pH caused by cation exchange from the leachate front. As the alkaline leachate caused the soil pH to increase to over 9.0, the positive charge was neutralized by adsorption of hydroxide. These findings illustrate how the chloride outflow curve will deviate from theory under conditions where the positive charges of the soil are changed by the leachate solution. New kinetic models are needed to describe the alterations in the soil's charge properties induced by the solutions moving through it before more advanced theories of miscible displacement can be applied to this type of situation. (Geiger-FRC)

MOVEMENT OF CHLORIDE IN A SOIL WITH VARIABLE CHARGE PROPERTIES: II. SANITARY LANDFILL LEACHATE,
Sydney Univ. (Australia). Dept. of Soil Science.
K. Y. Chan, H. R. Geering, and B. G. Davey.
Journal of Environmental Quality, Vol 9, No 4, p 583-586, October/December, 1980. 3 Fig, 1 Tab, 13 Ref.

Descriptors: Movement, *Chloride, *Leachate, Anions, *Landfills, Waste disposal, Simulated rainfall, Soil chemical properties, Cations, Soils, Fluctuations, Ion transport, Leaching, Model studies, Hydrogen ion concentration.

The effects of a lime-treated sanitary landfill leachate on the movement of chloride through a column filled with the subsoil of a xanthic ferralsol were examined in laboratory tests. The displacement of the leachate solution in the column by distilled water was also studied to simulate the effects of rainfall upon the movement of chloride in the landfill soil. Deviations from the Nielsen-Biggar miscible displacement equation were observed when chloride movement was monitored. This was attributed to fluctuations in the level of positive charge carried by the soil caused by changes in ionic strength and pH. Analysis of the leachate showed the presence of carboxylate groups which competed with chloride anions for sites on the positively charged oxidic surfaces. Chloride was displaced at the end of the leachate treatment when distilled water was added, even though the pH was greater than 9. A net desorption of chloride of 0.69 milliequivalents/100 g was measured, showing that this anion cannot be ignored in models of salt solution movement through charged oxidic soils. (Geiger-FRC)

ENERGY CONSERVATION UNITS REPLACE OIL AT SOUTHERLY WASTE WATER TREATMENT CENTER,
Pirnie (Malcolm), Inc., White Plains, NY.
J. J. Stankunas.
Water and Sewage Works, Vol 127, No 11, p 26, 27, 56-58, November, 1980. 3 Fig, 5 Tab.

Descriptors: *Waste disposal, *Incineration, Ultimate disposal, Skimming, Cleveland, *Waste water treatment, Sewage treatment, Fuels, Disposal, Sludge disposal, Energy conservation.

Sewage skimmings (grease, oil, soap, vegetable matter), are burned as part of an energy conservation program at Cleveland's Southerly Waste Water Treatment Center. This procedure eliminates the disposal of skimmings and liquid wastes,

saving process and capital costs. Skimmings are collected, pumped to storage tanks, decanted, macerated, and heated in preparation for burning in combination with fuel oil. The skimmings-fired boiler at a steam capacity of 45,000 pounds per hour, operating 95% of the time, will produce 58% of the system's requirements and save 2.75 million gallons of fuel oil annually. The steam produced is used for sludge conditioning. Other energy conservation measures in this plant are heat pumps to transfer heat from effluent to provide heat for the 13 buildings (savings, 350,000 gallons of fuel oil annually) and energy wheels to recover heat in the building exhaust system during winter (10.3 gallons per hour savings). Heat obtained by incinerating sludge is used to make steam. Total energy savings in this project are 4.2 million gallons of No. 2 fuel oil annually. (Cassar-FRC)

FLUIDIZED-BED INCINERATION OF SEWAGE SLUDGE AT ESHER, 1976-1978,
Thames Water Authority, London (England). Southern Div.
R. Dickens, B. Wallis, and J. Arundel.
Water Pollution Control, Vol 79, No 4, p 431-441, November, 1980. 2 Fig, 4 Tab.

Descriptors: *Sludge treatment, *Incineration, Disposal, *Sludge disposal, Esher(England), Fluidized beds.

Experiences during 2-1/2 years of operating a sludge dewatering and incineration plant at Esher indicated that the fluidized-bed incinerator is reliable and easy to start up and shut down. Although this type of incinerator has a low manpower requirement, a skilled maintenance staff is necessary for efficient operation. The plant processes sludge from a city of 114,000 as well as sludge imported from neighboring communities. Sludge is dewatered in coil-filter vats, then incinerated in a reactor 9.98 meters high. This contains a fluidized, heated sand bed which breaks up sludge into small, quickly-combustible particles. Ash is removed from the effluent gas as a 3% slurry and settled in drying beds. Operational problems included corrosion of scrubber-recirculating pumps and ash transfer pumps by the ash slurry, repairs on sonic-spray equipment, decline in effluent quality, ash disposal, and noise complaints by residents. THE DEVELOPMENT OF MARINE POLLUTION CONTROL IN HONG KONG,
D. W. Mackay.
Water Pollution Control, Vol 79, No 4, p 515-518, November, 1980. 1 Fig, 9 Ref.

Descriptors: *Hong Kong, *Municipal wastes, *Water pollution sources, Sea water, Sewage disposal, Sewage effluents, Industrial waste, Water pollution effects, Water pollution control, Planning.

The status of Hong Kong's waste discharges into Victoria Harbour, efforts at marine pollution control, effects on the aquatic environment, and future plans for pollution control are described. Total BOD wastes discharged into Hong Kong waters are about 140,000 tons per year. Domestic sewage generated by the 5 million inhabitants accounts for 65% of this total; agricultural wastes from 450,000 pigs and 5 million chickens, 15%; industrial effluents, 20%. About 750 tons per year of metals are discharged into the sea. Other problems are floating rubbish, oil pollution, and silt. About 90% of the population is served by the public sewer system. Thirty-six sewage treatment plants, including 17 secondary treatment plants, are in planning or construction. Seawater monitoring is conducted to provide data for planning. Some problems exist in the aquatic environment. In certain areas dissolved oxygen is low, nutrients and many metals are unacceptably high. Pathogens are monitored at the 37 regulated bathing beaches. Results are variable, but most record values less than 1,000 coliforms per 100 ml. Although marine pollution is not yet catastrophic, expansion of population, industry, and fish culture is expected to increase the pollution load by 50% within the next decade. An Environmental Protection Advisory Committee has been established to represent industrial and environmental groups in order to draft legislation and establish objectives for pollution control which will balance the interests of all parties. EFFECT OF NITRIFICATION ON MOVEMENT OF TRACE METALS IN SOIL COLUMNS,
California Univ., Davis. Dept. of Land, Air, and Water Resources.
F-H. Chang, and F. E. Broadbent.
Journal of Environmental Quality, Vol 9, No 4, p 587-592, October/December, 1980. 5 Fig, 7 Tab, 14 Ref.

Descriptors: *Nitrification, Metals, Movement, Denitrification, *Leaching, *Path of pollutants, Sewage sludge, Leachate, Soil chemical properties, Ammonia, Nitrogen compounds, *Soil tests, Hydrogen ion concentration, Sludge treatment, Nitrogen, Neutralization, *Heavy metals, Trace elements.

Sludge-treated and untreated samples of Omni silty clay and Delhi loamy sand were tested in soil column experiments to evaluate the effect of nitrification generated protons on the mobility of trace metals. Columns were leached two or three times per week with solutions of calcium chloride, ammonium chloride or potassium chloride, and the effluents after each leaching were analyzed for pH, inorganic N, percent 15N, and the metals Cd, Cr, Cu, Mn, Pb and Zn. After several months the columns were sectioned and the vertical distributions of hydrochloric acid-extractable metals were determined. All metals except Zn were present in effluents at average concentrations below 1 ppm. Ammonium chloride and potassium chloride leachings of Delhi loamy sand yielded effluents with Zn levels slightly above 1 ppm. Movement of Mn, Zn, Cu and Cd in untreated Delhi soil was influenced by nitrification. Sludge amended soil showed a stabilizing effect on Cd and Zn movement which was attributed to the formation of organo-metal complexes. Much of the input labeled NH4-N was denitrified, as indicated by N recoveries of 14-20% in the Omni soil and 40-78% in the Delhi soil. The generation of protons during nitrification was partially offset by neutralization during denitrification. It was concluded that metal mobility was affected very little by nitrification. CHLORINE RESISTANCE OF POLIOVIRUS ISOLANTS RECOVERED FROM DRINKING WATER,
Carborundum Co., Niagara Falls, NY. Electro Minerals Div.
P. T. B. Shaffer, T. G. Metcalf, and O. J. Sproul.
Applied and Environmental Microbiology, Vol 40, No 6, p 1115-1121, December, 1980. 3 Fig, 3 Tab, 19 Ref.

Descriptors: *Viruses, *Chlorination, *Water purification, Potable water, Water treatment, Public health, Standards, Resistance, Poliovirus.

Recent laboratory studies found that poliovirus 1, strain LSc, exhibited progressively greater resistance to inactivation by chlorine after exposure to sublethal doses of chlorine. This study tested poliovirus 1 isolates recovered from finished drinking water produced by a modern, well-operated water treatment plant, to see if they exhibited a similar increase in resistance to chlorine. The tested water contained free chlorine residuals in excess of 1 mg/liter. The chlorine inactivation of purified high-titer preparations of two such isolates was compared with the inactivation behavior of two stock strains of poliovirus 1, LSc and Mahoney. The surviving fraction of isolates was two orders of magnitude greater than that of the LSc and Mahoney strains. These studies suggest that a re-evaluation of the effectiveness of present disinfection practices as well as of the proposed chlorine-turbidity standard for drinking water may be necessary. Laboratory studies with stock virus strains may not always indicate what is actually going on in treated water. (Small-FRC)

LARGE-SCALE OZONE-DE FILTRATION: AN INDUSTRY FIRST,
Hazen and Sawyer, New York.
E. A. Bryant, and D. Brailey.
Journal of the American Water Works Association, Vol 72, No 11, Part 1, p 604-611, November, 1980. 4 Fig, 4 Tab, 3 Ref.

Descriptors: *Ozone, *Filtration, *Diatomaceous earth, Water purification, *Water treatment, *New York City, Croton system, Water quality, Potable water, Separation techniques, Costs, Environmental effects, Aesthetics, Alternate planning.

New York City chose the ozone-diatomaceous earth water treatment for improving water quality in its Croton system after comparisons with the high-rate conventional treatment and direct filtration with granular media. Considerations were effectiveness of treatments in meeting present and future standards, environmental impact, and costs. The ozonation-diatomaceous earth process produces water meeting all state standards, minimizes formation of chlorinated hydrocarbons, requires fewer but more highly skilled operators, deactivates bacteria and viruses prior to filtration, adjusts to rapid changes in quality of raw water, and needs less backwash water. The major reasons for the selection of the ozone-diatomaceous earth process are 30% less capital costs, compatibility with the environment, and adaptability to expansion to comply with future regulations. Disadvantages of the process are a lack of long-term experience on large scale units and the need for increased maintenance by a skilled staff. (Cassar-FRC)

CHLOROFORM PRODUCTION FROM THE CHLORINATION OF AQUATIC HUMIC MATERIAL: THE EFFECT OF MOLECULAR WEIGHT, ENVIRONMENT AND SEASON,
Canada Centre for Inland Waters, Burlington (Ontario).
B. G. Oliver, and S. A. Visser.
Water Research, Vol 14, No 8, p 1137-1141, August, 1980. 4 Fig, 3 Tab, 20 Ref.

Descriptors: *Water treatment, *Chlorination, *Humic acids, *Fulvic acids, Seasonal, Chloroform, Trihalomethanes, Rivers, Lakes, Organic compounds, Molecular structure.

Chloroform production from the chlorination of aquatic humic and fulvic acids that had been fractionated into eight molecular weight segments by ultrafiltration is discussed. Chloroform concentration per unit weight of humic material peaked at a molecular weight between 20,000-30,000 for the fulvic acids, and decreased with increasing molecular weight above 20,000-30,000 for the humic acids. Chlorination of samples from various aqueous environments (lake, river, stream, swamp, microbial) produced only minor fluctuations in chloroform concentrations. Chlorination of samples obtained from a single environment at different seasons of the year also produced similar chloroform concentrations. The authors conclude from their

sampling that the major chloroform precursors in aquatic humic material were the low molecular weight fraction (less than 30,000) of fulvic acids. The molecular weight and high surface activity of these fractions will make them difficult to remove by standard water treatment processes. (McKeon-FRC)

PROCEEDINGS -- SECOND SYMPOSIUM ON UTILITIES DELIVERY IN NORTHERN REGIONS.
Department of the Environment, Ottawa (Ontario).
Symposium held March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980. 550 p. Ottawa.

Descriptors: *Canada, *Conferences, *Public utilities, *Water delivery, *Cold regions, Water distribution(Applied), Waste disposal, Permafrost, Snow, Environmental sanitation, Sanitary engineering, Utilities, SCLAIRCOR, Building codes, Conference structures, Computer models, Pipelines.

The approaches, techniques, and materials suitable for northern utilities delivery systems were discussed in 30 technical presentations made at the conference. The papers cover eight topic areas: utility programs, energy considerations, technology applications, fire protection in the north, operation and maintenance, heat tracing and thawing, computer applications, and case studies. Factors that have contributed to the rapid development and improvement of northern systems include an improved understanding of thermal conditions through research, improved construction materials, emphasis on design and construction control, and better technology sharing and transfer. System reliability has been improved due to the efforts of those in charge of design, construction, and evaluation. (See W81-01382 thru W81-01411) (Seigler-IPA)
W81-01381

PROGRAMMING, DESIGN AND CONSTRUCTION OF UTILITIES IN GREENLAND,
Greenland Technical Organization, Copenhagen (Denmark).
G. P. Rosendahl.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 19-43. 19 Fig.

Descriptors: *Greenland, *Utilities, *Cold regions, *Sanitary engineering, Water supply, Water delivery, Sewage, Sewerage, Solid wastes, Ultimate disposal, Fire protection, Freezing, Public health, Surface waters.

The Greenland Technical Organization, established in the 1950's by the Danish Government, is responsible for all fields of technical development work in Greenland including water supplies, sewerage, refuse disposal, and fire protection. Greenland's water supply is based solely on surface water, and due to the varying topography, water supplies for most towns involve blast ditches, tunnels, gravity lines, and pump lines. Raw water lines are generally ductile cast iron pipes with electric heating cables. Water distribution is very expensive and most single-family housing areas are supplied by tank trucks, tank houses, or draw houses. Sewer lines are also very expensive and are intended for sewage only. All Greenland towns are situated on the sea so that sewage can be dumped directly without health or aesthetic drawbacks. Solid wastes removal and disposal is provided mainly by having established well-arranged hygienic conditions around disposal facilities including provisions for burning plastic/paper bags or cleaning buckets. Greenland's well organized fire protection system includes fire brigades, fire stations, an alarm system, water supplies, and instruction and training. (See also W81-01381) (Seigler-IPA)

A WATER SUPPLY SYSTEM FOR THE WORLD'S MOST NORTHERN PERMANENT COMMUNITY,
Department of National Defence, Westwin (Manitoba).
T. M. Y. Chong, and K. T. Mattes.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 367-393. 10 Fig, 1 Tab.

Descriptors: *Canada, *Cold regions, *Water distribution(Applied), *Water delivery, Plastic pipes, Freezing, Heat tracing, Insulation, Water treatment, Chlorination, *Pipelines, Water supply, Water conveyance, Water works, SCLAIRCOR.

The Canadian Forces Station Alert, located on the northern-tip of Ellesmere Island in the Northwest Territories, is installing a new water supply system that uses heat traced insulated pipe and sound engineering principles to virtually eliminate the possibility of freeze-ups. Alert's location 830 km from the North Pole makes it the world's most northerly permanent community. Design consideration for the new water supply system included reliability of service, fire flow and storage, method of construction, ease of operation and maintenance, early warning of problems, and energy conservation. Water is continuously pumped from the interior of heat traced insulated intakes by submersible pumps in Dumbell Lake. From the pumphouse the water enters a supply line made of heat traced insulated polyethylene pipe. At the water treatment plant the water is filtered, chlorinated, heated, and stored for pumping into the double loop distribution system. Due to costs, climate extremes, and a manpower shortage, the project has been divided into phases and, as of 1978, the new water supply line, treatment plant, and double loop distribution line were completed. Only one problem has occurred since the new water supply components were put into operation showing that severe climate conditions are no longer valid excuses for an inadequate water supply system. WATERWORKS SYSTEMS, YELLOWKNIFE, NORTHWEST TERRITORIES,
Reid, Crowther and Partners Ltd., Edmonton (Alberta).
J. R. Prentice, and G. A. Srouji.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 409-425. 1 Fig.

Descriptors: *Yellowknife(NWT), *Canada, *Water works, *Cold regions, *Water distribution(Applied), Freezing, Pipelines, Pumping, Pipes, Insulation, Heat tracing, Water supply, Water delivery, Water temperature, Pumping plants.

The City of Yellowknife, the most northerly major city in the western world, is taking steps to add to, and to modify its water system to meet the City's water demands up to the year 2001. The water system takes water from the Yellowknife River and pumps it through a submarine pipeline. A series of four pumphouses then pump the water to various areas such as the Giant and Con Mines, the central business district, the school, Forrest Park subdivision, the Mattonabee and Hospital districts, the Yellowknife Correctional Center, the mobile home park, and Frame Lake South. At least one more pumphouse/reservoir system will have to be installed for the Niven Lake subdivision. Each of the pumphouse units has its own distribution system with the key elements of the overall system being pumphouses 3, 4, and 1. As much of the system as possible is underground and methods taken to prevent freezing include heating the water prior to pumping, heat traced cables, and insulated pipes. Each subsystem has its own separate control and monitoring system. As the waterworks system continues to expand, existing relay systems in the 'old' pumphouses will be converted to programmable controller systems. An advantage of Yellowknife's planning was the discovery that heating requirements per liter of water in a given section of pipe have decreased over the years due to a build-up of lost heat. (See also W81-01381) (Seigler-IPA)
W81-01406

NEW APPROACHES TO WATER AND SEWER SERVICES IN PERMAFROST AREA -- NORMAN WELLS, N.W.T.,
M. M. Dillon Ltd., Edmonton(Alberta).
W. W. Irwin.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 507-542. 15 Fig, 1 Tab.

Descriptors: *Canada, *Cold regions, *Public utilities, *Water distribution(Applied), *Sewage treatment, Plastic pipes, Maceration, Sewers, Utilidors, Waste disposal, Conveyance structures, Sanitary engineering, Water delivery, Freezing.

From 1976 through 1978 the community of Norman Wells, located about 140 km south of the Arctic Circle, carried out a program of replacement and expansion of its water distribution and sewage collection services. Prior to improvements the community was serviced by a deteriorating utilidor system that was feeling the pressure for growth due to the then imminent Mackenzie Valley Pipeline. New system concepts were designed after geotechnical contraints were identified and basic material selections were completed. High density polyethylene and steel pipes were selected for buried services and ductile iron and steel for above ground services. Existing portions of the utilidor system were incorporated wherever practical. Essential elements of the water system are a single loop circulating distribution main, pretempering facilities and pumps houses in the existing booster pumping station, and a large heated storage reservoir. The sewage system has well-graded sewer lines and improved disposal facilities. All sewage is piped to a common outfall where maceration and submerged disposal facilities release the sewage well away from the shore. Performance of the system has been in general above expectations. Total cost for the water and sewage systems when completed will be in the order of $3.5 million. (See also W81-01381) (Seigler-IPA)

STORMWATER MANAGEMENT TECHNOLOGY SYSTEMS DEMONSTRATION IN THE CITY OF ST. THOMAS.
MacLaren (James F.) Ltd., Toronto (Ontario).
Environment Canada, Canada Mortgage and Housing Corporation, Ottawa, Sewage Collection and Treatment (SCAT) Report 3, November, 1980. 212 p, 66 Fig, 26 Tab, 14 Ref, 7 Append.

Descriptors: *Storm runoff, *Water management(Applied), *Cost analysis, Technology, Urban drainage, *Water pollution soources, Computer models, *Urban runoff, Water pollution, Runoff forecasting, Canada, Storms, Storm water, Surface runoff, *Model studies, Simulation analysis, Mathematical models, Econometrics, Alternative costs, Planning, Biochemical oxygen demand, *St. Thomas(Ontario).

Advanced stormwater management techniques were used to determine cost-effective solutions to stormwater flooding and pollution problems in the City of St. Thomas. The development, use, and advantages of these techniques were reviewed, and a generalized methodology for their application to stormwater problems in other municipalities has been provided. Computer analysis and modeling techniques were used to evaluate solutions to three aspects of the drainage problem in St. Thomas: flood relief, and dry weather and wet weather pollution abatement. Dry weather problems were caused mainly by very low flow rates in the re-

ceiving water; combined sewer overflows and treatment plant by-passes were the major sources of pollution during wet weather. A priority-ranked total management program was designed for the city, composed of three cost-effective measures: (1) improved efficiency and increased frequency of street sweeping to reduce wet weather BOD loading to Kettle Creek; (2) effluent pipeline construction to Lake Erie to eliminate all dry weather effluent loadings to Kettle Creek; and (3) completion of sewer separation in combined sewer areas to eliminate basement flooding and combined sewer overflows. Estimated BOD reductions were 25, 44, and 25% for these three measures, respectively. (Zielinski-IPA)

WATER BANK PROGRAM, 1972 THROUGH SEPTEMBER 30, 1979.
Agricultural Stabilization and Conservation Service, Washington, DC. Management Services Div.
Report, February, 1980. 10 p, 4 Tab.

Descriptors: *Wildlife habitats, *Habitat improvement, *Wetlands, *Water control, Migratory birds, Waterfowl, North Dakota, South Dakota, Minnesota, Wildlife conservation, Conservation, Potholes, Erosion, *Water Bank Program.

Under the Water Bank Program, the Secretary of Agriculture is authorized to enter into 10-year agreements with landowners and operators in improtant migratory waterfowl nesting and breeding areas to preserve, restore and improve the nation's wetlands. The area placed under the program is designed to preserve and improve habitat for migratory waterfowl and other wildlife resources, to reduce runoff and soil and wind erosion, and to contribute to water control. The program is being concentrated in the pothole wetland areas of the Central and Mississippi flyways with a limited number of counties in other wetland areas of the country. From 1972 through 30 September 1979, 5,227 agreements have been carried out under the program involving a total of 590,367 acres. Of this, 162,296 acres are wetlands and 428,071 acres are adjacent areas. North Dakota, South Dakota and Minnesota had the greatest number of agreements. Payments under the program have amounted to $7,094,784. (Moore-SRC)

TEMPORARY PIPELINE AVERTS WATER QUALITY EMERGENCY.
Public Works, Vol 111, No 12, p 40-41, December, 1980. 1 Fig.

Descriptors: *Pipelines, *Farm wastes, Water pollution, Reservoirs, Water quality, Public health, Pumping, Watersheds, Water pollution sources, *Water pollution control, Hogs.

When the impounding reservoir of the Farnham, Quebec water system became polluted by a hog farm in the watershed, the Farnham treatment plant had to take rapid emergency measures to protect the public from developing skin rashes and other health problems associated with use of the contaminated water supply. Under the approval of local and provincial officials, plant authorities contracted with the Williamstown Irrigation Corporation to lay a temporary pipeline to feed the treatment facility with water supplies upstream of the reservoir and the source of pollution. The pipeline took only days to lay, and with the aid of pumps, plant capacity was brought up to the expected load of 3.6 mgd. The Tico brand pipe which was used for the emergency situation in Farnham is stocked by the Williamstown company in 30 foot lengths to supply up to 2 miles of pipeline in unexpected situations. The company has the ability to fabricate more pipeline in a short period of time when needed. The pipe was laid along the path of a railroad bed and spanned a transmission route of about 2.5 miles. INDEX TO EVALUATE LAKE RESTORATION,
Tetra Tech, Inc., Lafayette, CA.
D. B. Porcella, S. A. Peterson, and D. P. Larsen.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 106, No EE6, p 1151-1169, December, 1980.

Descriptors: *Lakes, *Water quality control, *Mathematical studies, Water quality, Model studies, Water pollution control, Limnology, Federal Water Pollution Control Act, Phosphorus, Dissolved oxygen, Nitrogen, Chlorophyll, Turbidity, Eutrophication, Aquatic plants, Aquatic algae, *Lake restoration, Evaluation.

In an ongoing project to devise methods of restoring polluted lakes and preventing the contamination of clean lakes, target variables of water quality were analyzed independently and in combinations to arrive at a Lake Evaluation Index (LEI) to facilitate comparisons of water quality of various bodies of water. The LEI was used to express the overall change in water quality that might occur as a result of restoration process. It was hoped that the LEI would allow more precise evaluations of the efficiencies of various treatment procedures on a wide variety of lakes. Some of the limnological parameters included in the LEI are total phosphorus, total nitrogen, chlorophyll, Secchi depth, dissolved oxygen, and macrophyte coverage. Lake managers using the new index will be able to monitor shifts in the LEI numbers to readily assess changes in water quality. When the LEI system was applied to two restored lakes, results showed that the index was responsive to restoration efforts that actually produced changes in lake quality. When the water improvement effects of some restoration procedures were delayed, the LEI also reflected this time lag in response. (Geiger-FRC)

METHOD FOR REMOVING OIL FILM FROM WATER SURFACE,
T. V. Abaeva, N. M. Antonova, J. K. Lukmanov, O. S. Mochalova, and I. A. Nemirovskaya.
U.S. Patent No 4,197,197, 4 p, 5 Ref; Official Gazette of the United States Patent Office, Vol 993, No 2, p 621, April 8, 1980.

Descriptors: *Patents, *Water quality control, *Water pollution treatment, *Oil pollution, Dispersants, Surfactants, Biodegradation, Chemical reactions, Petroleum.

The invention relates to a dispersant for removing petroleum and petroleum products from the surface of water basins. The dispersant comprises an aqueous solution of a surfactant, viz. a mixture of salts of phosphoric acid esters and hydroxyethylated higher aliphatic alcohols. The dispersant is a non-toxic biologically degradable compound which enables its use for the removal of petroleum and petroleum products not only from the sea surface but also from the surface of shallow and small-size closed water basins. 6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

METHODS FOR DERIVING OPTIMAL OPERATING RULES FOR MULTIPLE RESERVOIR SYSTEMS,
Cornell Univ., Ithaca, NY. Dept. of Environmental Engineering.
L. E. Johnson, D. P. Loucks, and J. R. Stedinger.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-156671, Price codes: A06 in paper copy, A01 in microfiche. Project Completion Report, December, 1980. 97 p, 37 Fig, 2 Tab, 44 Ref, 2 Append. OWRT-A-088-NY(1), 14-34-0001-0134.

Descriptors: *Reservoir operation, *Optimization, *Planning, Simulation analyses, Systems analysis, Competing uses, Linear programming, *Model studies, *Multiple-purpose reservoirs.

Using both optimzation and simulation models in an interactive manner through the use of computer graphics, an approach is discussed for defining multiple reservoir operating policies. These policies are specified in a form familiar to reservoir operators, namely zones of reservoir storage that may vary in magnitude throughout the year and which denote water to be allocated to specific uses downstream. The optimization models used to define these zones also provide estimates of the reliabilities of meeting various downstream demands from each of the storage zones. Flood storage is also considered, and all zones are simulated to further improve and evaluate the effectiveness of the multiple reservoir operating policies. Flood storage is also considered. The operation of multi-reservoir operating policies based on flood and conservation storage zones are simulated to further improve and evaluate the effectiveness of the multiple reservoir operating policies.

QUENCHING THE THIRST FOR POTABLE WATER IN ARID SAUDI ARABIA,
American Water Works Association Research Foundation, Denver, CO.
J. F. Manwaring, R. G. Lee, and J. W. Hoffbuhr.
Journal of the American Water Works Association, Vol 72, No 12, p 656-665, December, 1980. 8 Fig, 1 Tab.

Descriptors: *Water supply, *Saudi Arabia, Water shortage, Reverse osmosis, Water treatment, Water resources, Water quality control, Potable water, Water resources development, Arid lands.

The drinking water conditions in terms of quality and facilities in rural areas of Saudi Arabia were investigated along with the existing operation and maintenance programs used by the water systems and the regulatory control exercised over these systems. The poor water conditions prevalent in the rural municipalities result from environmental conditions limiting the availability of high quality source water, the explosive growth that is placing new and heavy demands on municipal water supplies, the lack of treatment facilities, and the absence of proper operating and maintenance procedures. On the other hand, the country has an extremely advanced reverse osmosis plant near the capital, emphasizing the vast contrasts in this country, which present additional problems. The lack of significant rainfall places the demand far in excess of the supply. Existing rural water supply facilities, consisting of wells, treatment plants and distribution systems, and storage facilities must advance as the country becomes more industrialized. Improvements are needed in the areas of water system information, training of personnel, monitoring, preventive maintenance, inventory, and record keeping. A practical and cost-effective approach to rectify the problems is presented. (Baker-FRC)
W81-01287

WHICH PLANT EXPANSION IS THE MOST URGENT ONE IN A RIVER SYSTEM AND HOW TO DEVELOP A PRIORITY LIST,
Ruhrverband, Essen (Germany, F.R.).
K. R. Imhoff.
Progress in Water Technology, Vol 12, No 3, p 119-122, 1980. 1 Tab, 4 Ref.

Descriptors: *Equations, *Water quality, *Feasibility, *Project planning, Effluents, Biochemical oxygen demand, Rivers, Chemical oxygen demand, Priorities, *Waste water treatment, Europe.

Three mathematical expressions are formulated and then combined to evaluate the quality of receiving water, the waste water discharge, and the feasibility of plant expansion. Effluent quality equals the average COD or BOD concentration of the effluent in dry weather in mg/liter divided by the goal or standard COD or BOD in mg/liter. Receiving water quality is calculated below the proposed discharge point at low flow and is equal to the COD or BOD at low flow in mg/liter divided by the goal or standard COD, also in mg/liter. Feasibility is calculated by relating additional load reduction to additional cost. The related additional load reduction of the specific project being considered is divided by the corresponding load to

cost ratio of a reference plant. The priority of a project can be defined as the product of the feasibility, effluent quality, and receiving water quality. (Small-FRC)
W81-01320

ANALYSIS OF PREVENTIVE SEWER MAINTENANCE PROGRAMS,
J. E. Liebeskind.
Public Works, Vol 111, No 12, p 45-48, 76, 77, December, 1980. 2 Tab.

Descriptors: *Sewers, *Repairing, *Water resources planning, Economic efficiency, Management, Coordination, Maintenance, Administration, Estimated costs, Forecasting, Budgeting, Census.

Elements of successful preventive sewer maintenance programs are identified, based on a study of six exemplary programs. Preventive maintenance programs insure the integrity of the collection system as planned, designed and constructed, and produce long-term cost savings. Effective management is the cornerstone of sewer maintenance. This includes collection of accurate records, analysis of trends, accounting, and detailed sewer mapping. Services should be provided by contract when cost-effective or when special skills are required. Surveillance, inspection, and monitoring activities provide information necessary to develop and plan operation and maintenance programs. Techniques include lamping, photography, weirs, metering, smoke testing, dye testing, and surface indicators such as depressions. The study indicates that sewer districts of all sizes can incorporate elements cited here in preventive maintenance programs. (Titus-FRC)

DEVELOPMENT OF IMPROVED WATER MANAGEMENT PRACTICES IN PAKISTAN,
Colorado State Univ., Fort Collins. Engineering Research Center.
G. V. Skogerboe, W. D. Kemper, and J. O. Reuss.
Water Supply and Management, Vol 4, No 5/6, p 299-312, 1980. 1 Fig, 26 Ref.

Descriptors: *Pakistan, *Irrigation canals, *Water management, Agricultural engineering, Water conveyance, Organizations, Training, Farm management, *Water resources development.

Since 1976 an On Farm Water Management Pilot Project has been underway in Pakistan. This work involves imprrovement of 1,500 of the country's 80,000 watercourses to reduce water losses through cleaning and lining channels, precision land leveling, and improvement of agronomic and irrigation practices. Institutional objectives of this project comprise development of a core of water management advisors, engineers, and agriculturists; a permanent research program; farmer education; a network of water users' associations, and a private enterprise for manufacturing and marketing water management equipment. The University of Agriculture at Faisalabad agreed to provide training for advisory personnel in a 4 and 1/2 month course which is 75% field work and 25% classroom work. The project will continue with a detailed evaluation of a sampling of watercourses by field examination and personal interview. After 2 and 1/2 years of activity the target number of watercourses had not been investigated. However, the farmers were highly receptive to the field teams. Training programs are producing increasing numbers of field personnel. (Cassar-FRC)

INPUT-OUTPUT MODELING FOR FACILITY LEVEL WATER PLANNING,
Catania Univ. (Italy). Ist. di Idraulica Idrologia Gestione Acque.
B. M. Reitano, and D. W. Hendricks.
Water Supply and Management, Vol 4, No 5/6, p 379-396, 1980. 10 Fig, 2 Tab, 8 Ref.

Descriptors: *Input-output analysis, *Systems analysis, *Planning, Cache La Poudre River Basin(CO), Model studies, River basins, Colorado, *Water resources development.

An input-output water transaction table for the highly complex Cache La Poudre, Colorado, water system required 1 man-year for development. Using a matrix format, it has 123 components and shows 400 water transactions. The construction of an input-output model is described, using the Cache La Poudre system as an example. This model has 9 categories (entries, exits, reservoirs, ditches, industries, etc.) with a total of 109 components (specific waterways, treatment plants, etc.). The time factor is represented by both time increment and calendar position. Line diagrams are used to define connections between components. 109 mass balance diagrams and explanatory notes provide the data base. This time-saving model presents the water system in a form easily understood by persons unfamiliar with the system. (Cassar-FRC)

A SYSTEMS APPROACH TO THE STUDY OF INTERBASIN WATER TRANSFERS: THE PARTIAL DIVERSION OF THE USSR'S NORTHERN RIVERS FLOW INTO THE VOLGA,
Soyuzgiprovodkhoz, Moscow (USSR).
N. N. Moiseev, A. S. Berezner, F. I. Ereshko, and A. V. Lotov.
Water Supply and Management, Vol 4, No 5/6, p 323-337, 1980. 2 Fig, 6 Ref.

Descriptors: *Systems analysis, *River basin development, *Inter-basin transfer, Water transfer, *Russia, Optimum development plans, Caspian Sea, Azov Sea, Transportation, Fisheries, Volga River basin, Irrigation, Agriculture, Forecasting, Planning.

A systems analysis approach to solve the problems of supplying water to southeastern European Russia is discussed. The problem is to be solved by diverting some of the runoff from northern rivers to the Volga Basin. Objectives are described in a hierarchal system, that is, certain lower level objectives must be solved before answers to the higher levels may be found. First level problems concern overall social development (examples, increases in population's living standard). The second level relates to rational use of water resources (protection of environment). The third and fourth levels concern water supply activities (examples, pollution treatment, desalinization, rainfall stimulation). Several conclusions were reached by analysis of combinations of alternatives from various groups. The Ob River should not be diverted because costs would be too high. Cessation of new irrigation activities will not solve the problems of the Caspian Sea. Present irrigation growth rates should be continued into the future. New methods of irrigation (drop, mist, subsurface) should grow at a rate not greater than 2-3% because of high capital costs. Reduction of the level of the Caspian Sea is not desirable. Restoration of fisheries in the Azov Sea can be accomplished by a dam in the Straits of Kerch. Priority should be given to hydroelectric power generation at the Volga-Kama facilities. Water transportation depth should initially remain at the standard level and later be increased. Water transfers should include 35-40 cubic km of water per year from Lake Onega and adjoining rivers. Minimal disturbances would result if water were drawn from a reservoir to be built on the Onega River estuary. These alternatives will meet the water requirements of European USSR into the distant future. (Cassar-FRC)

STOCHASTIC GENERATION OF ANNUAL STREAMFLOWS,
Monash Univ., Clayton (Australia). Dept. of Civil Engineering.
R. Srikanthan, and T. A. McMahon.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 106, No HY12, p 2011-2028, December, 1980. 5 Tab, 20 Ref.

Descriptors: *Mathematical models, *Streamflow, *Australia, Flow measurement, Annual, Reviews, Natural streams, Correlation analysis, Theoretical analysis, Variability, Streamflow forecasting, Monte Carlo method.

At present, several models exist for the generation of streamflow that are useful in planning water resources development. Some short memory models such as the Markov and ARIMA, which are autoregressive models, belong to the short memory group. Fractional Gaussian noise and broken line systems belong to the long memory models. These models and some variations on them were applied to a set of Australian streams, and an operational comparison was made. The ARIMA model was shown in a series of Monte Carlo simulations to be capable of producing data from which the lag one autocorrelation and Hurst coefficients could be estimated from the streamflow series. The ARMA model with a Box-Cox transformation, the ARMA-Markov model, and the white-Markov model did not successfully preserve the autocorrelation, while the other models examined preserved all the input parameters. Short memory models preserved the Hurst coefficient to a greater extent than the long memory models when the value of the coefficient was less than or equal to 0.65. None of the systems examined preserved the Joseph effect in the sequences generated, especially in the case of highly variable streams. (Geiger-FRC)

RURAL SCHOOLS PROTOTYPE ANALYSIS,
Construction Systems Management, Inc., Anchorage, AK.
T. W. Livingston, and N. Kjeistad.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 439-474. 9 Fig.

Descriptors: *Alaska, *Cold regions, *Schools(Education), *Facilities, Design criteria, Water supply, Design standards, Construction, Buildings, Specifications, Design data, Building codes, Environmental engineering, Secondary schools, Rural areas, Community development, Public utilities.

A resource guide was developed to aid designers, school district personnel, and State administrators in the planning and construction of the many Alaskan rural secondary schools to be built in the next few years. No overall, universally desirable design is possible as schools may range from 23 students with 2 teachers to 800 students with 30 teachers. The guide has three volumes, Volume I, Design Determinants and Options; Volume II, Methodology; and Volume III, Field Data. Alaska bush schools are not simple buildings with classrooms as in normal urban areas, rather they must be a self-sufficient community facility that operates and maintains its own utility system, in addition to providing an education program. Design determinants must consider building program determinants, environmental determinants, and site utilities determinants. Four enrollment sizes were used to provide rural schools prototype analysis. The guide provides checklists for identifying various design determinants. An example of the use of the guide is given using the design of a secondary school for the fictitious village of Kuchpu, Alaska. Facility sections and floorplans are used to illustrate school designs. (See also W81-01381) (Seigler-IPA)

WATER AND SEWER UTILITIES FOR BARROW, ALASKA,
CH2M/Hill, Anchorage, AK.
L. D. Leman.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 484-506. 7 Fig.

Group 6A—Techniques Of Planning

Descriptors: *Alaska, *Utilities, *Utilidors, *Cold regions, *Urbanization, Utiliducts, Planning, Water works, Water distribution(Applied), Community development, City planning, Sewers, Underground structures, Conveyance structures, Electrical service, Television, Telephone lines.

A detailed analysis of the utility needs and constaints of Barrow, Alaska, has lead to the recommendation of a combination of above- and below-ground utilidors to best meet the community's requirements. In the central core area, where traffic and existing structures make convenience and aesthetics important, below-ground utilidors are recommended. In areas such as Browerville, where cost is the controlling factor, above-ground portions are recommended. The study was based on the premise that a coordinated utility system can best be provided through construction of large insulated utility conduits (utilidors) to carry primary distribution and collection pipes and wire throughout the community. Smaller conduits (utiliducts) will connect the service to houses and other buildings. The utilidors will also have space for telephone, television, and electrical service lines in addition to sewer and water lines. Utilidors should be constructed of steel, ductile iron, or wood staves. Pipes should be copper, high molecular weight polyethylene, or galvanized iron. A capital cost of $52 million is estimated for the system with a monthly operating and maintenance cost per unit of $168. Final design is still pending and because the estimated $52 million project cost is beyond normal funding levels for such projects, special dispensations from several agencies may be required. (See also W81-01381) (Seigler-IPA)

6B. Evaluation Process

AN EMPIRICAL APPLICATION OF A MODEL FOR ESTIMATING THE RECREATION VALUE OF INSTREAM FLOW,
Colorado State Univ., Fort Collins. Dept. of Economics.
R. G. Walsh, R. K. Ericson, D. J. Arosteguy, and M. P. Hansen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-156614, Price codes: A05 in paper copy, A01 in microfiche. Colorado Water Resources Research Institute, Colorado State University, Completion Report No 101, October, 1980. 66 p, 7 Fig, 11 Tab, 63 Ref. OWRT-A-036-COLO(2), 14-34-0001-8006.

Descriptors: *Model studies, Estimating, *Recreation demand, *Use rates, *Water sports, Fishing, *Cost-benefit analysis, Experimental models, Research and development, Synthesis, Testing, Reasonable use, Water utilization, Water allocation(Policy), Benefits, Public benefits, Fringe benefits, Riverflow, Streams, Public access, *Rocky Mountains(CO), Colorado.

Public benefits from cold water river fishing, kayaking and rafting on the West Slope of the Colorado Rocky Mountains were assessed during the summer of 1978 using a representative sample of 206 persons interviewed at nine river sites. Willingness to pay was found to be contingent on changes in congestion and water level. Recreation benefit functions were related to several important variables, including instream flow, crowding, characteristics of participants, and management costs. Policy implications were discussed with emphasis on application of the information to water management decisions. The contingent valuation approach proved successful for valuing the public benefits for this study area. The technique appeared appropriate for valuation of a wide variety of nonmarket goods, including the effects of congestion and instream flow. Expanding fishing opportunities would provide benefits to individuals having access to western rivers due to the result of less congestion at substitute sites. Providing optimum access to 15% more miles of river would increase western fishing benefits by an average of $1.25 per user-day. Marginal analysis found maximum total benefits for kayaking/rafting during spring/early summer; but for boating/fishing, from late July through September. (Zielinski-IPA)

EFFECTS OF NATURAL GAS PRICE INCREASES ON TEXAS HIGH PLAINS IRRIGATION, 1976-2025,
Winrock International Livestock Research and Training Center, Morrilton, AR.
K. B. Young, and J. M. Coomer.
Department of Agriculture, Economics, Statistics, and Cooperatives Service, Agricultural Economic Report No 448, February, 1980. 35 p, 3 Fig, 14 Tab, 24 Ref, 1 Append.

Descriptors: *Natural gas, *Irrigation, *Grains(Crops), *Cotton, *Prices, *Texas, Farm prices, Economics, Sorghum, Wheat, Dry farming, Projections, Pumping, Operating costs, High plains(TX).

Irrigation pumping costs, irrigated acreage, cropping patterns, and annual net farm income were projected for the period 1976-2025 in a 32-county region of the Texas High Plains. Alternative price scenarios for major grain crops and natural gas were used in the projections. Grain sorghum and cotton output projections, based on a constant gas price and intermediate-level grain prices, showed a decline of 61 and 33%, respectively. Wheat output from increased dryland production rose 23%. Similarly, the rising natural gas price and intermediate-level commodity prices produced a wheat output increase of 44%, a grain sorghum decrease of 70%, and a cotton decrease of 33%. Irrigation-pumpage, when a constant natural gas price was used, declined from 5 million acre-feet in 1976 to less than 1.2 million in 2025, and estimated annual net crop income declined from $277 million to $185.5 million. Irrigation of major crops when an increasing natural gas price was used was projected to terminate in 1995, and annual net crop income to decline from $277 million to $164 million. Use of high-level grain prices as a base resulted in more intensive irrigation development for 1976 to 1990, but irrigation termination was still projected to occur at approximately the same date, 1995. The price of natural gas was the primary factor affecting the economic life of irrigation in this analysis. (Author's abstract)

AN EVALUATION OF 'A PROCEDURE FOR DESCRIBING FISH AND WILDLIFE IN PENNSYLVANIA'.
Fish and Wildlife Service, Kearneysville, WV. Eastern Energy and Land Use Team.
Task Force Report FWS/OBS-79/19-A, September, 1980. 18 p, 2 Tab.

Descriptors: *Methodology, Wildlife, *Data collections, Standards, *Ecological Distributions, *Pennsylvania, Fish, Costs, *Wildlife habitats, Distribution, Wildlife management, Information exchange, Legal aspects.

A proposed methodology for summarizing fish and wildlife species distribution and habitat data was evaluated by EELUT and outside reviewers to assess its scientific and technical acceptability and usefulness. The procedure was found to be within legal constraints and cost-effective. Ninety-one percent of all reviewers thought the procedure was an accurate, comprehensive, and useful standard method for describing fish and wildlife species; 91% also thought an information system would be useful for regulatory programs, preparing and reviewing impact assessments and statements, planning and coordination activities, land and water management programs, resource inventory and assessment, land acquisition, research, and information transfer. Data compiled using the procedure in Pennsylvania was examined and found to be 95% consistent with the coding instructions and 88% accurate, when compared to the reference sources. The species list for the Pennsylvania data base was found to be more comprehensive than other sources of species lists and compared well with other specialized lists. (Moore-SRC)

ECONOMICAL CONSIDERATIONS ON LOCAL OR CENTRALIZED WASTE WATER TREATMENT SYSTEMS,
Ruhrverband, Essen (Germany, F.R.).
G. W. Annen.
Progress in Water Technology, Vol 12, No 3, p 123-217, 1980. 4 Fig, 1 Tab.

Descriptors: *Construction costs, *Project planning, *Operating costs, Economic efficiency, *Waste water treatment, Cost analysis, Treatment facilities, Europe, Federal Republic of Germany.

Because of the tendency of operating costs to continue to increase a centralized waste water treatment facility may have advantages over decentralized systems. The construction costs of a centralized system are higher, but when the operating costs are considered, centralized sewage treatment is the most economical solution. Data on over 100 biological treatment plants of the Ruhrverband are discussed, and the exponential regression of both construction cost and operating cost with increasing population is presented. The discount method is used to give one figure for both construction and operating costs. The causes of increasing operating costs are not discussed fully, but inflation is mentioned as a factor. WATER QUALITY AND HUMAN ACTIVITIES: A MONITORING AND MODELING EFFORT IN FINLAND,
National Water Board of Finland, Helsinki.
P. Heinonen, J. Eloranta, K. Kinnunen, T. Kohonen, and K. Noukka.
Water Supply and Management, Vol 4, No 5/6, p 339-369, 1980. 11 Fig, 7 Tab, 50 Ref.

Descriptors: *Water quality, *Cost-benefit analysis, *Model studies, *Finland, Water pollution, Waste water treatment, Industrial wastes, Effluents, Planning, Lake Paijanne(Finland), World Bank, KVT project, Pollutant identification, Financing, Participating funds, Cost allocation.

The Republic of Finland initiated a research program on water pollution as a stipulation for a World Bank loan to be applied toward an industrial water protection program scheduled for 1975-1977. This program, known as the KVT project, had several concerns. Manual and automatic monitoring systems measured pollution in various streams and rivers. Literature studies of several aquatic ecological models were applied to Lake Paijanne. Cost-benefit analysis methods were developed to estimate economic efficiency of water protection programs. An effluent charge system was devised to create incentives for industries to minimize their pollution discharges. The World Bank can apply information gathered from these studies toward financing similar projects elsewhere in the world. (Cassar-FRC)

Descriptors: *Surveys, *Wild River Act, *Scenic easements, *Evaluation, *Water resources develop-

ment, Public benefits, *Surveys, Wild rivers, Scenery, Legislation, Water policy, Baseline studies, Legal aspects, Recreation, Running waters, Rivers, Easements, Public access, Natural resources, Zoning, Water resources, Benefits, Assessments, Idaho, Economic import, Agriculture, Forestry, Mining.

Statistical techniques were used to analyze the scenic easement program, as well as economic impacts on the value of agricultural, timber, and mining resources. By compiling data on these resources over time, it was possible to estimate the change in value caused by the 1968 Wild and Scenic Rivers Act. Data were collected by means of structured and unstructured interviews held with Forest Service personnel, county officials, and local industry owners and managers, and by use of structured questionnaires administered to private landowners within the river corridor. The results of the analysis showed that the classification of the Middle Fork of the Clearwater has not had any significant economic affect on any of the area's resources, except for the value of land encumbered with scenic easements. The restrictions imposed on the agricultural, timber, and mining resources have not and will not curtail their productive services or limit their growth. The least squares regression model used to estimate scenic easement payments indicated that appraisal techniques employed by the various appraisers were consistent and acceptable. (Zielinski-IPA)

A POST AUDIT EVALUATION OF METHODOLOGY FOR WILD AND SCENIC RIVER DEVELOPMENT AND MANAGEMENT, THE CLEARWATER RIVER, IDAHO: A CASE STUDY OF PUBLIC INVOLVEMENT PRACTICES,
Idaho Univ., Moscow. School of Communications.
J. K. VanLeuven.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-157125, Price codes: A06 in paper copy, A01 in microfiche. Idaho Water Resources Research Institute, University of Idaho Completion Report, August, 1980. 91 p, 33 Tab, 20 Ref, 1 Append. OWRT-C-7511(No 6233)(2), 14-34-0001-6233.

Descriptors: *Wild River Act, *Scenic easements, *Evaluation, *Water resources development, *Public benefits, *Surveys, Wild rivers, Legislation, Scenery, Water policy, Recreation, Baseline studies, Rivers, Running waters, Easements, Legal aspects, Public access, Zoning, Natural resources, Water resources, Benefits, Assessments, Idaho.

The uniqueness of the Idaho Clearwater Wild River Program, the Nation's first wild river program, was delineated from a planning standpoint. Methodologies were designed to recognize the nature of this ten-year-old program and to suggest a validity procedure for measuring the human impacts of other established water resource programs. The program covers the Clearwater Middle Fork, including the Lochsa and Selway Rivers. Three principal methodologies were used: (1) an attitude survey of 280 affected landowners and public involvement participants, designed to show any discrepancies between orginal expectations and current assessment of the program; (2) a personal value analysis to indirectly assess how members of nine affected interest groups felt their personal values/ideals have been served by the program, to provide a validity measurement; and (3) application of the 1969 and 1970 public involvement/information programs to the public involvement objectives of the U.S. Forest Service's 1977 'Inform and Involve' draft handbook. The results of this study supported the initial program efforts and recommended that additional public involvement techniques be implemented. Three formats were suggested for a new ongoing program: (1) neighborhood workshops, (2) a wild river program newsletter, and (3) an educational program for tourists, school children, and others less aware of the program. APPROPRIATE TECHNOLOGIES FOR WATER SUPPLIES AND SANITATION IN NORTHERN COMMUNITIES,
International Development Research Center, Ottawa, (Ontario). Health Sciences Div.
M. G. McGarry, T. Jackson, W. Rybczynski, A. V. Whyte, and A. P. Zimmerman.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 121-135. 1 Fig.

Descriptors: *Canada, Indian reservations, *Sanitary engineering, *Cold regions, *Sewage disposal, Environmental sanitation, Public health, Enteric bacteria, Eutrophication, Water supply, Education, Epidemics, Human diseases, Potable water.

The Big Trout Lake Indian Reserve on Post Island, west of James Bay in Northern Ontario, is an example of community participation in the design of water and sanitation facilities in Indian communities in the north. Like most Indian communities in northern Canada, the 600 Cree-speaking indigenous people of the reserve are dependent on buckets in the summer and ice block collection in the winter as a water source. A team of professionals with international development experience in water supplies and sanitation was brought in and emphasis was placed on community participation. The team found that sewage from the community would have to be contained to stop eutrophication and fecal contamination of the lake, a major water source for the community. No native houses were found to have piped water and pit latrines were used for defecation. The team recommended a dynamic process of improvements as no single technology could be uniformly applied and afforded. Water supply alternatives include catchment by roof, hand pumps, street taps or standpipes, and truck delivery. Excreta disposal alternatives include improved or lined pit latrines, moldering toilets, and a truck collection system. Big Trout Lake illustrated that how choices are made is as important as what choices are made, and community education is of high priority. (See also W81-01381) (Seigler-IPA)

INTRODUCTION TO FIRE PROTECTION IN THE NORTH,
Toronto Univ. (Ontario). Dept. of Civil Engineering.
G. W. Heinke.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 223-224.

Descriptors: *Fire protection, *Cold regions, *Northern regions, *Burning, Insurance, Protection, Risks, Cost analysis, Evaluation, Value engineering, Cost-benefit analysis.

To achieve an adequate level of fire protection and prevention in northern communities the real requirements must be examined, objectives for public and private systems must be stated, and a suitable system must be designed and maintained. Most northern communities are small and do not have the funding or management capabilities to own and operate an adequate fire system. Other factors making fire protection in the north difficult include extremely low temperatures, high winds, drifting snow, dry air, long heating seasons, community isolation, and the lack of adequate roads. There is also the problem of who mans the fire equipment, a paid or volunteer brigade. In most cases a combination is desirable. The prime requirement of any system is its readiness to serve. Another factor that must be considered is the level of protection needed to reduce insurance rates. Too often towns that do develop good systems are not rewarded with lower rates because they are too small for differential rates. (See also W81-01381) (Seigler-IPA)
W81-01392

FIRE PROTECTION IN THE NORTH,
Construction for the Government of the Northwest Territories, Yellowknife Safety Div.
L. Adrian.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 225-229. 1 Fig.

Descriptors: *Canada, *Northwest Territories, *Fire Protection, *Cold regions, Protection, Standards, Fire extinguishers, Building codes, Fire brigades, Education, Smoke detectors, Fire halls, Zoning, Organizational structure.

The Fire Prevention Ordinance of the Northwest Territories is designed to provide the best fire protection within the limits of the economic factors of the area. The Northwest Territories have many extremes since they cover approximately one third of Canada. The population of 46,000 people is scattered over this area making fire protection difficult. The Fire Marshall must record all reported fires, report annually to the Commissioner, and review building plans to ensure that they conform to standards. Building codes require at least two fire extinguishers in every home and the Yellowknife and Inuvik areas require smoke detectors in every area with sleeping quarters. The Department of Local Government purchases fire protection equipment for all settlements including hamlets; villages, towns, and cities purchase their own. Due to the varying terrain of the area, a standard for equipment is not possible. Every community has organized fire brigades that are, in general, volunteer. Fire hall complexes consist of a combined fire hall and settlement office with a two-bay garage and training facilities. Zoning codes provide for proper distances between buildings and students are trained in the use of fire extinguishers. (See also W81-01381) (Seigler-IPA)
W81-01393

FIRE PROTECTION CONSIDERATIONS IN REMOTE, COLD REGIONS COMMUNITIES,
Indian Health Service, Window Rock, AZ. Navajo Area Indian Health Service.
W. L. Ryan.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 230-233.

Descriptors: *Fire protection, *Cold regions, *Sprinklers, *Building codes, Protection, Fire extinguishers, Smoke detectors, Fire hydrants, Insurance, Cost analysis, Water distribution, Value engineering, Risks, Burning.

Fire is a major problem in cold regions and practical solutions must be used rather than relying on the standard solutions suited for more temperate areas. The great danger from fire in cold areas comes from the length and severity of the heating season, lack of adequate water distribution, high winds, and poor roads. Due to the high cost of water distribution, the fire codes and prevention standards superimposed by insurance companies are not realistic for small isolated northern communities. The primary goal of saving lives can be aided in the north by having adequate fire escapes, well marked exits, smoke alarms, and community fire alarm systems. Sprinkler systems should be installed in homes and public buildings. Other good protection measures include a faucet in the home with a garden hose attached and hand operated fire extinguishers. Fire hydrants and tank truck systems have often proved ineffective in cold regions due to the elapsed time in getting to a fire, and fire hydrants that are frozen. Several communities have novel approaches such as the use of the airport snowblower in Unalakleet, Alaska, to dump snow on burning buildings. (See also W81-01381) (Seigler-IPA)
W81-01394

FIRE PROTECTION IN ISOLATED NORTHERN COMMUNITIES,
Office of Dominion Fire Commissioner, Ottawa (Ontario).
R. G. Whatmough.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5,

October, 1980, p 234-236.

Descriptors: *Canada, *Fire protection, *Cold regions, Fire extinguishers, Burning, Protection, Building codes, Combustion, Water distribution, Sprinklers, Standards, Fire departments.

Factors affecting fire protection in northern areas include the following: a long continuous heating season, the prevalent use of combustible building materials, poor road conditions, lack of trained tradesmen for services and repairs to equipment, and the use of portable water instead of piped water. The National Building Code of Canada and the National Fire Code set standards to aid in providing fire protection for northern communities. However, the building code is based on an adequate water supply with a full-time fire department while most northern communities have a volunteer fire department and a portable water supply. Due to this, an early alerting system and a regular fire inspection program are essential. The water supply needed for fire protection is determined by building size, type of construction, occupancy classification, fire fighting response time, fire fighting capability, and exposures to building. Often the water supply to a building does not provide sufficient pressure for a sprinkler system. In this case, pressure tanks filled with water and air at all times can be used. Despite the damage that water can cause, especially when it freezes, it remains the most general, all-round efficient extinguishant for controlling structural fires. SANITATION FACILITIES OPERATION AND MAINTENANCE IN ALASKAN NATIVE VILLAGES,
Alaska Area Native Health Service, Anchorage.
D. R. Rogness.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 239-247.

Descriptors: *Alaska, *Public utilities, *Operation and maintenance, *Sanitary engineering, *Sewers, *Water works, *Reliability, Education, Management, Maintenance costs, Operations, Cold regions, Inspection, Water systems, Hydraulic structures.

For three years the Alaska Area Native Health Service has conducted a program to provide maximum support to Alaska Native villages in the operation and maintenance of their water and sewer systems. The program does not directly subsidize the operation and maintenance of a system, rather it prepares and trains the village operators and citizens so that they are able to increase the reliability of system operations. After funding but prior to design and construction, a trained team visits a village several times to explain design alternatives and the amount of maintenance required by each. The village's responsiblity for operation and maintenance is stressed. This has lead to the selection of simpler central-type facilities that are less expensive and easier to operate and maintain. During construction, village operators receive on-site training that is followed by a five-day formal training course geared to the educational and expertise levels of the individuals, and to their own particular systems. Once a system is in operation maintenance specialists visit at least twice a year to provide on-the-job training for local operators and to perform any repairs that are beyond the operator's ability. Finally, an operation and maintenance manual is developed for each individual system using extensive pictures of all the components of the actual system. (See also W81-01381) (Seigler-IPA)

OPERATION, MAINTENANCE AND MANAGEMENT ASSISTANCE FOR RURAL SANITATION FACILITIES,
Alaska State Dept. of Environmental Conservation, Juneau.
J. W. Sargent.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 248-259. 2 Ref.

Descriptors: *Alaska, *Sanitation facilities, *Operation and maintenance, Rural areas, Cold regions, Public utilities, Sanitary engineering, Water works, Education, Management, Operations, Maintenance costs, Water systems, Public health.

The Alaska Village Safe Water (VSW) program, administered by the Alaska Department of Environmental Conservation (ADEC), conducts an operation and maintenance support program that offers financial, technical, and management assistance to the villages that have VSW sanitation facilities. A dominant feature of the program is the delegation of management program activities, as much as possible, to the villages themselves. Efforts are made to minimize direct State involvement in the management of VSW facilities. Villages may choose to accept the assistance and enter into a contract with ADEC and agree that funds will be spent according to the contract. Grant needs vary from 0 to 85% of the operating budget for a facility depending upon the village. Professional and technical services are provided by a field engineer who holds a separate contract with each village. He must be a 'Jack-of-all-trades' and must perform all activities reasonably required for administration, management, operation, and maintenance of a facility. A commercial bookkeeping firm handles the funding of the money to the villages. This VSW program is not a long-term solution to operational problems, but is simply designed to prevent the failure of existing VSW facilities before a solution is available. W81-01397

SOLVING SNOW-DRIFTING PROBLEMS AT BAKER LAKE, N.W.T., USING SNOW-MODELLING TECHNIQUES,
Interdisciplinary Engineering Co., Winnipeg (Manitoba).
K. M. Adam, and R. Piotrowski.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 394-408. 1 Fig, 1 Ref.

Descriptors: *Cold regions, *Model studies, *Snow drifting, *Snowpacks, *Snow management, Snow, Hydraulic models, Winter, Hydraulic similitude, Testing, Canada, Flumes, Northwest Territories, Winds, *Baker Lake(NWT).

Three hydraulic models were constructed for snow modelling at Baker Lake, a community of 1100 people located 240 km south of the Arctic Circle. The terrain is barren allowing snow to blow into the settlement from many kilometers to the north and it is common for several houses to be completely buried in winter. One model was a scale of one to one thousand of the whole townsite and surrounding terrain. A strip through Baker Lake parallel to the prevailing wind direction was modelled at one to four hundred. The third model, at a scale of one to four hundred was of the area of the proposed recreation center. Models were made of wood, concrete, and plasticine. The models were tested in a hydraulic flume with sand introduced into the water to simulate blowing snow. Results show that large obstructions upwind of the townsite will reduce the drifting problem. Staggered intermittent barriers of end-dumped or pushed up snow are more effective than a continuous barrier. Baker Lake constructed snow barriers at designated locations and they kept a previously impassable road from the settlement to the airport open. Sand-water modelling can help to find solutions to snow drifting at reasonable costs because the cost of model construction and testing is minimal compared to the construction of untested field solutions that fail. DOMESTIC WATER CONSUMPTION IN URBAN AREAS: A CASE STUDY IN IBADAN CITY, NIGERIA,
Ibadan Univ. (Nigeria). Dept. of Geography.
F. O. Akintola, and O. Areola.
Water Supply and Management, Vol 4, No 5/6, p 313-321, 1980. 1 Fig, 7 Tab, 3 Ref.

Descriptors: *Domestic water, *Water consumption, *Planning, Water management, Ibadan(Nigeria), *Nigeria, Water utilization, Projections, Water supply, Domestic water.

A study of residential water use in an upper middle class area of Ibadan, Nigeria, was undertaken to provide information for estimating future public water needs. Results of surveys in 565 households in three distinct areas show that residents in the more modern sections have a much higher water consumption (86 liters per day) than the national average (46 liters per day). Although the consumption rate is near that in advanced countries, most households surveyed are not yet equipped with appliances which use large quantities of water. Major uses of water are in toilets, floor scrubbing, car washing, and bathing. Water consumption is related to availability. For example, car washing uses 18 liters in areas where water is carried in buckets; 72 liters when hoses are available. Planners must base estimates of future water needs, not only on total population, but also on expected improvements in socio-economic status and living standards, which increase per capita water consumption. Policies proposed to limit excessive water use are water meters, increased rates, and modification of appliances. (Cassar-FRC)

FIVE-YEAR WATER RESOURCES RESEARCH AND DEVELOPMENT PLAN, GOALS AND OBJECTIVES, 1982-1986.
Minnesota Univ., St. Paul. Water Resources Research Center.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-156648, Price codes: A05 in paper copy, A01 in microfiche. Report submitted to the Office of Water Research and Technology, November, 1980. 82 p, 11 Fig, 8 Tab, 26 Ref.

Descriptors: *Minnesota, *Research priorities, *Planning, *Research and development, *Water resources, Water utilization, Water quality, Waste water(Pollution), Water conservation, Optimum development plans, Water policy, Water supply, Institutions, Water distribution(Applied), Wetlands, Water pollution, Groundwater, Water analysis, Water quality control, Water resources planning, *Five-year plans.

The State of Minnesota 1982-1986 five-year water resources plan includes a review of the State's water resources, their current and projected uses, water and related land planning and development activities, problems, and concerns of citizens groups and agencies, priorities of the Water Resource Research Center, and the five-year research, development, and technology transfer plans of the Center. Problems most urgently perceived as needing research were classified into five

area categories, with the State locations or agencies that expressed the research need indicated in the category sub-area listings. The prioritized categories (and sub-areas) were: (1) water quantity, supply, and distribution research needs (resource inventory, groundwater hydrology, water supply and storage); (2) water quality research needs (pollution standards, water quality data and data collection, health aspects, protecting groundwater from pollution, non-point source pollution, point source pollution, and waste water handling/purification); (3) conservation and water use efficiency (wetlands, storage/reuse); (4) economic/social/institutional (regional planning/feasibility, public education, data and information); and (5) water resources management (management of non-point pollution/wetlands/floods, data and prediction, water recycling/reuse, and water energy relationships). REGIONAL FIVE-YEAR (1982-1987) WATER RESOURCES RESEARCH: GOALS AND OBJECTIVES.
Utah Center for Water Resources Research, Logan.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-156622, Price codes: A03 in paper copy, A01 in microfiche. Pacific Southwest Region, Report submitted to the Office of Water Research and Technology, December, 1980. 37 p, 10 Tab, 8 Ref.

Descriptors: *Southwest U.S., *Research priorities, *Planning, *Research and development, *Regional analysis, *Water resources planning, Regions, Pacific coast region, Water resources, Water utilization, Water quality, Water pollution, Water conservation, Optimum development plans, Water supply, Water policy, Institutions, Water distribution(Applied), Runoff, Water analysis, *Five-year plans(Pacific SW region).

State five-year water resources research programs have been prepared for Arizona, California, Colorado, Nevada, New Mexico, and Utah. This regional plan has drawn on the State plans for descriptive information on State water resources, water uses and needs, research and planning activities, and water management problems to assist the identification of regional priorities for collective research. Fifteen regional research topics were identified and priority ranked as very high or high. Those topics rated as having very high regional priority were: (1) legal/institutional aspects of allocation of new (including cloud seeking, evaporation suppression, water harvesting) and newly quantified water supplies, and reallocation of existing supplies; (2) conjunctive management of surface waters and groundwaters; (3) contamination of groundwaters and surface waters by heavy metals, organics, and other toxic materials; (4) salt pickup processes in surface waters and movement through channels/reservoirs, for use in more effective water management and methods of salinity control; and (5) effects of mining activities (metals, fossil fuels, and others) on surface runoff, water quality, and groundwater movement and quality. These priority topics were assigned to separate States for assembling regional research teams. (Zielinski-IPA)

PROTECTING INSTREAM FLOWS IN MONTANA: YELLOWSTONE RIVER RESERVATION CASE STUDY,
Cooperative Instream Flow Service Group, Fort Collins, CO.; and Fish and Wildlife, Fort Collins. Western Energy and Land Use Team.
D. A. Sweetman.
Instream Flow Information Paper No 10, Report FWS/OBS-79/36, September, 1980. 85 p, 24 Ref, 5 Append.

Descriptors: *Water allocation(Policy), *Water law, *Streamflow, *Water permits, Montana, Water utilization, Non-consumptive use, Competing uses, River flow, River basins, Water rights, Wildlife conservation, Water quality, *Yellowstone River Basin(MT).

The method used by the Montana Board of Natural Resources and Conservation in making water reservation determinations in the Yellowstone River Basin is reviewed to provide information as to the usefulness of this form of water allocation. While the Yellowstone has a mean annual flow of 8.8 million acre feet, the all-time low was approximately 4.1 million acre feet: in some years it is possible to satisfy all water uses, while in other years many users will be unsatisfied. The Montana Water Use Act of 1973 established a permit system for all new water rights, and recognized instream rights. Thirty water reservation requests were submitted to the board, including nonconsumptive use requests for almost the entire average flow to protect wildlife, recreation and water quality. The reservations established by the Board's actions secured water rights provided for minimum stream flows, and allowed for future water utilization in areas other than those addressed under the reservation process. Implementation of the instream flows granted in the Yellowstone Basin may serve to protect the continued existence of one of the Nation's last remaining free-flowing rivers. The reservation process appears to have been well accepted in this case, with only two parties appealing the decisions. (Moore-SRC)

INSTREAM FLOW NEGOTIATION: REVIEW OF PRACTICES,
M. R. White, F. D. Valdez, and M. D. White.
Fish and Wildlife Service, Biological Services Program Report FWS/OBS-80/53, September, 1980. 78 p, 26 Ref.

Descriptors: *Negotiations, *Streamflow, *Water rights, Attitudes, Legal aspects, Decision making, Water utilization, Flow rates.

This review summarizes research, findings, and recommendations of practitioners in the art of negotiation, and applies them to negotiations undertaken to preserve and protect instream flows. Negotiation is a method of social decision-making, consisting of choices involving another party, accomplished by persuasion and haggling. Negotiators may choose between clear-cut alternatives, but more often must balance and weigh values on the way to an agreement. Negotiators may or may not define the issues in the same way, gradually converge toward a compromise situation, agree on the value of issues, and agree on relative bargaining power. Most negotiations involve both bargaining and debate. Negotiators cooperate to increase their common interest as well as their individual interests. It is difficult to find a single standard by which to judge negotiation, negotiators, or outomes. Bargaining reputation is extremely important, and face-saving is a powerful motive in negotiation. Negotiators are reluctant to yield or concede a point and are unwilling to acknowledge concessions they have made. For this reason, concessions may occur only in the context of a trade. Negotiating behavior is shaped by the context for negotiation, including the issues, their complexity, the team structure, and the team style. (Moore-SRC)

STATE OF THE STATES: WATER RESOURCES PLANNING AND MANAGEMENT.
Water Resources Council, Washington, DC.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-182975, Price codes: A08 in paper copy, A01 in microfiche. Report, April, 1980. 153 p, 10 Tab, 37 Ref, 4 Append.

Descriptors: *Planning, *Water resources, *Water management(Applied), *Water quality control, State governments, Water supply, Regional development, Water law, Overdraft, Erosion, Floods, Wetlands, Permits, Legislation, Flood plains, Comprehensive planning, Water resources development.

This study was conducted to take stock of water resources planning and management trends at State and regional levels, as well as those water resources issues that confront State and regional efforts. It provides an overview of quality and quantity planning and management activities and summarizes the current status of State water quality planning, regulation, standard setting, wastewater facility construction, and other management activities. Virtually every State and region is experiencing a range of water resources problems, the most frequently noted being: overdraft of groundwater; erosion and sedimentation of river banks; and flooding, caused by the development of wetlands and floodplain, and insufficient management techniques. States' legislative authorization for addressing water resources problems vary widely. Two states, Delaware and Florida, have recently mandated totally comprehensive approaches to the planning and management of water resources, while 27 additional States have authorized some form of comprehensive water resources planning. Western states have tended to integrate water quality planning and management functions into a single agency, while northeastern States have been more apt to integrate water quality and quantity planning into a single agency. The legislative trend in the management of water resources is toward the establishment of some sort of permit system. (Moore-SRC)
W81-01233

EVOLUTION OF THE WATER AND SANITATION POLICY AND PROGRAM IN THE NORTHWEST TERRITORIES,
Construction for the Government of the Northwest Territories, Yellowknife Dept. of Local Government.
V. Christensen.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 9-18.

Descriptors: *Canada, *Northwest Territories, *Water policy, *Cold regions, *Sanitary engineering, Waste disposal, Plumbing, Public health, Sewage, Water storage, Water supply, Sewage disposal, Sewerage, Environmental sanitation.

Since its establishment in 1976, the Water and Sanitation Section of the Department of Local Government has made substantial progress with the problems of water and sanitation services in the Northwest Territories. Despite this progress another six to eight years will be needed to provide an acceptable level of service across the Territories. Although the first Northwest Territories Council was established in 1875, it was not until the 1960's that the need for improved water and sanitation services was recognized. Prior to 1976 most of the area's water policies were inefficient due to inadequate funding and lack of engineering experience with the cold climate. Current policy is being modified on an ongoing basis to develop a policy compatible with the prevailing social and economic conditions in the Territories. A major impediment to improved water and sanitation services remains the poor standard of housing in the northern communities. All new houses are now being provided with larger water and sewage storage tanks to end the need for bagged sewage collection. Projects are also underway to inform the public of the reasons and management methods for proper garbage collection and disposal systems. (See also W81-01381) (Seigler-IPA)

6G. Ecologic Impact Of Water Development

EFFECTS OF ALTERATIONS TO LOW GRADIENT REACHES OF UTAH STREAMS,
Utah Cooperative Fishery Research Unit, Logan.
R. S. Wydoski, and W. T. Helm.
Fish and Wildlife Service, Biological Services Program, Report FWS/OBS-80/14, April, 1980. 178 p, 48 Fig, 45 Tab, 130 Ref, 6 Append. 14-16-008-1141.

Descriptors: *Stream improvement, *Sport fish, *Invertebrates, *Fish populations, Channel morphology, *Utah, Streambeds, Dredging, Aquatic habitat, Stream erosion, Fish reproduction, Stream

fisheries, *Environmental effects, Biomass, Flood control, Trout, Ecology.

Stream channels in the semi-arid intermountain west have been modified for many years by agricultural interests, primarily to provide flood protection. Of special concern is the relationship between stream channel modification and the high value fishery resource. This report describes an investigation of the effects of stream channelization on fish and macroinvertebrates in low gradient reaches of Blacksmith Fork River and the Logan River in the floodplain of Cache Valley in northern Utah. Dredged, recently bulldozed, and old bulldozed sites, plus two control areas, were selected for study. Erosion and deposition of streambed gravel were directly correlated with the percentage of stream reach that was altered. High stream flows in spring appeared to be required to maintain the depth and frequency of pools. Channelization adversely affected both fish and macroinvertebrate populations and biomass, with the severity of impact directly related to the amount and duration of disturbance of the physical habitat. In all bulldozed sites the trout populations were not self-sustaining. Dredging had less effect than bulldozing on survival of age 0 fish, but dredging may reduce spawning in the future. Water temperature, water chemistry, sampling information, a macroinvertebrate list, and length and weight information on invertebrates is provided in microfiche appendices. (Moore-SRC)

Tudor Engineering Co., San Francisco, CA.
Water and Power Resources Service Report, October, 1980. 283 p. DV-00031.

Descriptors: *Sites, *Hydroelectric plants, *Social aspects, *Environmental effects, Recreational facilities, Parks, Natual resources, Wildlife habitats, Wild rivers, Scenery, Federal reservations, Public lands, Data collections, Water resources development, Reservoir sites, Regional analysis, Western states.

The low-head hydroelectric sites left after the preliminary economic sizing and analysis were screened to identify those which indicated the highest promise of development based on environmental and social concerns. A broad data base was developed that identified the location and potential seriousness of recognized constraints on future hydropower developments. A graduated system of constraint categories was developed, designating them as either Serious, Potentially Serious or Minor. Serious constraints include: wild, scenic and recreational rivers; listed wilderness areas; areas established as parks, monuments, refuges, and wildlife managment areas; areas listed as historical places, landmarks, and research natural areas; and areas established as critical habitats for endangered or threatened species. Potentially Serious constraints are those that have high probability in the future, or upon further project feasibility investigations of being serious constraints. Minor constraints are those which could be overcome with reasonable mitigation measure, and which would probably not preclude development, such as National Forests. This information is provided in tabular form for sites in Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Texas, Utah, Washington, and Wyoming. EFFECTS OF ALTERATIONS TO LOW GRADIENT REACHES OF UTAH STREAMS: SUMMARY,
Utah Cooperative Fishery Research Unit, Logan.
R. S. Wydoski, and W. T. Helm.
Fish and Wildlife Service, Biological Services Program, Report FWS/OBS-80/13, April, 1980. 17 p, 8 Fig. 14-16-0008-1141.

Descriptors: *Stream improvement, Sport fish, *Invertebrates, *Fish populations, Channel morphology, *Utah, Streambeds, Aquatic habitat, Stream erosion, Dredging, Stream fisheries, *Environmental effects, Biomass, Flood control, Brown trout.

Stream channels in the semi-arid intermountain west have been modified for many years by agricultural interests, primarily to provide flood protection. Of special concern is the relationship between stream channel modification and the high value fishery resource. This report summarizes an investigation of the effects of stream channelization on fish and macroinvertebrates in low gradient reaches of Blacksmith Fork River and the Logan River in the floodplain of Cache Valley in northern Utah. Erosion and deposition of streambed materials were directly correlated with the length of stream that was altered and the type of alteration. Channelization adversely affected both fish and macroinvertebrate populations and biomass, with the severity of impact directly related to the amount and duration of disturbance of the physical habitat. Populations, biomass and production of brown trout and mountain whitefish appeared to be directly related to the proportion of the stream reach that contained pools. (Moore-SRC)

WATER QUALITY AND ENVIRONMENTAL IMPACT MODEL OF THE UPPER NILE BASIN,
Royal Danish School of Pharmacy, Copenhagen. Dept. of Chemistry.
S. E. Jorgensen.
Water Supply and Management, Vol 4, No 3, p 147-153, 1980. 4 Fig, 1 Tab, 6 Ref.

Descriptors: *Model studies, *Water quality, *Nile River, River basin development, Watershed management, River systems, Future planning, Surveys, Environmental effects, DDT, Eutrophication, Zooplankton, Nutrients, Snails, Irrigation, Industries.

The HYDROMET project, which is an international survey effort on the Nile River Basin, has been given approval for expansion into a water quality model to give information on lakes, eutrophication, aquatic life, irrigation, industrial wastes and environmental impact. To meet all of these objectives accurately, more comprehensive biological data collection procedures have been adopted with storage of information into a data base, and submodels have been formulated which will feed data into the system. Areas of focus of the smaller models include algal growth, zooplankton, fisheries, nutrient exchange between sediment and water, mass balances of P, N, Si, O, and C, a bilharziosis (snail) model, DDT, Cu and the water and salt balance. Flow charts for each submodel and calibration data are examined to simplify the understanding of the main model. The water quality model will be an important management tool in the Lake region as this area becomes more developed. The model will also help in the decision making process and in the planning of environmental policy. An example of the application of the model to the decision making process on a contrived scheme to build an ammonia fertilizer factory in the area is given. The model will require an intensive training program on its proper use plus a system of dynamic feedback from applied situations to ensure its validity in comprehensive planning and water quality management. 7. RESOURCES DATA

7A. Network Design

SURFACE WATER DATA, ATLANTIC PROVINCES, 1979.
Water Survey of Canada, Ottawa (Ontario). Inland Waters Directorate.
Report, 1980. 111 p.

Descriptors: *Surface water availability, *Gaging stations, *Canada, *Streamflow, *Basic data collections, Monitoring, Flow measurement, Bodies of water, Surface waters, Rivers, Running waters, Water resources, Streams, Data collections, On-site data collections, Hydrologic data, Measurement, Networks, Stations, Statistics, Flow rates, Discharge(Water), Water levels, *Atlantic Provinces(Canada).

Surface Water Data reports have been published in various formats in imperial units since 1908 in approximately 270 publications. This is the first report presented in the International System of Units (SI). The format has remained the same, with Canada divided into eight regions. The provinces usually each represent a separate region, but the Atlantic Provinces region is comprised of New Brunswick, Newfoundland, Nova Scotia, and Prince Edward Island. The present report covered the results of the hydrometric survey investigations made in the Atlantic Provinces (including Labrador) for the 1979 calendar year. These data are published annually on a calendar year basis, and the stations are listed alphabetically, with yearly data on two stations given per page. The general method for data tabulation included (1) a table of daily water level or discharge, (2) a summary of monthly and annual data, and (3) descriptive information (such as gauge type, gauge location, drainage area). (Zielinski-IPA)
W81-01214

SURFACE WATER DATA, YUKON AND NORTHWEST TERRITORIES, 1979.
Water Survey of Canada, Ottawa, (Ontario). Inland Waters Directorate.
Report, 1980. 88 p.

Descriptors: *Basic data collections, *Canada, *Gaging stations, *Surface water availability, *Streamflow, Monitoring, Flow measurement, Bodies of water, Surface waters, Rivers, Running waters, Water resources, Streams, Data collections, On-site data collections, Hydrologic data, Measurement, Networks, Stations, Statistics, Flow rates, Discharge(Water), Water levels, *Yukon, *Northwest Territory(Canada).

Results of the hydrometric survey investigations are presented in terms of daily discharge rates (cubic meters per second) for each day of 1979 for the various stations in the Canada region represented by the Yukon and Northwest Territories. This is one of eight regions that Canada is divided into for the purpose of these Surface Water Data compilations. Surface Water Data reports have been published in various formats in imperial units since 1908 in approximately 270 publications. This is the first report presented using the International System of Units (SI). These data are published annually on a calendar year basis. The report represents the data of the stations alphabetically, with yearly data on two stations per page. The general method for data tabulation for each station has included (1) a table of daily discharge rates or daily water levels, (2) a summary of annual and monthly data, and (3) descriptive information (such as gauge type, gauge location, and drainage area in kilometers). Highest annual discharge rates generally occur within the May-September time-frame. (Zielinski-IPA)

WATER QUALITY MONITORING--SOME PRACTICAL SAMPLING FREQUENCY CONSIDERATIONS,
Colorado State Univ., Fort Collins. Dept. of Agricultural and Chemical Engineering.

J. C. Loftis, and R. C. Ward.
Environmental Management, Vol 4, No 6, p 521-526, November, 1980. 2 Fig, 15 Ref.

Descriptors: *Sampling, *Water sampling, Monitoring, *Water quality, Mathematical studies, Network design, Water analysis, Illinois, Frequency, Seasonal.

Relationships between water quality sampling frequency in a monitoring network and the effect of statistical methods and assumptions on sampling frequency were examined. Detailed data from the Illinois State Water Survey network was studied using 3 methods: (1) considering neither seasonal variation nor serial correlation (the most widely used method), (2) considering only seasonal variation, and (3) considering both seasonal variation and serial correlation (assumed to be the most accurate method). Confidence level widths for each were plotted as a function of sampling frequency, which were divided into 3 regions with zones of uncertainty between each region. In Region 1 (sampling interval, 1-12 days), Method 3 is most accurate; in Region 2 (sampling interval, 12-34 days), Method 1 or 3 apply; and in Region 3 (sampling interval greater than 34 days), Method 1. SAMPLING AND THE REGULATORY MAZE IN THE UNITED STATES,
Illinois Environmental Protection Agency, Springfield.
D. J. Schaeffer, J. B. Park, H. W. Kerster, and K. G. Janardan.
Environmental Management, Vol 4, No 6, p 469-481, November, 1980. 1 Fig, 52 Ref.

Descriptors: *Sampling, *Regulation, *Water quality standards, Illinois, Monitoring, Water pollution control, Cyanide, Ammonia, Standards.

The problem of sampling is related to the maze of environmental regulation in the United States. Actions that develop from regulations affect sampling, and conversely, analyses and sampling are used as a basis for setting standards. Procedural problems are illustrated by the example of the dieldrin residue limit for animal feed established by the U.S. EPA. This standard was set by relying on the fish bioaccumulation factor rather than acute and chronic toxicity data, arriving at a value of 0.005 ppb, which is not detectable except by the most refined research techniques. This makes routine sampling and analysis suspect. Suggestions are made for improvements to the National Pollutant Discharge Elimination System reporting system, to make the data received more useful. Testing and analysis problems are illustrated by the cyanide standards hearings held in Illinois, which took 3 years to develop a 0.005 mg per liter standard, a level which requires development of new analytical methods. Two groups within EPA are now working on the ammonia effluent standards, making possible a double set of regulations. Recommended sample preservation procedures are frequently impractical and expensive. However, in the case of phenol sampling, only one general sentence was given as instruction. Further problems involve collection of composite samples, trace organic compounds, rounding of results, and lack of objectives described for the data acquired. (Cassar-FRC)
W81-01258

ANALYTICAL ISSUES IN COMPLIANCE MONITORING,
J. K. Rice.
Environmental Science and Technology, Vol 14, No 12, p 1455-1457, December, 1980. 2 Tab.

Descriptors: *Water analysis, *Monitoring, Data collection, Data acquistion, Analytical techniques, Measurement.

Modifications are suggested to ensure accurate results in compliance monitoring for pollutant dischargers. It is suggested that steps which will be followed both inside and outside the laboratory for the analysis of water samples be specified in the outlined standard method. These steps are deemed essential to the reliable performance of monitoring. A determination of the overall precision of the monitoring method is needed. The method which is designed and accepted must be applied only to the matrices for which it was validated. When the precision of a method has been determined for a single matrix, this does not allow it to be used universally. Terms used in the process of measurement must be accurately and consistently defined. (Baker-FRC)

ERROR DETECTION SYSTEM FOR CLIMATIC AND HYDROLOGIC DATA,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agricultural Engineering.
J. C. Carr, V. O. Shanholtz, and B. B. Ross.
Transactions of the ASAE, Vol 23, No 5, p 1127-1130, October/November, 1980. 1 Fig, 6 Ref.

Descriptors: *Data processing, *Computer programs, *Climatic data, Error detection, Hydrologic data.

This paper summarizes the data error detection phase of the climatic and hydrologic data management program. The package consists of 3 programs, an error diagnostic program which scans input data for errors detectable by computer-based algorithms, a program which updates and corrects basic data files, and a third program, which detects errors in the recording of timing of precipitation and runoff events from a given watershed. Examples of errors detected by this system are gross mistakes in depth and change in a given time increment, incorrect designation of Standard or Daylight Saving Time, evaporation loss in rain gauges, and data out of the proper sequence. DETERMINATION OF DEUTERIUM/HYDROGEN RATIOS IN NATURAL WATERS BY FOURIER TRANSFORM NUCLEAR MAGNETIC RESONANCE SPECTROMETRY,
Hong Kong Univ. Dept. of Chemistry.
R. S. Tse, S. C. Wong, and C. P. Yuen.
Analytical Chemistry, Vol 52, No 14, p 2445, December, 1980. 2 Ref.

Descriptors: *Isotope studies, *Deuterium, Hydrogen, Spectrometers, Analytical techniques.

A multinuclear Fourier transform nuclear magnetic resonance spectrometer was used to determine deuterium/hydrogen isotope ratios in natural waters. A 2 ml water sample and an internal working standard of lithium iodide in 2% deuterium-enriched acetone were used. Calibration of the standard was done by adding known volumes of deuterium oxide to a sample. Results obtained were as follows: International Atomic Energy Agency V-SMOW No. 268, 155.6 + or - 0.12 ppm (IAEA value, 155.76 + or - 0.05 ppm); SLAP No. 259, 88.8 + or - 0.18 ppm (IAEA value 89.02 + or - 0.05 ppm); local tap water, 153.5 + or - 0.2 ppm. (Cassar-FRC)

CYTOSOME MORPHOGENESIS IN NERVE CELLS AND LATERAL CILIO-INHIBITION IN THE MUSSEL, MYTILUS EDULIS,
Southern Illinois Univ. at Carbondale. Dept. of Anatomy.
A. Paparo, and J. A. Murphy.
Journal of Submicroscopic Cytology, Vol 12, No 4, p 547-562, 1980. 12 Fig, 47 Ref. OWRT-B-119-ILL(1), 14-34-0001-9069.

Descriptors: *Cytological studies, *Aquatic animals, *Mussels, Physiological ecology, Mollusks, Aquatic environment, Light, Temperature, Effects, Central nervous systems, Gills, *Radioisotopes, Analytical techniques.

Visceral ganglion, branchial nerve and gill preparations were studied in the mussel, Mytilus edulis. The ganglia and nerves contain yellow pigment granules (Cytosomes) which are ultrastructurally altered in response to visible light (490 nm). The frequency of the conversions in cytosomes (immature, mature, paracrystalline and lamellar formation) are directly related to the duration of light exposure and temperature. Autoradiographic/radioisotopic incorporation studies indicated that the Golgi apparatus plays a role in the formation of these neutonal pigment granules. The percentage of lamellar type granule conversions can also be influenced by gradual anoxic conditions, i.e., treatment with pentylenetetrazole or dopamine, or high frequency branchial nerve stimulation. Microspectrofluorometric analyses indicate that these parameters also change the absorption spectra of the yellow pigment in cytosomes. Furthermore, lateral cilio-inhibition is observed in those preparations with the greatest number of 'secondary conversions' of cytosomes in their neutons. The magnitude of this cilio-inhibition seems to be related to the percentage of lamellar transformations in cytosomes. Since sequestered calcium has been shown to be released from lamellar-type granules, it is postulated that the cilio-inhibition observed in this study is due to an increase in the neuronal intracellular (Ca++) with subsequent release of the cilio-inhibitory agent, dopamine.

PRESSURE TRANSDUCER FOR REMOTE DATA ACQUISITION,
Robert S. Kerr Environmental Research Lab., Ada, OK.
C. G. Enfield, and C. V. Gillaspy.
Transactions of the ASAE, Vol 23, No 5, p 1195-1196, 1200, October/November, 1980. 5 Fig, 25 Ref.

Descriptors: *Transducers, *Pressure measuring instruments, *Remote sensing, Manometers, Instrumentation, Soil water, Irrigation.

An inexpensive pressure transducer, applicable to most water management and research needs, has been developed for automated data acquisition in the field. This device, based on a standard mercury manometer, is linearly temperature-dependent and gives a frequency output as a function of pressure output. Construction materials are nylon tubing, stainless steel tubing, shielded cable, vented cap, multivibrator circuit, nichrome electrode, mercury, and a container for mercury. Measurements, calibrated within 1 mbar, were tested over a range of 0.2 to 0.8 bars. The capacitance of the transducer is transformed to audio frequency, which can be transmitted through shielded cables without frequency shift or impedance loading to the output transistors. MODELLING GROUNDWATER CONTAMINATION FROM LAND-APPLIED SWINE WASTE,
British Columbia Univ., Vancouver. Dept. of Bio-Resource Engineering.
B. R. Cappelaere, and T. H. Podmore.
Transactions of the ASAE, Vol 23, No 5, p 1147-1152, October/November, 1980. 7 Fig, 19 Ref.

Descriptors: *Farm wastes, *Nitrates, *Aquifers, Groundwater movement, Water table, Mathematical models, Water pollution sources, Leaching, Fertilizers, British Columbia, Soil contamination, Hogs.

A one-dimensional model was used to simulate water table fluctuations and nitrate distribution in order to improve waste management practices. The specific problem was a shallow, unconfined aquifer in British Columbia used as a source for residential water and for raising livestock. Liquid

swine waste was applied to a 5 hectare pasture on the upper reaches of the aquifer. The model, based on the flow and convection/dispersion equations, was used to estimate nitrate loading leached to the groundwater and nitrate concentration profiles. Observed and predicted water table fluctuations agreed closely. (Cassar-FRC)

A FIELD EVALUATION OF THE HASL WET-DRY DEPOSITION COLLECTOR,
Department of Energy, New York. Environmental Measurements Lab.
D. C. Bogen, S. J. Nagourney, and C. Torquato.
Water, Air, and Soil Pollution, Vol 13, No 4, p 453-458, December, 1980. 2 Fig, 3 Tab, 9 Ref.

Descriptors: *Sampling, *Rain gages, American Samoa, *Sea spray, Precipitation gages, *Chemical analysis, Sampling, Methodology, Equipment, Wet-dry deposition collector.

The efficiencies of a HASL (Health and Safety Laboratory) wet/dry deposition collector and a total collector were compared at Tutuila Island, American Samoa. At this location, wet deposition is exclusively rain; sea spray aerosol is the major source of dry deposition. Volumes of water deposited in duplicate wet/dry collectors were within 4% of the rain gauge measurements after corrections for evaporation were made. The wet and dry sides of the HASL collector picked up about 90% of Cl(-), SO4(--), Ca(++), Na(+), Mg(++), and K(+) compared with the total collector, which is continuously exposed to the atmosphere. Results for Ca(++) and K(+) were variable because of analytic uncertainties at the low concentration in the samples. These differences in collection efficiencies were not considered significant. LARGE SCALE DEVELOPMENT OF REMOTE HOUSING IN SUBARCTIC AREAS,
R and M Consultants, Inc., Anchorage, AK.
W. A. Robertson, and R. L. Schreader.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 426-438. 4 Fig, 6 Ref.

Descriptors: *Alaska, *Terrain unit mapping, *Aerial photography, *Photogrammetry, Remote sensing, Permafrost, Septic tanks, Soil disposal fields, Permeability, Soil physical properties, Waste disposal, Sewage disposal, Terrain analysis, Geomorphology, Mapping, Topographic mapping, Surveys.

Terrain unit analysis was used to analyze 1,862 ha at Glennallen, Alaska, to aid in compliance with water and sewer regulations pertaining to the land prior to its transfer from State control to private control. Terrain unit analysis consists of identifying landforms by airphoto interpretation and defining the variations of geotechnical conditions for each landform by actual ground truth observations and borings. This method was successfully used on the Trans-Alaska Pipeline Project. For the Glennallen project, all available aerial photographs were collected and a preliminary terrain unit map was produced. Some of the area was covered by a previous engineering geologic map and this map was used for cross checking. Next, high quality 1 cm = 120 m aerial photographs were obtained for detailed photogrametric mapping. A limited amount of field truth was done to substantiate the mapping results. Three separate cases or ground types were observed from the analysis and recommendations were made as to lot size, suitability for on-site sewage disposal, and maximum recommended density. The Alaska Department of Environmental Conservation approved the mapping results and parts of the area were opened to the public in 1979. The use of terrain unit mapping rather than conventional techniques allowed substantial savings in both time and money in the development of this remote housing project. STUDIES OF UTILITY CONSTRUCTION IN COLD REGIONS,
Ontario Ministry of the Environment, Toronto.
M. Fielding.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Aberta, Report No EPS 3-WP-80-5, October, 1980, p 136-139. 1 Fig, 5 Ref.

Descriptors: *Canada, *Ontario, *Utilities,*Water works, *Cold regions, Freezing, Frost heaving, Manholes, Soil temperature, Concrete pipes, Insulation, Polystyrene, Stress gauges, Muskeg, Heat of fusion, Water temperature.

On-going, problem oriented work on utility delivery in the Province of Ontario is reported. Population centers between 45 and 50 degrees North with a January design temperature range from -20 to -40C are being used. Trenching in muskeg and Precambrian rock is generally involved in utilities construction in these areas. An initial study involved temperature monitoring in the soil surrounding an insulated watermain. The watermain consisted of 30 km of 600 mm reinforced concrete pipeline buried to a cover of 1.1 m and insulated with a 50 mm by 2.5 m slab of polystyrene. Although frost penetration was greater than expected, freezing of the pipe contents did not occur probably due to the latent heat of fusion of the contents. Data from this study prompted an analysis of the theoretical aspects of pipeline freezing. Analysis results concluded that existing standard theory can be used to calculate design temperatures at any given depth in the soil and from this the residence time above which pipe contents will freeze can be determined. On-going studies include a soil temperature measuring project at Keewatin, Ontario, and an induced stress project on precast concrete manholes at Thessalon, Ontario. CRITICAL EVALUATION OF INSULATED SHALLOW BURIED PIPE SYSTEMS IN THE NORTHWEST TERRITORIES,
Construction for the Government of the Northwest Territories, Yellowknife Dept. of Public Works.
F. W. James.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 150-186. 44 Fig.

Descriptors: *Northwest Territories, *Canada, *Public utilities, *Cold regions, *Plastic pipes, Freezing, Insulation, Water conveyance, Manholes, Hydrants, Permafrost, Pipelines, Sanitary engineering, Cost analysis, Thawing, Freeze-thaw tests.

Experiences from the sad and expensive history of piped utility system in northern permafrost regions has lead to the design of an insulated shallow buried pipe system that appears to be a good standardized economically practical, northern pipe system. The water system has a single pipe recirculation design consisting of one or more uninterrupted loops coming from a recirculating facility and returning to that facility without branch systems. It operates as a normal gravity system. Water and sewer transmission mains are individually insulated and are placed in the same trench. The pipes are high density polyethylene covered with insulation of high density urethane. The outermost pipe cover is an extruded impermeable plastic jacket. Back up freeze protection systems include heat trace, thaw tubes, thaw wires, and bleeding. Pipes are continually joined by butt fusion. Service manholes are large enough to permit servicing inside and are placed at a maximum spacing of 100 m. The shallow buried system minimizes energy input for operation, is simple to operate and maintain, allows maximum use of short construction seasons, can be drained, has a minimum 20-year design life, minimizes on-site labor, and is economically practical. PRE-INSULATED HIGH DENSITY POLYETHYLENE PIPING – THE EVOLUTION OF A NORTHERN ACHIEVEMENT,
Du Pont of Canada Ltd., Mississauga (Ontario). Pipe Div.
A. D. Whyman.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 187-220. 18 Fig, 5 Ref.

Descriptors: *SCLAIRCOR, *Canada, *Cold regions, *Plastic pipes, *Public utilities, Freezing, Thawing, Plumbing, Sanitary engineering, Water supply, Sewage, Sewers, Water delivery, Water works, Insulation, Polyurethane, Polyethylene, Pipelines, Piping systems(Mechanical).

Du Pont of Canada's SCLAIRCOR pre-insulated piping system has been greatly refined and improved since its introduction in 1976 so that it is now a desirable system for utilities in northern regions. SCLAIRCOR is composed of three elements: SCLAIRPIPE high-density polyethylene pipe and fittings, factory-applied rigid polyurethane foam insulation and fittings insulation covers, and ECONOTRACE parallel-resistance heat tracing cable and accessories. An extruded polyethylene jacket is used as a cover for underground applications while a spirally formed galvanized steel or aluminum cover is used above ground. All components are manufactured in Canada and the pipe is shipped in 38 or 50 foot lengths. Sections are joined by butt fusion. By 1979 more than 200 installations had been made for a total of approximately 305,000 m. The evolution of many basic configurations and applications has lead to a moratorium on design changes and a prime concern for standardization. Du Pont also offers extended product information and aids for planning and design such as the PIPETEMP Thermal Analysis program, the HYDTRAN Hydraulic Transient Analysis, and the SESME Stress Evaluation for Marine Applications. W81-01391

THE APPLICATION OF SKIN EFFECT CURRENT TRACING FOR FREEZE PROTECTION OF WATER SYSTEMS,
RICWIL, Inc., Brecksville, OH.
R. W. Tracey.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 263-287. 17 Fig, 2 Tab.

Descriptors: *Skin Effect Current Tracing, *Cold regions, *Pipelines, *Freezing, Pipes, Utilities, Water works, Heating, Water temperature, Heat transfer, Electric currents, Electrical grounding, Electrical properties, Insulation, *Heated pipelines.

Skin Effect Current Tracing (SECT), a circuit comprised of a carbon steel heat tube and an insulated, stranded copper heating cable, provides a unique, reliable method of electrically heating pipe line systems. SECT uses an AC power source to pass the heating current through the cable with the circuit being completed by the current passing through the heat tube and back to the power source. Due to the ferromagnetic properties of the heat tube and the skin effect, the maximum penetration of current density through the wall of the heating tube is only 0.9 mm. The skin effect is the concentration of the return current near the inner surface of the tube. The skin effect makes SECT electrically safe and allows the piping system to be grounded. SECT also has a reliable automatic temperature control that controls pipe temperature well within + or - 5%. Existing installations account for over 250 SECT traced lines in operation for a 15 year period. SECT heating can be adapted to a wide variety of piping systems according to region environment and functional application needs. This heating system features very efficient heating, energy savings, reliability, low mainte-

nance, and favorable operating costs. (See also W81-01381) (Seigler-IPA)

ELECTRIC HEAT TRACING AND ENERGY CONSERVATION FOR NORTHERN INSTALLATIONS,
Thermon Mfg. Co., San Marcos, TX.
B. C. Johnson, R. K. Pitzer, and G. Tarbutton.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980. p 288-309. 8 Fig, 11 Tab, 6 Ref.

Descriptors: *Electrical mining, *Heat tracing, *Energy conservation, *Cold regions, Electrical resistance, Electrical properties, Electrical impedence, Electrical equipment, Electrical design, Electric cables, Public utilities, Pipelines, Water works, Freezing, Monitoring, *Heated pipelines.

The conservation of energy and money for electric heat tracing of northern pipe installations requires well-sealed, economically-selected thermal insulation, a dependable control system, and a heating cable that matches the thermal requirements of the system. The selection of proper insulating material considers thermal characteristics, mechanical properties, chemical requirements, moisture resistance, health and safety, and cost. The insulation must be dry for proper operation of an electrically traced system. The two most common types of weather barriers for field installed insulation are metal jacketing and mastics. Types of heating cables available today include resistance heating cable or tapes in either series or parallel, Skin Effect Current Tracing, impedence heating, and induction heating. Resistance heating is most widely applied for freeze protection and general process temperature maintenance. Circuit controls available include mechanical controllers, electronic controllers, thermocouple sensing elements, radiation or optical pyrometers, and metallic or non-metallic thermoresistive sensory elements. Heating elements are monitored and alarmed to assure operational status. Required design consideration are listed and discussed. (See also W81-01381) (Seigler-IPA)
W81-01399

THAWING OF FROZEN WATER SERVICES,
Western Water and Sewer Supplies (1978) Ltd., Edmonton (Alberta).
R. Currey.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October 1980, p 310-313. 1 Fig.

Descriptors: *Thawing, *Freezing, *Water works, *Cold regions, *Pipes, Insulation, Water temperature, Hot water, Pipelines, Electrical equipment, Electric currents, Soil temperature, Frost protection, Public utilities.

Electrical thawing and hot water thawing are the two accepted methods of thawing frozen service lines. Despite compliance with design criteria stating that all utility service lines must be installed below the normal frost level, subsequent activities such as street grading, driveway excavation, and sidewalks can cause freeze ups due to lack of soil cover. Thawing with electricity involves passing an electrical current through the service line pipe to increase the temperature and melt the ice. Gasoline powered welders can be used to provide the electrical energy. Asbestos cement water mains with copper service lines are thawed by using 200 to 300 amps ranging from 10 to 40 volts for a few minutes. Electrical thawing must be done by qualified people due to the hazards of stray electrical currents. Hot water thawing is internal thawing done by including hot water directly into the problem area. This method is preferred over electrical thawing because all types of service lines can be thawed with the hot water probe, initial equipment costs are less, it is quicker, and less labor is required. After thawing further freeze ups can be prevented by lowering the grade of the line, increasing insulation, increasing ground cover, changing traffic patterns, or continuous bleeding. Descriptors: *Utilidors, *Inuvik, Northwest Territories, *Freezing, *Protection, Computer programs, Computer models, Cold regions, *Pipelines, Soil temperatures, Mathematical models, Model studies, Water works, Thermal properties, Water distribution.

HYDROTHERM, a computer program that simulates the hydraulic and thermodynamic aspects of a pipe network was used to analyze the thermal behavior of Inuvik's utilidor system. Inuvik is in an area of highly thaw sensitive permafrost, and a variety of utilidor designs with various freeze protection methods have been used in an attempt to reduce extremely high capital costs. HYDROTHERM has nine active programs run in an automatic self-generating order. The program is iterative with pressure, flows, and temperatures calculated and corrected from one iteration to the next. Heated and unheated utilidors were considered separately because their circulation and thermal effects are extremely different. Results show that freeze protection in the heated utilidors may be marginal for extended cold weather periods. Also, in these heated utilidors, freeze protection under extreme conditions is partly dependent on water demand. Unheated utilidors appear to have adequate freeze protection under present and proposed operating conditions, with the exception of one section. Results also show that the use of heat lost from heating pipes as a means of protection is inefficient and difficult to control, while forced circulation and heat addition directly at selected locations was efficient and controllable. WATER DISTRIBUTION PIPE NETWORKS FOR ARCTIC SETTLEMENTS,
McMaster Univ., Hamilton (Ontario). Dept. of Civil Engineering and Engineering Mechanics.
W. James, and M. A. Robinson.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 347-363. 1 Tab, 4 Ref.

Descriptors: *Canada, *Computer programs, *FASTPIPE, *Networks, Public utilities, Algorithms, Optimization, Data processing, Model studies, Cold regions, Mathematical models, Freezing, *Pipelines, Water distribution, Computer models, Design criteria.

The FASTPIPE computer program, which uses a variety of individually operating algorithms to aid in the design of water distribution networks, was upgraded using interactive conservational software to produce a fast, efficient, easy-to-use method for computing optimum designs for Canadian pipe distribution systems. Algorithms used in FASTPIPE include an algorithm for pressure and flow analysis, an algorithm for optimum design of pipe networks, and an algorithm for the optimum design of materials and devices for protecting utilities against freezing. The use of interactive design dialogue leads the user through a pipe distribution system design by requesting, at various stages, specific input while still allowing the user, at any point, to change the sequence. The package is comprised of two distinct separate programs, NETWORKOPTIMIZE (NETOPT), an interactive design of a cost effective network operating under steady state conditions, and ARCTIC, an interactive design of an optimal continuous or pulsed system. The package was used to design the optimal layout for the Broughton Island network and to determine the optimum power and insulation requirements for that system. The package is commercially available to dial-up terminals in most North American cities. (See also W81-01381) (Seigler-IPA)

8B. Hydraulics

APPROXIMATE ANALYSIS OF UNSTEADY LAMINAR FLOW,
RCA Research Center, Princeton, New Jersey.
D. Stavitsky, and E. Macagno.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 106, No HY12, p 1973-1980, December, 1980. 3 Fig, 4 Ref.

Descriptors: *Mathematical models, *Pipe flow, *Water pressure, Pressure conduits, Flow resistance, Fluid friction, Movement, Fluctuations, Engineering, Model studies, Hydraulics, Variability, Reynolds number, *Laminar flow, *Unsteady flow.

Many problems have been encountered with solutions of unsteady laminar flow of incompressible fluids in circular pipes due to varying pressure differences. Lengthy and cumbersome mathematical calculations often result when the Uchida or Szymanski equations are applied to this situation. An approximate model is proposed to simplify the calculations of unsteady flow, and the method is checked for validity with exact solution models. Results showed that errors introduced by the new technique are relatively small, while time savings in calculations are large when compared to exact solution methods. The solution for any pressure variation and any conduit cross-sectional shape for which uniform flow solutions are available can be listed in terms of one simple integral. The average friction coefficient may be obtained as a function of an average Reynolds number, the oscillatory mean pressure difference ratio, and the Stokes number. The proposed mathematical model allows any oscillatory flow in a conduit to be handled as steady flow when corrections are made for the average resistive force. (Geiger-FRC)

8C. Hydraulic Machinery

WIND GENERATED ELECTRIC POWER FOR SANITATION SERVICES -- A CASE STUDY,
Ellerbe Alaska, Fairbanks.
M. A. Crawford, and T. J. Bergin.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 89-104. 6 Fig.

Descriptors: *Alaska, *Wind power, *Power sources, *Cold regions, *Electric power production, Water wells, Water supply, Standby power, Design data, Project post-evaluation, Pumping, Cost analysis, Sanitary engineering, Public utilities, Water works.

The utilization of wind-generated electric power, battery power storage, water storage, single point gravity delivery in the small village of Council, Alaska, indicates that wind power systems are a very viable alternative to conventional diesel generator power sources in remote Alaskan villages in windy regions. Council is approximately 50 miles east-northeast of Nome and has approximately 30 permanent residents. A well was drilled in the center of the village and electric motor-driven submersible well pump was installed. A wind generator/battery prime electrical power system was installed for the design average wind speed of 19.3 km/h with a design calm period of four days. For a calm of more than four days a standby diesel generator is activated. A 6.4 m by 3.35 m building was constructed to accomodate the water storage tanks, well space heater, battery bank, inverter wind generator control panel, standby generator, and arctic entry vestibule. A project cost of $56,711 indicates that the wind generator and associated auxiliaries have an 8.7 year payback. Two small operational problems have been corrected and the system has withstood three blizzards, an

ice storm, and winds in excess of 129 km/h. (See also W81-01381) (Seigler-IPA)

8D. Soil Mechanics

USE OF A GEOTHERMAL MODEL IN NORTHERN MUNICIPAL PROJECTS,
EBA Engineering Consultants Ltd., Edmonton (Alberta).
D. Kent, and C. T. Hwang.
In: Proceedings - Second Symposium on Utilities Delivery in Northern Regions, March 19-21, 1979, Edmonton, Alberta, Report No EPS 3-WP-80-5, October, 1980, p 317-331. 6 Fig, 13 Ref.

Descriptors: *Geothermal studies, *Computer models, *Cold regions, *Pipelines, Freezing, Thawing, Computer programs, Soil temperature, Mathematical models, Data processing, Model studies, Water works, Meteorological data, Thermal properties.

A computerized geothermal model was developed for design feasibility study of northern pipelines. The model predicts the thermal response of the soil to changes in the thermal environment such as those resulting from a chilled or heated pipeline, construction of a building or embankment, or an alteration of ground surface properties. The model program has a thermal conduction code with a finite element formulation of the transient heat conduction mechanism of freezing and thawing. The ground surface heat exchange code simulates the heat exchange mechanism at the ground surface using meteorological data. The model was verified against measured temperatures from a Canadian Arctic Gas Pipeline facility. Excellent agreement was observed. Steps involved in model application include the collection of site information, selection of thermal properties, model calibration, and two-dimensional analysis. Case histories are given for model use with the Dawson City, Yukon water and sewer system and the Norman Wells water tank. (See also W81-01381) (Seigler-IPA)

TETON DAM-FOUNDATION GROUT TESTING PROGRAM,
Water and Power Resources Service, Denver, CO. Engineering and Research Center.
R. J. Bard.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-132417, Price codes: A03 in paper copy, A01 in microfiche. Report REC-ERC-79-2, December, 1979. 39 p, 29 Fig, 3 Tab, 8 Ref.

Descriptors: *Grouting, *Calcium chloride, *Dam failure, *Materials testing, Construction materials, Water-cement ratio, Dam construction, Dam foundations, Permeability, Mechanical properties, Strength of Materials, Hydration, *Teton Dam(ID).

After failure of Teton Dam in Idaho on June 5, 1976, a program was initiated to test foundation grouts similar to those used during construction of the dam. Grouts were made with the same cement, sand, bentonite, and calcium chloride used during construction, using mix proportions representative of grouts used, and mixed and cured as congruently to field conditions as possible. All mixes produced grouts exhibiting good hydration properties and good physical soundness. The inclusion of calcium chloride in grout mixes apparently did not cause formation of any compounds or substances which would be water soluble or erodible. Consideration should be given to specifying an upper limit of about 6% calcium chloride, by weight of cement, for sanded foundation grouts. Variations in the grout temperature at the end of the mixing period did not have adverse effects on grout. Although grouts tested were not impermeable, their relative permeability is low enough to preclude significant waterflow. Large amounts of bleeding, in grouts with high water to cement, and water to cement to sand ratios seem relatively inconsequential. (Moore-SRC)

8G. Materials

POLYESTER-RESIN ANCHOR CREEP STUDY,
Water and Power Resources Service, Denver, CO.
D. G. Miller.
Report GR-80-5, June, 1980. 16 p, 6 Fig, 3 Ref.

Descriptors: Binders, *Creep, *Rock bolts, *Materials testing, Adhesives, Loads(Forces), Bonding, Polyester resins, *Engineers estimates, Design criteria.

Mechanical rock bolt anchors have long been a weak link in obtaining full utilization of the strength of a rock bolt, and sometimes are totally unsatisfactory in certain types of rock. This research was initiated to determine the sustained and ultimate load carrying capacity of a polyester-resin type anchor. In the laboratory, a reinforcing steel rock bolt was anchored in a concrete cylinder using a polyester-resin cartridge type anchor. A load was applied to the rock bolt and anchor immediately following resin hardening and the system was monitored for load relaxation. Load data were gathered for 21 months. Early and sustained load carrying capabilities were impressive, with a load reduction of only 27% from the time of final retensioning to the end of periodically monitored readings 21 months later. The creep rate appeared to decrease as a function of both time and decreasing load. The anchorage remained in a tensioned state for the next 40 months, although the load was not monitored. After a total of 61 months the anchorage was tested to failure in a pull-out test. The strength of the resin bond exceeded that of the reinforcing steel bolt, which failed at a load of 229 kN (51,500 lbf). Resin anchors have been used on several Water and Power Resources Service Projects with great success. (Moore-SRC)
W81-01235

ST. LOUIS COUNTY STANDARDIZES PIPE AND PROCEDURES FOR RELIABILITY.
Water and Sewage Works, Vol 127, No 12, p 44-45, December, 1980. 3 Fig.

Descriptors: *Pipes, *Water conveyance, St. Louis County Water Company, Distribution systems, Joints(Connections), Metal pipes, Reliability, Specifications, Costs, Installation, Maintenance, Corrosion control.

Use of ductile iron pipe has shown many advantages in the St. Louis County Water Company system since this material was first installed 20 years ago. All standardized pipes and fittings couple with push-on gasketed joints. Pipe is palletized for easy shipment and storage. Corrosion is minimized by coating with cement and asphalt and wrapping with 8-mil polyethylene. Reinforced concrete squares are used as thrust blocks for 6 and 8 diameter pipes. The Company has a very small incidence of joint leaks, traceable to improper installation or corrosion. Ductile iron pipe can tolerate error in pipe laying procedures. Although costs vary with conditions, estimates for a 6 in iron pipe are as follows: first 400 feet, $12.68 per foot; next 600 feet, $12.24 per foot; over 1000 feet, $8.96 per foot. The cost of laying 8 in pipe adds $3.10 per foot to the figures for the 6 in pipe. Properties and costs of ductile iron and cast iron pipes are compared in a table. (Cassar-FRC)

CEDAR RIVER SOCKEYE SALMON PRODUCTION, 1980,
Washington Univ., Seattle. Fisheries Research Inst.
Q. J. Stober, and A. H. Hamalainen.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-156655, Price codes: A04 in paper copy, A01 in microfiche. Completion Report FRI-UW-8016, September, 1980. 59 p, 17 Fig, 8 Tab, 36 Ref, 1 Append. OWRT-A-103-WASH(1), 14-34-0001-0151.

Descriptors: *Sockeye salmon, *Incubation, *Washington, *Fish diseases, *Fish harvest, Fish handling facilities, Fish management, Salmon, Aquatic animals, Aquatic life, Fish, Salmonids, Commercial fish, Marine life, Marine animals, Sport fish, Wildlife, Infection, Hatching, Fish hatcheries, Fish populations.

The 1979 Cedar River escapement of sockeye salmon was estimated at 185,300 spawners that were the progeny of the 1975 brood year that had been impacted by the maximum flood on record. River discharge during the 1979 spawning season was regulated along the critical year flow curve, due to extant drought conditions. National egg survival was probably reduced by a moderate flood in mid-December. Fry estimated to have entered Lake Washington totalled 14,900,000 (including 5,100,000 sockeye fry estimated to have survived from 9,700,000 artifically-produced fry from the Washington Department of Fisheries incubation facility). The egg-to-fry survival rate for the entire run was 4.0%. The infection rate due to hematopoetic necrosis viral disease (first detected in fry in the incubation boxes and fyke net catches simultaneously, and in all returning adults sampled) declined to low level after all fry emigrated from the enhancement facilities. The 1976 and 1978 brood years were comparable, but 1978 escapement was doubled. Egg-to-fry survival was 8.1, 4.5, and 4.0 for the 1976, 1978, and 1979 brood years, respectively. The number of pre-emergent fry has increased with enhancement production. (Zielinski-IPA)

EVALUATIONS OF A BYPASS SYSTEM FOR JUVENILE SALMONIDS AT LITTLE GOOSE DAM,
National Marine Fisheries Service, Seattle, WA. Northwest and Alaska Fisheries Center.
J. R. Harmon, and D. L. Park.
Marine Fisheries Review, Vol 42, No 6, p 25-28, June, 1980. 2 Fig, 1 Tab, 5 Ref.

Descriptors: Dam design, Bypasses, *Chinook salmon, *Smolt, Conduits, *Dams, Fish migration, Fish behavior, Seasonal, Snake River, *Fish passages, Salmon, Fish guiding.

A new system for bypassing juvenile chinook salmon at the Little Goose Dam on the Snake River is proposed, and the existing system at Little Goose is evaluated. The orifice diameter, lighting, and placement in turbine intake slots of the test system were evaluated, along with overall system efficiency during the migration of chinook salmon and steelhead smolts in April and May of 1978. Existing six inch orifices were blocked off, and 12 inch fingerling transfer pipes with 8 to 10 inch orifices were tested. Marked fish were used to determine the efficiency of the orifices. Two orifices are needed for satisfactory passage due to varying current directions. Also, lighted orifices increase passage rates for salmon. A complete system at Little Goose would include north and south, 12 inch diameter lighted orifices in the downstream walls of the bulkhead slots. (Small-FRC)

WESTERN ENERGY AND LAND USE TEAM PUBLICATIONS: A BIBLIOGRAPHY WITH ABSTRACTS.
Fish and Wildlife Service, Fort Collins, CO. Western Energy and Land Use Team.
Report W/COAL-80/W28, October, 1980. 55 p.

Descriptors: *Bibliographies, *Land use, *Wildlife, *Water utilization, Environment, Abstracts, Documentation, Water resources, Energy resources.

This bibliography contains an annotated list of Biological Service Program publications produced or sponsored by the Western Energy and Land Use Team and included in the FWS/OBS Publication Series. The Biological Services Program is responsible for the development and dissemination of information pertaining to fish and wildlife resources and habitats, while the Western Energy and Land Use Team is the Service's major technical research and development organization for the study of Western land and water use. Publications are listed in the order of their FWS/OBS numbers. Each bibliographic entry contains ordering information and a brief abstract. There are five separate indices: author index, corporate author index, funding source index, geographic index, and keyword subject index. The bibliography includes 87 publications.
W81-01227

SUMMARIES OF RIPARIAN AND STREAM ALTERATION STUDIES COMPLETED BY THE EASTERN ENERGY AND LAND USE TEAM.
Fish and Wildlife Service, Kearneysville, WV. Eastern Energy and Land Use Team.
Report, July, 1980. 44 p.

Descriptors: *Wildlife, *Bibliographies, *Stream improvement, Environmental effects, Abstracts, Channel improvement, Flood control, Fish, Vegetation, Bank stabilization, Water resources development.

The Fish and Wildlife Service began funding stream alteration and riparian studies in FY'73. This bibliography provides abstracts or executive summaries for studies completed by the Eastern Energy and Land Use Team through 1980 pertaining to the impact of stream channelization, bank stabilization, water level changes, gravel removal, and water resources development on vegetation, fish and wildlife. Thirty-four publications are included in this bibliography. (Moore-SRC)

TAPPING DRINKING WATER DATA: A PROTOTYPE SYSTEM,
Michigan Univ., Ann Arbor.
R. A. Deininger, R. P. Thomas, and R. M. Clark.
Journal of the American Water Works Association, Vol 72, No 11, Part 1, p 600-603, November, 1980. 12 Fig, 4 Ref.

Descriptors: *Water quality, *Potable water, *Data storage and retrieval, *Michigan University, Public utilities, Data collections, Documentation.

A prototype data analysis and management system developed by the University of Michigan and the EPA Drinking Water Research Division enables a user to search for data on the water quality of U.S. utilities. The data base, current to 1977, presently contains information on 45 water quality parameters in 1000 public water supplies. The inquiry language, designed for user convenience, resembles English and is used in an interactive, conversational form. Typical questions which may be answered by the system are as follows: What percentage of water supplies contain mercury from 0 to .002 mg/liter. How many New Jersey water supplies exceed the standard for nitrate, 10 mg/liter. How many suppliers have information on organics. (Cassar-FRC)

W81-01404 5F

Waterworks Systems, Yellowknife, Northwest Territories,
W81-01406 5F

New Approaches to Water and Sewer Services in Permafrost Area -- Norman Wells, N.W.T.,
W81-01411 5F

Modification of the Tide in the Canadian Arctic by an Ice Cover,
W81-01412 2C

CARDIOVASCULAR DISEASE
Does Drinking Water Hardness Affect Cardiovascular Disease,
W81-01362 5C

CARP
The Effects and Control of Algal Blooms in Fish Ponds,
W81-01418 5C

CENTER HILL LAKE (TN)
A Three-Dimensional Field Evaluation and Analysis of Water Quality in Two Reservoirs,
W81-01377 2H

CENTRIFUGATION
Design Data for Gravity Thickeners,
W81-01308 5E

CHEMICAL ANALYSIS
A Field Evaluation of the HASL Wet-Dry Deposition Collector,
W81-01351 7B

CHEMICAL PRECIPITATION
A Design Study of Biochemical Combined Waste water Treatment Plant,
W81-01311 5D

CHEMICAL WASTES
Distribution of Polychlorinated Biphenyls in the Fort Edward, New York, Water System,
W81-01256 5B

CHEMISTRY OF PRECIPITATION
Transport of Trace Elements in Ecosystems of the Barhalde Watershed in the Southern Black Forest,
W81-01278 5B

CHEROKEE LAKE (TN)
A Three-Dimensional Field Evaluation and Analysis of Water Quality in Two Reservoirs,
W81-01377 2H

CHINOOK SALMON
Evaluations of a Bypass System for Juvenile Salmonids at Little Goose Dam,
W81-01300 8I

CHLORIDE
Movement of Chloride in a Soil with Variable Charge Properties: II. Sanitary Landfill Leachate,
W81-01324 5E

CHLORIDES
Movement of Chloride in a Soil with Variable Charge Properties: I. Chloride Systems,
W81-01323 5E

CHLORINATED HYDROCARBON PESTICIDES
An Evaluation of Hazardous Chemicals in Lake Ontario During IFYGL,
W81-01226 5C

Organochlorine Compounds in Aquatic Environments,
W81-01250 5A

CHLORINATION
Chlorine Resistance of Poliovirus Isolants Recovered from Drinking Water,
W81-01248 5F

A Note on the Sensitivity of Chlorine-Stressed Bifidobacteria to Nalidixic Acid,
W81-01290 5A

Chloroform Production from the Chlorination of Aquatic Humic Material: The Effect of Molecular Weight, Environment and Season,
W81-01337 5F

CHLORPYRIFOS
Loss of Chlorphyrifos in Pond Water: Examination of Results Using Three Simple Mathematical Models,
W81-01366 5B

CLAMS
Use of Selected Freshwater Bivalves for Monitoring Organochlorine Pesticide Residues in Major Mississippi Stream Systems, 1972-73,
W81-01303 5B

CLIMATIC DATA
Error Detection System for Climatic and Hydrologic Data,
W81-01276 7A

COLD REGIONS
Proceedings -- Second Symposium on Utilities Delivery in Northern Regions.
W81-01381 5F

Evolution of the Water and Sanitation Policy and Program in the Northwest Territories,
W81-01382 6E

Programming, Design and Construction of Utilities in Greenland,
W81-01383 5F

Water and Energy Conservation Alternatives for the North,
W81-01384 3D

Wind Generated Electric Power for Sanitation Services -- A Case Study,
W81-01385 8C

Waste Heat Utilization through Soil Heating,
W81-01386 3C

Appropriate Technologies for Water Supplies and Sanitation in Northern Communities,
W81-01387 6B

Studies of Utility Construction in Cold Regions,
W81-01388 8A

Township of Temagami: One Alternative for Servicing a Northern Community,
W81-01389 5D

Critical Evaluation of Insulated Shallow Buried Pipe Systems in the Northwest Territories,
W81-01390 8A

Pre-Insulated High Density Polyethylene Piping -- The Evolution of a Northern Achievement,
W81-01391 8A

Introduction to Fire Protection in the North,
W81-01392 6B

Fire Protection in the North,
W81-01393 6B

Fire Protection Considerations in Remote, Cold Regions Communities,
W81-01394 6B

Fire Protection in Isolated Northern Communities,
W81-01395 6B

The Application of Skin Effect Current Tracing for Freeze Protection of Water Systems,
W81-01398 8A

Electric Heat Tracing and Energy Conservation for Northern Installations,
W81-01399 8A

Thawing of Frozen Water Services,
W81-01400 8A

Use of a Geothermal Model in Northern Municipal Projects,
W81-01401 8D

A Water Supply System for the World's Most Northern Permanent Community,

Solving Snow-Drifting Problems at Baker Lake, N.W.T., Using Snow-Modelling Techniques,
W81-01405 6B

Waterworks Systems, Yellowknife, Northwest Territories,
W81-01406 5F

Rural Schools Prototype Analysis,
W81-01408 6A

Water and Sewer Utilities for Barrow, Alaska,
W81-01410 6A

New Approaches to Water and Sewer Services in Permafrost Area -- Norman Wells, N.W.T.,
W81-01411 5F

COLIFORMS
Relative Effects of Bacterial and Protozoan Predators on Survival of Escherichia Coli in Estuarine Water Samples,
W81-01247 5C

Coliphages as Indicators in a Treatment Plant,
W81-01352 5A

Bacteriological Monitoring of Pollution in Shellfish: Methodological Evaluation,
W81-01371 5A

Indicator-Organism Persistence in Acid-Mine-Water Environments,
W81-01378 5B

COMPUTER MODELS
Use of a Geothermal Model in Northern Municipal Projects,
W81-01401 8D

COMPUTER PROGRAMS
Error Detection System for Climatic and Hydrologic Data,
W81-01276 7A

Water Distribution Pipe Networks for Arctic Settlements,
W81-01403 8A

CONFERENCES
Proceedings -- Second Symposium on Utilities Delivery in Northern Regions.
W81-01381 5F

CONSTRUCTION COSTS
Economical Considerations on Local or Centralized Waste water Treatment Systems,
W81-01319 6B

Statistical Cost Function Developed for Sewer Lines,
W81-01342 5D

CONTROLLED DRAINAGE
Crop Water Supplied by Controlled and Reversible Drainage,
W81-01277 2D

COPPER
Accumulation of Copper in Fluvial Sediments and Yellow Water Lillies (Nuphar Lutea) at Varying Distances from a Metal Processing Plant,
W81-01252 5B

CORN
Yield Response of Corn Related to Soil Moisture,
W81-01274 3F

COST ANALYSIS
Stormwater Management Technology Systems Demonstration in the City of St. Thomas.
W81-01211 5G

COST-BENEFIT ANALYSIS
Extended Use of Treated Municipal Waste water by the Buckeye Irrigation Company: A Documentation of Effects,
W81-01208 3C

An Empirical Application of a Model for Estimating the Recreation Value of Instream Flow,
W81-01210 6B

Water Quality and Human Activities: A Monitoring and Modeling Effort in Finland,
W81-01326 6B

COSTS
Low Cost of Provision of Anaerobic Digestion,
W81-01312 5E

Trade Effluent Control in London,
W81-01317 5D

COTTON
Effects of Natural Gas Price Increases on Texas High Plains Irrigation, 1976-2025,
W81-01222 6B

CREEP
Polyester-Resin Anchor Creep Study,
W81-01235 8G

CROP RESPONSE
Yield Response of Corn Related to Soil Moisture,
W81-01274 3F

Effect of Varying Mg/Ca Ratio and Electrolyte Concentration in the Irrigation Water on the Soil Properties and Growth of Wheat,
W81-01305 5C

Preliminary Investigations into the Effects of Refinery Waste Water, and the Single Effect of its Major Pollutants on Commercially Interesting Crops,
W81-01315 3C

CYANOPHYTA
The Effects and Control of Algal Blooms in Fish Ponds,
W81-01418 5C

CYTOLOGICAL STUDIES
Cytosome Morphogenesis in Nerve Cells and Lateral Cilio-Inhibition in the Mussel, Mytilus Edulis,
W81-01268 7B

DAM CONSTRUCTION
The State of the Nile Environment: An Overview,
W81-01327 5C

DAM DESIGN
Hydrologic Investigation, Design, and Construction of Flood Control Structures, Copperhill, Tennessee,
W81-01301 4A

DAM FAILURE
Teton Dam-Foundation Grout Testing Program,
W81-01237 8F

DAMS
Evaluations of a Bypass System for Juvenile Salmonids at Little Goose Dam,
W81-01300 8I

DATA COLLECTION
A Comparative Study of Microwave Radiometer Observations over Snowfields with Radioactive Transfer Model Calculations,
W81-01283 2C

DATA COLLECTIONS
An Evaluation of 'A Procedure For Describing Fish and Wildlife in Pennsylvania'.
W81-01231 6B

DATA PROCESSING
Error Detection System for Climatic and Hydrologic Data,
W81-01276 7A

DATA STORAGE AND RETRIEVAL
Tapping Drinking Water Data: A Prototype System,
W81-01289 10D

DELAWARE BAY
Reexamination of the Water Chemistry and Planktology of a Delaware Tidal Stream as Related to its Flushing Characteristics,
W81-01375 2L

DEUTERIUM
Determination of Deuterium/Hydrogen Ratios in Natural Waters by Fourier Transform Nuclear Magnetic Resonance Spectrometry,
W81-01244 7B

Mass Spectrometric Determination of Deuterium in Water at Natural Levels,
W81-01246 5A

DIATOMACEOUS EARTH
Large-Scale Ozone-de Filtration: An Industry First,
W81-01288 5F

DIATOMS
Seasonal Fluctuations of Major Diatom Species at Five Stations Across Lake Michigan, May 1970-October 1972,
W81-01223 5C

DIFFUSION
Use of Mathematical Models to Derive a System for Calculating the Acceptance Capacity of Marine Coastal Waters. (Utilisation de Modeles Mathematiques dans la Mise au Point d'une Methodologie de Calcul de la Capacite d'Acceptation du Milieu Recepteur Littoral Marin.),
W81-01321 5E

DISPERSION
Dispersion and Weathering of Chemically Treated Crude Oils on the Ocean,
W81-01259 5E

Waikato River Pollutant Flushing Rates,
W81-01299 5B

DISSOLVED SOLIDS
Characterization of Storm Runoff in Las Vegas Valley, Nevada,
W81-01205 4C

DOMESTIC WASTES
Water Recycling with Solids and Foam Removal,
W81-01424 5D

DOMESTIC WATER
Domestic Water Consumption in Urban Areas: A Case Study in Ibadan City, Nigeria,
W81-01333 6D

DRAINAGE
Sediment Production of Alluvial Channels in Response to Base Level Lowering,
W81-01269 2J

DRIP IRRIGATION
Multiple Chamber Drip Irrigation Hose,
W81-01417 3F

DYES
Waikato River Pollutant Flushing Rates,
W81-01299 5B

ECOLOGICAL DISTRIBUTIONS
An Evaluation of 'A Procedure For Describing Fish and Wildlife in Pennsylvania'.
W81-01231 6B

EFFLUENTS
Water Hyacinths for Waste water Treatment,
W81-01285 5D

Trade Effluent Control in London,
W81-01317 5D

EGYPT
Indigenous Resources and Water Supply Management,
W81-01329 4B

ELECTRIC POWER PRODUCTION
Wind Generated Electric Power for Sanitation Services -- A Case Study,
W81-01385 8C

ELECTRICAL MINING
Electric Heat Tracing and Energy Conservation for Northern Installations,
W81-01399 8A

EMPLOYMENT
Indigenous Resources and Water Supply Management,
W81-01329 4B

ENERGY CONSERVATION
Electric Heat Tracing and Energy Conservation for Northern Installations,
W81-01399 8A

ENGINEERS ESTIMATES
Polyester-Resin Anchor Creep Study,
W81-01235 8G

ENTRAINMENT
Movements of Lake Trout in Twin Lakes, Colorado, in Relation to the Mt. Elbert Pumped-Storage Powerplant,
W81-01239 5C

ENVIRONMENTAL EFFECTS
Opportunities for U.S. Fish and Wildlife Service Initiatives Related to Uranium Mining and Milling in the Western United States,
W81-01216 5B

Sandia's Activities in Uranium Mill Tailings Remedial Action,
W81-01217 5B

Effects of Alterations to Low Gradient Reaches of Utah Streams,
W81-01224 6G

Western States Inventory of Low-Head Hydroelectric Sites, Volume 2, Appendix D, Environmental Screening.
W81-01232 6G

Effects of Alterations to Low Gradient Reaches of Utah Streams: Summary,
W81-01234 6G

The State of the Nile Environment: An Overview,
W81-01327 5C

Determining Impact of Irrigation on Groundwater,
W81-01370 4B

ENVIRONMENTAL ENGINEERING
Waikato River Pollutant Flushing Rates,
W81-01299 5B

EQUATIONS
Which Plant Expansion is the Most Urgent One in a River System and How to Develop a Priority List,
W81-01320 6A

EQUITY
An Equitable Approach to Pollution Control with Particular Reference to the Thames Estuary,
W81-01313 5C

EROSION
Characteristics of Eroded Sediment.
W81-01275 2J

EROSION RATES
Erosion by Circular Wall Jets in Cross Flow,
W81-01350 4D

ESTUARIES
The Significance of the Entrapment Zone Location to the Phytoplankton Standing Crop in the San Francisco Bay-Delta Estuary,
W81-01225 2L

Relative Effects of Bacterial and Protozoan Predators on Survival of Escherichia Coli in Estuarine Water Samples,
W81-01247 5C

Distribution of Oil Pollution Residues,
W81-01295 [illegible]

An Equitable Approach to Pollution Control with Particular Reference to the Thames Estuary,
W81-01313 5C

Linear Alkylbenzene Sulfonates in River, Estuary and Bay Water,
W81-01348 5B

EUPHOTIC ZONE
The Significance of the Entrapment Zone Location to the Phytoplankton Standing Crop in the San Francisco Bay-Delta Estuary,
W81-01225 2L

EUTROPHICATION
Seasonal Fluctuations of Major Diatom Species at Five Stations Across Lake Michigan, May 1970-October 1972,
W81-01223 5C

EVALUATION
A Post Audit Evaluation of Methodology for Wild and Scenic River Development and Management, the Clearwater River, Idaho: A Case Study,
W81-01379 6B

A Post Audit Evaluation of Methodology for Wild and Scenic River Development and Management, The Clearwater River, Idaho: A Case Study of Public Involvement Practices,
W81-01380 6B

FACILITIES
Rural Schools Prototype Analysis,
W81-01408 6A

FARM WASTES
Dairy Open Lot and Lagoon-Irrigated Pasture Runoff Quantity and Quality,
W81-01272 3C

Modelling Groundwater Contamination from Land-Applied Swine Waste,
W81-01273 7B

Temporary Pipeline Averts Water Quality Emergency.
W81-01284 5G

FASTPIPE
Water Distribution Pipe Networks for Arctic Settlements,
W81-01403 8A

FEASIBILITY
Which Plant Expansion is the Most Urgent One in a River System and How to Develop a Priority List,
W81-01320 6A

FERMENTATION
Evolution of Primary Sludge During Thickening,
W81-01309 5E

FILTRATION
Capture of Latex Beads, Bacteria, Endotoxin, and Viruses by Charge-Modified Filters,
W81-01240 5D

Large-Scale Ozone-de Filtration: An Industry First,
W81-01288 5F

Anaerobic Contact Filter Process: A Suitable Method for the Treatment of Vegetable Tanning Effluents,
W81-01359 5D

The Use of Ultra High Rate Dual-Medium Filtration and Dissolved-Air Flotation for Maintenance of Consistent Effluent Standards at High Loadings,
W81-01360 5D

FINLAND
Accumulation of Copper in Fluvial Sediments and Yellow Water Lillies (Nuphar Lutea) at Varying Distances from a Metal Processing Plant,
W81-01252 5B

Water Quality and Human Activities: A Monitoring and Modeling Effort in Finland,
W81-01326 6B

FIRE PROTECTION
Introduction to Fire Protection in the North,
W81-01392 6B

Fire Protection in the North,
W81-01393 6B

Fire Protection Considerations in Remote, Cold Regions Communities,
W81-01394 6B

Fire Protection in Isolated Northern Communities,
W81-01395 6B

FISH
Effect of the Warm Water Discharge from a Power Station on Fish Populations in the River Trent,
W81-01286 5C

Identification of Hazardous Organic Chemicals in Fish from the Ashtabula River, Ohio, and Wabash River, Indiana,
W81-01292 5A

FISH BEHAVIOR
Movements of Lake Trout in Twin Lakes, Colorado, in Relation to the Mt. Elbert Pumped-Storage Powerplant,
W81-01239 5C

FISH DISEASES
Cedar River Sockeye Salmon Production, 1980,
W81-01206 8I

FISH HARVEST
Cedar River Sockeye Salmon Production, 1980,
W81-01206 8I

FISH PASSAGES
Evaluations of a Bypass System for Juvenile Salmonids at Little Goose Dam,
W81-01300 8I

FISH PONDS
The Effects and Control of Algal Blooms in Fish Ponds,
W81-01418 5C

FISH POPULATIONS
Effects of Alterations to Low Gradient Reaches of Utah Streams,
W81-01224 6G

Effects of Alterations to Low Gradient Reaches of Utah Streams: Summary,
W81-01234 6G

FIVE-YEAR PLANS
Five-Year Water Resources Research and Development Plan, Goals and Objectives, 1982-1986.
W81-01207 6E

FIVE-YEAR PLANS (PACIFIC SW REGION)
Regional Five-Year (1982-1987) Water Resources Research: Goals and Objectives.
W81-01209 6E

FLOCCULATION
The Treatment of Woolscour Effluent - I. Removal of Colloidal Dirt,
W81-01413 5D

FLOOD CONTROL
Hydrologic Investigation, Design, and Construction of Flood Control Structures, Copperhill, Tennessee,
W81-01301 4A

FLOOD FLOW
Review and Evaluation of Urban Flood Flow Frequency Procedures,
W81-01221 4C

FLOOD FREQUENCY
Review and Evaluation of Urban Flood Flow Frequency Procedures,
W81-01221 4C

FLOTATION
Fluid Mechanics-Foam Flotation Interactions,
W81-01280 5D

The Use of Ultra High Rate Dual-Medium Filtration and Dissolved-Air Flotation for Maintenance of Consistent Effluent Standards at High Loadings,
W81-01360 5D

FLUID MECHANICS
Fluid Mechanics-Foam Flotation Interactions,
W81-01280 5D

FLURIDONE
Gas Chromatographic Determination of Fluridone Aquatic Herbicide and its Major Metabolite in Fish,
W81-01293 5A

FLUVIAL SEDIMENTS
Accumulation of Copper in Fluvial Sediments and Yellow Water Lillies (Nuphar Lutea) at Varying Distances from a Metal Processing Plant,
W81-01252 5B

FONTINALIS
Development of a Wintertime Biomonitor for Heavy Metals in Flowing Waters,
W81-01374 5B

FOOD PROCESSING INDUSTRY
Treatment and Disposal of Sugarbeet Processing Waste Water by Irrigation,
W81-01220 3C

Liquid Waste Reduction Technology for Industries Demonstrated by the Treatment of Sugar Beet Waste Water,
W81-01307 5D

FREEZING
The Application of Skin Effect Current Tracing for Freeze Protection of Water Systems,
W81-01398 8A

Thawing of Frozen Water Services,
W81-01400 8A

Thermodynamic Analysis of the Water Distribution System in Inuvik, NWT,
W81-01402 8A

FULVIC ACIDS
Chloroform Production from the Chlorination of Aquatic Humic Material: The Effect of Molecular Weight, Environment and Season,
W81-01337 5F

GAGING STATIONS
Surface Water Data, Atlantic Provinces, 1979.
W81-01214 7A

Surface Water Data, Yukon and Northwest Territories, 1979.
W81-01215 7A

GAS CHROMATOGRAPHY
The Chromatographic and GC/MS Analysis of Organic Priority Pollutants in Water,
W81-01294 5A

GASOLINE
Field and Laboratory Methods for Investigating a Marine Gasoline Spill,
W81-01260 5A

GEOTHERMAL STUDIES
Use of a Geothermal Model in Northern Municipal Projects,
W81-01401 8D

GRAINS (CROPS)
Effects of Natural Gas Price Increases on Texas High Plains Irrigation, 1976-2025,
W81-01222 6B

GREAT BEAR LAKE (CANADA)
Attached and Planktonic Algal Communities in Some Inshore Areas of Great Bear Lake,
W81-01253 2H

GREENLAND
Programming, Design and Construction of Utilities in Greenland,
W81-01383 5F

GROUNDWATER
Determining Impact of Irrigation on Groundwater,
W81-01370 4B

Hawaiian Groundwater Geology and Hydrology, and Early Mathematical Models,
W81-01376 2A

GROUTING
Teton Dam-Foundation Grout Testing Program,
W81-01237 8F

HABITAT IMPROVEMENT
Water Bank Program, 1972 Through September 30, 1979.
W81-01229 5G

HARDNESS (WATER)
Does Drinking Water Hardness Affect Cardiovascular Disease,
W81-01362 5C

HAWAII
Hawaiian Groundwater Geology and Hydrology, and Early Mathematical Models,
W81-01376 2A

HEAT TRACING
Electric Heat Tracing and Energy Conservation for Northern Installations,
W81-01399 8A

HEATED PIPELINES
The Application of Skin Effect Current Tracing for Freeze Protection of Water Systems,
W81-01398 8A

Electric Heat Tracing and Energy Conservation for Northern Installations,
W81-01399 8A

HEAVY METALS
An Evaluation of Hazardous Chemicals in Lake Ontario During IFYGL,
W81-01226 5C

Results of a Limnological Study of Lake Pocasse, South Dakota,
W81-01238 5C

Handling Hazardous Wastes,
W81-01263 5E

Note on Heavy Metal Concentration in the Aquatic Environment of the Kitakyushu District in Japan, 1976-1977,
W81-01338 5B

Effect of Nitrification on Movement of Trace Metals in Soil Columns,
W81-01365 5E

Heavy Metal Inputs to Mississippi Delta Sediments--A Historical View,
W81-01373 5B

Development of a Wintertime Biomonitor for Heavy Metals in Flowing Waters,
W81-01374 5B

HONG KONG
The Development of Marine Pollution Control in Hong Kong,
W81-01349 5E

HUMIC ACIDS
Chloroform Production from the Chlorination of Aquatic Humic Material: The Effect of Molecular Weight, Environment and Season,
W81-01337 5F

HYDROELECTRIC PLANTS
Western States Inventory of Low-Head Hydroelectric Sites, Volume 2, Appendix D, Environmental Screening.
W81-01232 6G

HYDROGEOLOGY
Hawaiian Groundwater Geology and Hydrology, and Early Mathematical Models,
W81-01376 2A

ICE COVER
Modification of the Tide in the Canadian Arctic by an Ice Cover,
W81-01412 2C

ICE-WATER INTERFACES
Ice Sheet Formation from Deposited Snow in Highly Acidic Lake Katanuma,
W81-01264 2C

INCINERATION
Energy Conservation Units Replace Oil at Southerly Waste water Treatment Center,
W81-01336 5E

Fluidized-Bed Incineration of Sewage Sludge at Esher, 1976-1978,
W81-01344 5E

INCUBATION
Cedar River Sockeye Salmon Production, 1980,
W81-01206 8I

INDUSTRIAL WASTE
The Treatment of Woolscour Effluent - I. Removal of Colloidal Dirt,
W81-01413 5D

INDUSTRIAL WASTES
Trade Effluent Control in London,
W81-01317 5D

Industrial Waste Control Procedures in the City of Los Angeles, California, U.S.A.,
W81-01318 5D

Note on Heavy Metal Concentration in the Aquatic Environment of the Kitakyushu District in Japan, 1976-1977,
W81-01338 5B

Detrimental Effects of Pharmaceutical Industrial Waste on Microorganisms,
W81-01353 5C

Case Studies of Acrylamide Pollution Resulting from the Industrial Use of Polyacrylamides,
W81-01355 5B

INDUSTRIAL WATER
Preliminary Investigations into the Effects of Refinery Waste Water, and the Single Effect of its Major Pollutants on Commercially Interesting Crops,
W81-01315 3C

INPUT-OUTPUT ANALYSIS
Input-Output Modeling for Facility Level Water Planning,
W81-01331 6A

INSECTS
Potential Significance of Insects in the Removal of Contaminants from Aquatic Systems,
W81-01354 5B

INTER-BASIN TRANSFER
A Systems Approach to the Study of Interbasin Water Transfers: The Partial Diversion of the USSR's Northern Rivers Flow into the Volga,
W81-01335 6A

INUVIK
Thermodynamic Analysis of the Water Distribution System in Inuvik, NWT,
W81-01402 8A

INVERTEBRATES
Effects of Alterations to Low Gradient Reaches of Utah Streams,
W81-01224 6G

Effects of Alterations to Low Gradient Reaches of Utah Streams: Summary,
W81-01234 6G

ION EXCHANGE
Simulation of Flow Patterns and Ion-Exchange in Soil Percolation Experiments. Part I. Tracer Experiments and Flow Model,
W81-01415 2G

IRRIGATION
Treatment and Disposal of Sugarbeet Processing Waste Water by Irrigation,
W81-01220 3C

Effects of Natural Gas Price Increases on Texas High Plains Irrigation, 1976-2025,
W81-01222 6B

Multiple Chamber Drip Irrigation Hose,
W81-01417 3F

IRRIGATION CANALS
Development of Improved Water Management Practices in Pakistan,
W81-01328 6A

IRRIGATION EFFICIENCY
Crop Water Supplied by Controlled and Reversible Drainage,
W81-01277 2D

IRRIGATION PRACTICES
Extended Use of Treated Municipal Waste water by the Buckeye Irrigation Company: A Documentation of Effects,
W81-01208 3C

Yield Response of Corn Related to Soil Moisture,
W81-01274 3F

Crop Water Supplied by Controlled and Reversible Drainage,
W81-01277 2D

Determining Impact of Irrigation on Groundwater,
W81-01370 4B

IRRIGATION PROGRAMS
Indigenous Resources and Water Supply Management,
W81-01329 4B

IRRIGATION WATER
Dairy Open Lot and Lagoon-Irrigated Pasture Runoff Quantity and Quality,
W81-01272 3C

Effect of Varying Mg/Ca Ratio and Electrolyte Concentration in the Irrigation Water on the Soil Properties and Growth of Wheat,
W81-01305 5C

ISOTOPE STUDIES
A Simple Method Using a Disposable Syringe to Prepare Samples for Delta 018 Measurements in Water Samples,
W81-01241 5A

Determination of Deuterium/Hydrogen Ratios in Natural Waters by Fourier Transform Nuclear Magnetic Resonance Spectrometry,
W81-01244 7B

ITALY
Bacteriological Monitoring of Pollution in Shellfish: Methodological Evaluation,
W81-01371 5A

KINETICS
Kinetics of Pure Oxygen Activated Sludge,
W81-01297 5D

LAGOONS
Upgrading Lagoon Effluents with Rock Filters,
W81-01298 5D

LAKE APOPKA (FL)
Nutrient Removal from Drainage Waters with Systems Containing Aquatic Macrophytes,
W81-01270 5D

LAKE ICE
Ice Sheet Formation from Deposited Snow in Highly Acidic Lake Katanuma,
W81-01264 2C

LAKE MICHIGAN
Seasonal Fluctuations of Major Diatom Species at Five Stations Across Lake Michigan, May 1970-October 1972,
W81-01223 5C

Determination of Atmospheric Phosphorus Addition to Lake Michigan,
W81-01236 5B

LAKE ONTARIO
An Evaluation of Hazardous Chemicals in Lake Ontario During IFYGL,
W81-01226 5C

LAKE POCASSE (SD)
Results of a Limnological Study of Lake Pocasse, South Dakota,
W81-01238 5C

LAKE RESTORATION
Index to Evaluate Lake Restoration,
W81-01296 5G

LAKE SUPERIOR
Development of a Wintertime Biomonitor for Heavy Metals in Flowing Waters,
W81-01374 5B

LAKE TROUT
Movements of Lake Trout in Twin Lakes, Colorado, in Relation to the Mt. Elbert Pumped-Storage Powerplant,
W81-01239 5C

LAKES
Attached and Planktonic Algal Communities in Some Inshore Areas of Great Bear Lake,
W81-01253 2H

Applications of Landsat Data for Estimating Phytoplankton Production in Lake Chad (Africa). (Application des Donnees Landsat a l'Estimation de la Production du Phytoplancton dans le Lac Tchad),
W81-01262 2H

Measurements of Underwater Spectral Irradiance in Lake Biwa,
W81-01265 2H

Limnological Studies on Inorganic Acid Lakes in Japan (In Japanese),
W81-01266 2H

Index to Evaluate Lake Restoration,
W81-01296 5G

Phosphorus Release from Sediments from Lake Carl Blackwell, Oklahoma,
W81-01339 2H

LAMINAR FLOW
Approximate Analysis of Unsteady Laminar Flow,
W81-01367 8B

LAND USE
Western Energy and Land Use Team Publications: A Bibliography with Abstracts.
W81-01227 10C

LANDFILLS
Handling Hazardous Wastes,
W81-01263 5E

Movement of Chloride in a Soil with Variable Charge Properties: I. Chloride Systems,
W81-01323 5E

Movement of Chloride in a Soil with Variable Charge Properties: II. Sanitary Landfill Leachate,
W81-01324 5E

LEACHATE
Movement of Chloride in a Soil with Variable Charge Properties: II. Sanitary Landfill Leachate,
W81-01324 5E

LEACHING
Movement of Chloride in a Soil with Variable Charge Properties: I. Chloride Systems,
W81-01323 5E

Effect of Nitrification on Movement of Trace Metals in Soil Columns,
W81-01365 5E

LIGHT QUALITY
Measurements of Underwater Spectral Irradiance in Lake Biwa,
W81-01265 2H

LIMNOLOGY
Results of a Limnological Study of Lake Pocasse, South Dakota,
W81-01238 5C

Limnological Studies on Inorganic Acid Lakes in Japan (In Japanese),
W81-01266 2H

LOS ANGELES AQUEDUCT
Mono Lake, California: Saving a Lake or Serving a City,
W81-01255 3D

LOUISIANA
Isolation of 01 Servovars of Vibrio Cholerae from Water by Serologically Specific Method,
W81-01282 5A

MASS SPECTROMETY
Mass Spectrometric Determination of Deuterium in Water at Natural Levels,
W81-01246 5A

MATERIALS TESTING
Polyester-Resin Anchor Creep Study,
W81-01235 8G

Teton Dam-Foundation Grout Testing Program,
W81-01237 8F

MATHEMATICAL MODELS
Fluid Mechanics-Foam Flotation Interactions,
W81-01280 5D

Distribution of Oil Pollution Residues,
W81-01295 5B

Modelling the Dynamics of the Activated Sludge Waste water Treatment Process in Terms of the Carbon Variable,
W81-01347 5D

Approximate Analysis of Unsteady Laminar Flow,
W81-01367 8B

Stochastic Generation of Annual Streamflows,
W81-01369 6A

Hawaiian Groundwater Geology and Hydrology, and Early Mathematical Models,
W81-01376 2A

A Three-Dimensional Field Evaluation and Analysis of Water Quality in Two Reservoirs,
W81-01377 2H

Simulation of Flow Patterns and Ion-Exchange in Soil Percolation Experiments. Part I. Tracer Experiments and Flow Model,
W81-01415 2G

MATHEMATICAL STUDIES
Index to Evaluate Lake Restoration,
W81-01296 5G

METALS
Poly(Acrylamidoxime) Resin for Determination of Trace Metals in Natural Waters,
W81-01243 5A

Transport of Trace Elements in Ecosystems of the Barhalde Watershed in the Southern Black Forest,
W81-01278 5B

Reverse Osmosis Separation of Thiosalts from Mining Effluents,
W81-01281 5D

Determination of Metals in Sewage Effluents,
W81-01356 5A

METEORIC WATER
Process and Plant for the Recovery of Water from Humid Air,
W81-01425 2K

METHODOLOGY
An Evaluation of 'A Procedure For Describing Fish and Wildlife in Pennsylvania'.
W81-01231 6B

Use of Mathematical Models to Derive a System for Calculating the Acceptance Capacity of Marine Coastal Waters. (Utilisation de Modeles Mathematiques dans la Mise au Point d'une Methodologie de Calcul de la Capacite d'Acceptation du Milieu Recepteur Littoral Marin.),
W81-01321 5E

MICHIGAN UNIVERSITY
Tapping Drinking Water Data: A Prototype System,
W81-01289 10D

MICROORGANISMS
Capture of Latex Beads, Bacteria, Endotoxin, and Viruses by Charge-Modified Filters,
W81-01240 5D

Detrimental Effects of Pharmaceutical Industrial Waste on Microorganisms,
W81-01353 5C

MINE WASTES
Opportunities for U.S. Fish and Wildlife Service Initiatives Related to Uranium Mining and Milling in the Western United States,
W81-01216 5B

Reverse Osmosis Separation of Thiosalts from Mining Effluents,
W81-01281 5D

MINNESOTA
Five-Year Water Resources Research and Development Plan, Goals and Objectives, 1982-1986.
W81-01207 6E

MISSISSIPPI DELTA
Heavy Metal Inputs to Mississippi Delta Sediments--A Historical View,
W81-01373 5B

MODEL STUDIES
Methods for Deriving Optimal Operating Rules for Multiple Reservoir Systems,
W81-01204 6A

An Empirical Application of a Model for Estimating the Recreation Value of Instream Flow,
W81-01210 6B

Stormwater Management Technology Systems Demonstration in the City of St. Thomas.
W81-01211 5G

Review and Evaluation of Urban Flood Flow Frequency Procedures,
W81-01221 4C

Water Quality and Human Activities: A Monitoring and Modeling Effort in Finland,
W81-01326 6B

Water Quality and Environmental Impact Model of the Upper Nile Basin,
W81-01330 6G

Sand Bed Instability Due to Bed Load Motion,
W81-01368 2J

Solving Snow-Drifting Problems at Baker Lake, N.W.T., Using Snow-Modelling Techniques,
W81-01405 6B

MONITORING
Analytical Issues in Compliance Monitoring,
W81-01261 7A

Continuous Monitoring for Sewage-Treatment Purposes,
W81-01345 5A

MOSSES
Development of a Wintertime Biomonitor for Heavy Metals in Flowing Waters,
W81-01374 5B

MOVEMENT
Sand Bed Instability Due to Bed Load Motion,
W81-01368 2J

MULTIPLE-PURPOSE RESERVOIRS
Methods for Deriving Optimal Operating Rules for Multiple Reservoir Systems,
W81-01204 6A

MUNICIPAL WASTES
Extended Use of Treated Municipal Waste water by the Buckeye Irrigation Company: A Documentation of Effects,
W81-01208 3C

A Design Study of Biochemical Combined Waste water Treatment Plant,
W81-01311 5D

Use of Mathematical Models to Derive a System for Calculating the Acceptance Capacity of Marine Coastal Waters. (Utilisation de Modeles Mathematiques dans la Mise au Point d'une Methodologie de Calcul de la Capacite d'Acceptation du Milieu Recepteur Littoral Marin.),
W81-01321 5E

The Development of Marine Pollution Control in Hong Kong,
W81-01349 5E

MURDERKILL RIVER ESTUARY
Reexamination of the Water Chemistry and Planktology of a Delaware Tidal Stream as Related to its Flushing Characteristics,
W81-01375 2L

MUSSELS
Cytosome Morphogenesis in Nerve Cells and Lateral Cilio-Inhibition in the Mussel, Mytilus Edulis,
W81-01268 7B

NAPLES (ITALY)
Bacteriological Monitoring of Pollution in Shellfish: Methodological Evaluation,
W81-01371 5A

NATIONAL PARKS
Bacteriological and Nutrient Study of Major Surface Waters in Banff National Park.
W81-01212 5A

Surface Water Quality in Yoho National Park - An Inventory.
W81-01213 5A

NATURAL GAS
Effects of Natural Gas Price Increases on Texas High Plains Irrigation, 1976-2025,
W81-01222 6B

NEGOTIATIONS
Instream Flow Negotiation: Review of Practices,
W81-01230 6E

NETWORKS
Water Distribution Pipe Networks for Arctic Settlements,
W81-01403 8A

NEVADA
Characterization of Storm Runoff in Las Vegas Valley, Nevada,
W81-01205 4C

NEW YORK CITY
Large-Scale Ozone-de Filtration: An Industry First,
W81-01288 5F

NIGERIA
Domestic Water Consumption in Urban Areas: A Case Study in Ibadan City, Nigeria,
W81-01333 6D

Investigations of Pipe-Borne Water Pollution in Benin City, Nigeria,
W81-01372 5B

NILE RIVER
The State of the Nile Environment: An Overview,
W81-01327 5C

Water Quality and Environmental Impact Model of the Upper Nile Basin,
W81-01330 6G

Isolation and Enumeration of Faecal Streptococci from Nile Water (1975-1976),
W81-01340 5A

NITRATES
Modelling Groundwater Contamination from Land-Applied Swine Waste,
W81-01273 7B

NITRIFICATION
Effect of Nitrification on Movement of Trace Metals in Soil Columns,
W81-01365 5E

NORTHERN REGIONS
Introduction to Fire Protection in the North,
W81-01392 6B

NORTHWEST TERRITORIES
Evolution of the Water and Sanitation Policy and Program in the Northwest Territories,
W81-01382 6E

Critical Evaluation of Insulated Shallow Buried Pipe Systems in the Northwest Territories,
W81-01390 8A

Fire Protection in the North,
W81-01393 6B

NORTHWEST TERRITORY (CANADA)
Surface Water Data, Yukon and Northwest Territories, 1979.
W81-01215 7A

NORTHWESTERN TERRITORIES
Water and Energy Conservation Alternatives for the North,
W81-01384 3D

NORWAY
Organochlorine Compounds in Aquatic Environments,
W81-01250 5A

NUTRIENT REMOVAL
Nutrient Removal from Drainage Waters with Systems Containing Aquatic Macrophytes,
W81-01270 5D

NUTRIENTS
Bacteriological and Nutrient Study of Major Surface Waters in Banff National Park.
W81-01212 5A

OCEANS
Comparison of Conventional Inland Sewage Treatment Processes with Marine Treatment by Long Outfalls in the Yugoslav Adriatic Region,
W81-01314 5D

OIL INDUSTRY
Preliminary Investigations into the Effects of Refinery Waste Water, and the Single Effect of its Major Pollutants on Commercially Interesting Crops,
W81-01315 3C

OIL POLLUTION
Distribution of Oil Pollution Residues,
W81-01295 5B

Method for Removing Oil Film from Water Surface,
W81-01421 5G

OIL SPILLS
Dispersion and Weathering of Chemically Treated Crude Oils on the Ocean,
W81-01259 5E

Water Supply Problems in the Construction and Operation of an Oil Pipeline: A Case Study of the Saint Lawrence Lowlands,
W81-01332 5C

OKALOHOMA
The Effect of Storm Interval on the Transport of Soluble Phosphorus in Runoff,
W81-01364 5B

ONTARIO
Studies of Utility Construction in Cold Regions,
W81-01388 8A

Township of Temagami: One Alternative for Servicing a Northern Community,
W81-01389 5D

OPERATING COSTS
Economical Considerations on Local or Centralized Waste water Treatment Systems,
W81-01319 6B

OPERATION AND MAINTENANCE
Sanitation Facilities Operation and Maintenance in Alaskan Native Villages,
W81-01396 6B

Operation, Maintenance and Management Assistance for Rural Sanitation Facilities,
W81-01397 6B

OPTICAL PROPERTIES
Measurements of Underwater Spectral Irradiance in Lake Biwa,
W81-01265 2H

OPTIMIZATION
Methods for Deriving Optimal Operating Rules for Multiple Reservoir Systems,
W81-01204 6A

ORGANIC CHEMICALS
Simplified Monitoring Procedure for Benzo(A)Pyrene, Hexachlorobenzene and Pentachlorophenol in Water,
W81-01251 5A

ORGANIC COMPOUNDS
The Chromatographic and GC/MS Analysis of Organic Priority Pollutants in Water,
W81-01294 5A

ORGANIC MATTER
Isolation and Characterization of Polymeric Organic Materials in a Polluted River Water,
W81-01346 5A

OSLO FJORD AREA (NORWAY)
Organochlorine Compounds in Aquatic Environments,
W81-01250 5A

OUTFALL SEWERS
Comparison of Conventional Inland Sewage Treatment Processes with Marine Treatment by Long Outfalls in the Yugoslav Adriatic Region,
W81-01314 5D

OXYGEN ISOTOPES
A Simple Method Using a Disposable Syringe to Prepare Samples for Delta 018 Measurements in Water Samples,
W81-01241 5A

OXYGEN REQUIREMENTS
An Equitable Approach to Pollution Control with Particular Reference to the Thames Estuary,
W81-01313 5C

OXYGENATION
Scheme for Remedying the Effects of Storm Sewage Overflows to the Tidal River Thames,
W81-01316 5D

OZONE
Large-Scale Ozone-de Filtration: An Industry First,
W81-01288 5F

PAKISTAN
Development of Improved Water Management Practices in Pakistan,
W81-01328 6A

Watercourse Improvement Strategies for Pakistan,
W81-01334 4A

PATENTS
Aquatic Weed Cutter,
W81-01416 4A

Multiple Chamber Drip Irrigation Hose,
W81-01417 3F

Separating Solids From Liquids,
W81-01419 5D

Method for Minimizing the Organic Wastes in Aqueous Product Streams Produced in Liquid-Liquid Extraction Processes,
W81-01420 5D

Method for Removing Oil Film from Water Surface,
W81-01421 5G

Shipboard Blackwater Physical/Chemical Treatment System,
W81-01422 5D

Biological Sewage Treatment Plant,
W81-01423 5D

Water Recycling with Solids and Foam Removal,
W81-01424 5D

Process and Plant for the Recovery of Water from Humid Air,
W81-01425 2K

PATH OF POLLUTANTS
Transport of Trace Elements in Ecosystems of the Barhalde Watershed in the Southern Black Forest,
W81-01278 5B

Waikato River Pollutant Flushing Rates,
W81-01299 5B

Bloom-Forming Cyanobacterium Microcystis Aeruginosa Overwinters on Sediment Surface,
W81-01302 5B

Effect of Nitrification on Movement of Trace Metals in Soil Columns,
W81-01365 5E

PATHOGENIC BACTERIA
Isolation of 01 Servovars of Vibrio Cholerae from Water by Serologically Specific Method,
W81-01282 5A

PENNSYLVANIA
An Evaluation of 'A Procedure For Describing Fish and Wildlife in Pennsylvania'.
W81-01231 6B

PERCOLATION
Simulation of Flow Patterns and Ion-Exchange in Soil Percolation Experiments. Part I. Tracer Experiments and Flow Model,
W81-01415 2G

PESTICIDE KINETICS
Loss of Chlorphyrifos in Pond Water: Examination of Results Using Three Simple Mathematical Models,
W81-01366 5B

PESTICIDE RESIDUES
Identification of Hazardous Organic Chemicals in Fish from the Ashtabula River, Ohio, and Wabash River, Indiana,
W81-01292 5A

Gas Chromatographic Determination of Fluridone Aquatic Herbicide and its Major Metabolite in Fish,
W81-01293 5A

Use of Selected Freshwater Bivalves for Monitoring Organochlorine Pesticide Residues in Major Mississippi Stream Systems, 1972-73,
W81-01303 5B

Pesticides in Ground Water Beneath Irrigated Farmland in Nebraska, August 1978,
W81-01304 5B

PHARMACEUTICAL WASTES
Detrimental Effects of Pharmaceutical Industrial Waste on Microorganisms,
W81-01353 5C

PHOSPHORUS
Determination of Atmospheric Phosphorus Addition to Lake Michigan,
W81-01236 5B

Phosphorus Release from Sediments from Lake Carl Blackwell, Oklahoma,
W81-01339 2H

The Effect of Storm Interval on the Transport of Soluble Phosphorus in Runoff,
W81-01364 5B

PHOTOGRAMMETRY
Large Scale Development of Remote Housing in Subarctic Areas,
W81-01407 7B

PHYTOPLANKTON
The Significance of the Entrapment Zone Location to the Phytoplankton Standing Crop in the San Francisco Bay-Delta Estuary,
W81-01225 2L

Applications of Landsat Data for Estimating Phytoplankton Production in Lake Chad (Africa). (Application des Donnees Landsat a l'Estimation de la Production du Phytoplancton dans le Lac Tchad),
W81-01262 2H

PIPE FLOW
Approximate Analysis of Unsteady Laminar Flow,
W81-01367 8B

PIPELINES
Temporary Pipeline Averts Water Quality Emergency.
W81-01284 5G

Statistical Cost Function Developed for Sewer Lines,
W81-01342 5D

The Application of Skin Effect Current Tracing for Freeze Protection of Water Systems,
W81-01398 8A

Use of a Geothermal Model in Northern Municipal Projects,
W81-01401 8D

Thermodynamic Analysis of the Water Distribution System in Inuvik, NWT,
W81-01402 8A

Water Distribution Pipe Networks for Arctic Settlements,
W81-01403 8A

A Water Supply System for the World's Most Northern Permanent Community,
W81-01404 5F

PIPES
St. Louis County Standardizes Pipe and Procedures for Reliability.
W81-01343 8G

Thawing of Frozen Water Services,
W81-01400 8A

PLANKTON
Attached and Planktonic Algal Communities in Some Inshore Areas of Great Bear Lake,
W81-01253 2H

PLANNING
Methods for Deriving Optimal Operating Rules for Multiple Reservoir Systems,
W81-01204 6A

Five-Year Water Resources Research and Development Plan, Goals and Objectives, 1982-1986.
W81-01207 6E

Regional Five-Year (1982-1987) Water Resources Research: Goals and Objectives.
W81-01209 6E

State of the States: Water Resources Planning and Management.
W81-01233 6E

Input-Output Modeling for Facility Level Water Planning,
W81-01331 6A

Domestic Water Consumption in Urban Areas: A Case Study in Ibadan City, Nigeria,
W81-01333 6D

PLANT TISSUES
Accumulation of Copper in Fluvial Sediments and Yellow Water Lillies (Nuphar Lutea) at Varying Distances from a Metal Processing Plant,
W81-01252 5B

PLASTIC PIPES
Critical Evaluation of Insulated Shallow Buried Pipe Systems in the Northwest Territories,
W81-01390 8A

Pre-Insulated High Density Polyethylene Piping -- The Evolution of a Northern Achievement,
W81-01391 8A

POLLUTANT IDENTIFICATION
Identification of Chlorinated Methoxybiphenyls as Contaminants in Fish and as Potential Interferences in the Determination of Chlorinated Dibenzo-p-Dioxins,
W81-01245 5A

Simplified Monitoring Procedure for Benzo(A)Pyrene, Hexachlorobenzene and Pentachlorophenol in Water,
W81-01251 5A

Field and Laboratory Methods for Investigating a Marine Gasoline Spill,
W81-01260 5A

Identification of Hazardous Organic Chemicals in Fish from the Ashtabula River, Ohio, and Wabash River, Indiana,
W81-01292 5A

Gas Chromatographic Determination of Fluridone Aquatic Herbicide and its Major Metabolite in Fish,
W81-01293 5A

The Chromatographic and GC/MS Analysis of Organic Priority Pollutants in Water,
W81-01294 5A

Determination of Metals in Sewage Effluents,
W81-01356 5A

Bacteriological Monitoring of Pollution in Shellfish: Methodological Evaluation,
W81-01371 5A

POLLUTANTS
Identification of Hazardous Organic Chemicals in Fish from the Ashtabula River, Ohio, and Wabash River, Indiana,
W81-01292 5A

Detrimental Effects of Pharmaceutical Industrial Waste on Microorganisms,
W81-01353 5C

POLLUTION ABATEMENT
Sandia's Activities in Uranium Mill Tailings Remedial Action,
W81-01217 5B

POLYACRYLAMIDES
Case Studies of Acrylamide Pollution Resulting from the Industrial Use of Polyacrylamides,
W81-01355 5B

POLYCHLORINATED BIPHENYLS
An Evaluation of Hazardous Chemicals in Lake Ontario During IFYGL,
W81-01226 5C

Identification of Chlorinated Methoxybiphenyls as Contaminants in Fish and as Potential Interferences in the Determination of Chlorinated Dibenzo-p-Dioxins,
W81-01245 5A

Distribution of Polychlorinated Biphenyls in the Fort Edward, New York, Water System,
W81-01256 5B

POTABLE WATER
Tapping Drinking Water Data: A Prototype System,
W81-01289 10D

Water Supply Problems in the Construction and Operation of an Oil Pipeline: A Case Study of the Saint Lawrence Lowlands,
W81-01332 5C

Does Drinking Water Hardness Affect Cardiovascular Disease,
W81-01362 5C

POWER PLANTS
Effect of the Warm Water Discharge from a Power Station on Fish Populations in the River Trent,
W81-01286 5C

POWER SOURCES
Wind Generated Electric Power for Sanitation Services -- A Case Study,
W81-01385 8C

PREDATION
Relative Effects of Bacterial and Protozoan Predators on Survival of Escherichia Coli in Estuarine Water Samples,
W81-01247 5C

PRESSURE MEASURING INSTRUMENTS
Pressure Transducer for Remote Data Acquisition,
W81-01271 7B

PRESSURE SEWERS
Township of Temagami: One Alternative for Servicing a Northern Community,
W81-01389 5D

PRICES
Effects of Natural Gas Price Increases on Texas High Plains Irrigation, 1976-2025,
W81-01222 6B

PROJECT PLANNING
Economical Considerations on Local or Centralized Waste water Treatment Systems,
W81-01319 6B

Which Plant Expansion is the Most Urgent One in a River System and How to Develop a Priority List,
W81-01320 6A

PROTECTION
Thermodynamic Analysis of the Water Distribution System in Inuvik, NWT,
W81-01402 8A

PROTOZOA
Unusual Behaviour of Ciliated Protozoa in a Secondary Settlement Tank,
W81-01358 5D

PUBLIC BENEFITS
A Post Audit Evaluation of Methodology for Wild and Scenic River Development and Management, The Clearwater River, Idaho: A Case Study of Public Involvement Practices,
W81-01380 6B

PUBLIC HEALTH
Investigations of Pipe-Borne Water Pollution in Benin City, Nigeria,
W81-01372 5B

PUBLIC UTILITIES
Proceedings -- Second Symposium on Utilities Delivery in Northern Regions.
W81-01381 5F

Critical Evaluation of Insulated Shallow Buried Pipe Systems in the Northwest Territories,
W81-01390 8A

Pre-Insulated High Density Polyethylene Piping -- The Evolution of a Northern Achievement,
W81-01391 8A

Sanitation Facilities Operation and Maintenance in Alaskan Native Villages,
W81-01396 6B

New Approaches to Water and Sewer Services in Permafrost Area -- Norman Wells, N.W.T.,
W81-01411 5F

PUMPED STORAGE
Movements of Lake Trout in Twin Lakes, Colorado, in Relation to the Mt. Elbert Pumped-Storage Powerplant,
W81-01239 5C

QUALITY CONTROL
Proficiency Test Sample Media for Single and Mixed Pure Cultures of Water Pollution Indicator Bacteria,
W81-01249 5A

RADIOACTIVE WASTE DISPOSAL
Sandia's Activities in Uranium Mill Tailings Remedial Action,
W81-01217 5B

RADIOACTIVE WASTES
Opportunities for U.S. Fish and Wildlife Service Initiatives Related to Uranium Mining and Milling in the Western United States,
W81-01216 5B

EPA Activities for the Control of Uranium Mining and Milling Effluents,
W81-01218 5B

RADIOISOTOPES
Cytosome Morphogenesis in Nerve Cells and Lateral Cilio-Inhibition in the Mussel, Mytilus Edulis,
W81-01268 7B

RAIN GAGES
A Field Evaluation of the HASL Wet-Dry Deposition Collector,
W81-01351 7B

RAINFALL-RUNOFF RELATIONSHIPS
Dairy Open Lot and Lagoon-Irrigated Pasture Runoff Quantity and Quality,
W81-01272 3C

The Effect of Storm Interval on the Transport of Soluble Phosphorus in Runoff,
W81-01364 5B

RECREATION DEMAND
An Empirical Application of a Model for Estimating the Recreation Value of Instream Flow,
W81-01210 6B

REGIONAL ANALYSIS
Regional Five-Year (1982-1987) Water Resources Research: Goals and Objectives.
W81-01209 6E

REGULATION
Sampling and the Regulatory Maze in the United States,
W81-01258 7A

Trade Effluent Control in London,
W81-01317 5D

RELIABILITY
Sanitation Facilities Operation and Maintenance in Alaskan Native Villages,
W81-01396 6B

REMOTE SENSING
Pressure Transducer for Remote Data Acquisition,
W81-01271 7B

REPAIRING
Analysis of Preventive Sewer Maintenance Programs,
W81-01322 6A

RESEARCH AND DEVELOPMENT
Five-Year Water Resources Research and Development Plan, Goals and Objectives, 1982-1986.
W81-01207 6E

Regional Five-Year (1982-1987) Water Resources Research: Goals and Objectives.
W81-01209 6E

RESEARCH PRIORITIES
Five-Year Water Resources Research and Development Plan, Goals and Objectives, 1982-1986.
W81-01207 6E

Regional Five-Year (1982-1987) Water Resources Research: Goals and Objectives.
W81-01209 6E

RESERVOIR OPERATION
Methods for Deriving Optimal Operating Rules for Multiple Reservoir Systems,
W81-01204 6A

RESERVOIRS
A Three-Dimensional Field Evaluation and Analysis of Water Quality in Two Reservoirs,
W81-01377 2H

RESINS
Poly(Acrylamidoxime) Resin for Determination of Trace Metals in Natural Waters,
W81-01243 5A

REVERSE OSMOSIS
Reverse Osmosis Separation of Thiosalts from Mining Effluents,
W81-01281 5D

REVIEWS
Use of Water Hyacinths in Waste water Treatment,
W81-01361 5D

RIVER BASIN DEVELOPMENT
A Systems Approach to the Study of Interbasin Water Transfers: The Partial Diversion of the USSR's Northern Rivers Flow into the Volga,
W81-01335 6A

RIVER KOKEMAENJOKI (FINLAND)
Accumulation of Copper in Fluvial Sediments and Yellow Water Lillies (Nuphar Lutea) at Varying Distances from a Metal Processing Plant,
W81-01252 5B

RIVERS
Waikato River Pollutant Flushing Rates,
W81-01299 5B

The State of the Nile Environment: An Overview,
W81-01327 5C

Note on Heavy Metal Concentration in the Aquatic Environment of the Kitakyushu District in Japan, 1976-1977,
W81-01338 5B

Isolation and Characterization of Polymeric Organic Materials in a Polluted River Water,
W81-01346 5A

Linear Alkylbenzene Sulfonates in River, Estuary and Bay Water,
W81-01348 5B

Heavy Metal Inputs to Mississippi Delta Sediments--A Historical View,
W81-01373 5B

ROCK BOLTS
Polyester-Resin Anchor Creep Study,
W81-01235 8G

ROCKY MOUNTAINS (CO)
An Empirical Application of a Model for Estimating the Recreation Value of Instream Flow,
W81-01210 6B

RUSSIA
A Systems Approach to the Study of Interbasin Water Transfers: The Partial Diversion of the USSR's Northern Rivers Flow into the Volga,
W81-01335 6A

SAFETY
Hydrologic Investigation, Design, and Construction of Flood Control Structures, Copperhill, Tennessee,
W81-01301 4A

SALINITY
Characterization of Storm Runoff in Las Vegas Valley, Nevada,
W81-01205 4C

SALT TOLERANCE
Isolation and Characterization of Bacteria from the Baltic Sea,
W81-01291 5B

SAMPLING
Water Quality Monitoring--Some Practical Sampling Frequency Considerations,
W81-01257 7A

Sampling and the Regulatory Maze in the United States,
W81-01258 7A

A Field Evaluation of the HASL Wet-Dry Deposition Collector,
W81-01351 7B

SAN FRANCISCO BAY-DELTA ESTUARY
The Significance of the Entrapment Zone Location to the Phytoplankton Standing Crop in the San Francisco Bay-Delta Estuary,
W81-01225 2L

SANITARY ENGINEERING
Full-Scale Evaluation of High Rate Screening Devices for Treatment of Sanitary Sewage By-Pass Flow,
W81-01267 5D

Evolution of the Water and Sanitation Policy and Program in the Northwest Territories,
W81-01382 6E

Programming, Design and Construction of Utilities in Greenland,
W81-01383 5F

Appropriate Technologies for Water Supplies and Sanitation in Northern Communities,
W81-01387 6B

Sanitation Facilities Operation and Maintenance in Alaskan Native Villages,
W81-01396 6B

SANITATION FACILITIES
Operation, Maintenance and Management Assistance for Rural Sanitation Facilities,
W81-01397 6B

SAUDI ARABIA
Quenching the Thirst for Potable Water in Arid Saudi Arabia,
W81-01287 6A

SCENIC EASEMENTS
A Post Audit Evaluation of Methodology for Wild and Scenic River Development and Management, the Clearwater River, Idaho: A Case Study,
W81-01379 6B

A Post Audit Evaluation of Methodology for Wild and Scenic River Development and Management, The Clearwater River, Idaho: A Case Study of Public Involvement Practices,
W81-01380 6B

SCHOOLS (EDUCATION)
Rural Schools Prototype Analysis,
W81-01408 6A

SCLAIRCOR
Pre-Insulated High Density Polyethylene Piping -- The Evolution of a Northern Achievement,
W81-01391 8A

SCREENS
Full-Scale Evaluation of High Rate Screening Devices for Treatment of Sanitary Sewage By-Pass Flow,
W81-01267 5D

SEA SPRAY
A Field Evaluation of the HASL Wet-Dry Deposition Collector,
W81-01351 7B

SEA WATER
Linear Alkylbenzene Sulfonates in River, Estuary and Bay Water,
W81-01348 5B

SEASONAL
Seasonal Fluctuations of Major Diatom Species at Five Stations Across Lake Michigan, May 1970-October 1972,
W81-01223 5C

SEDIMENT DISCHARGE
Sediment Production of Alluvial Channels in Response to Base Level Lowering,
W81-01269 2J

SEDIMENT TRANSPORT
Sand Bed Instability Due to Bed Load Motion,
W81-01368 2J

SEDIMENTOLOGY
Characteristics of Eroded Sediment.
W81-01275 2J

SEDIMENTS
Phosphorus Release from Sediments from Lake Carl Blackwell, Oklahoma,
W81-01339 2H

SEPARATION TECHNIQUES
Proficiency Test Sample Media for Single and Mixed Pure Cultures of Water Pollution Indicator Bacteria,
W81-01249 5A

Isolation of 01 Servovars of Vibrio Cholerae from Water by Serologically Specific Method,
W81-01282 5A

Comparative Investigations of Different Methods to Concentrate Waste Activated Sludge,
W81-01310 5E

Isolation and Characterization of Polymeric Organic Materials in a Polluted River Water,
W81-01346 5A

Separating Solids From Liquids,
W81-01419 5D

Method for Minimizing the Organic Wastes in Aqueous Product Streams Produced in Liquid-Liquid Extraction Processes,
W81-01420 5D

SEPTIC TANKS
Modified Low Pressure Communal Sewage Disposal Systems,
W81-01409 5D

SEWAGE BACTERIA
Indicator-Organism Persistence in Acid-Mine-Water Environments,
W81-01378 5B

SEWAGE DISPOSAL
Use of Mathematical Models to Derive a System for Calculating the Acceptance Capacity of Marine Coastal Waters. (Utilisation de Modeles Mathematiques dans la Mise au Point d'une Methodologie de Calcul de la Capacite d'Acceptation du Milieu Recepteur Littoral Marin.),
W81-01321 5E

Appropriate Technologies for Water Supplies and Sanitation in Northern Communities,
W81-01387 6B

Township of Temagami: One Alternative for Servicing a Northern Community,
W81-01389 5D

Modified Low Pressure Communal Sewage Disposal Systems,
W81-01409 5D

SEWAGE EFFLUENTS
A Note on the Sensitivity of Chlorine-Stressed Bifidobacteria to Nalidixic Acid,
W81-01290 5A

Determination of Metals in Sewage Effluents,
W81-01356 5A

Modified Low Pressure Communal Sewage Disposal Systems,
W81-01409 5D

SEWAGE SLUDGE
Low Cost of Provision of Anaerobic Digestion,
W81-01312 5E

SEWAGE TREATMENT
Full-Scale Evaluation of High Rate Screening Devices for Treatment of Sanitary Sewage By-Pass Flow,
W81-01267 5D

Upgrading Lagoon Effluents with Rock Filters,
W81-01298 5D

Comparison of Conventional Inland Sewage Treatment Processes with Marine Treatment by Long Outfalls in the Yugoslav Adriatic Region,
W81-01314 5D

Innovation Simplifies Construction and Treatment,
W81-01325 5D

Waste water Fractions Add to Total Treatment Picture,
W81-01341 5D

Continuous Monitoring for Sewage-Treatment Purposes,
W81-01345 5A

The Use of Ultra High Rate Dual-Medium Filtration and Dissolved-Air Flotation for Maintenance of Consistent Effluent Standards at High Loadings,
W81-01360 5D

Township of Temagami: One Alternative for Servicing a Northern Community,
W81-01389 5D

New Approaches to Water and Sewer Services in Permafrost Area -- Norman Wells, N.W.T.,
W81-01411 5F

Biological Sewage Treatment Plant,
W81-01423 5D

SEWERS
Analysis of Preventive Sewer Maintenance Programs,
W81-01322 6A

Sanitation Facilities Operation and Maintenance in Alaskan Native Villages,
W81-01396 6B

SHELLFISH
Bacteriological Monitoring of Pollution in Shellfish: Methodological Evaluation,
W81-01371 5A

SITES
Western States Inventory of Low-Head Hydroelectric Sites, Volume 2, Appendix D, Environmental Screening.
W81-01232 6G

SKIN EFFECT CURRENT TRACING
The Application of Skin Effect Current Tracing for Freeze Protection of Water Systems,
W81-01398 8A

SLUDGE DISPOSAL
Fluidized-Bed Incineration of Sewage Sludge at Esher, 1976-1978,
W81-01344 5E

SLUDGE TREATMENT
Anaerobic Sludge Digestion Process with Prolonged Digestion Time for the Solid Substances and Shortened for the Sludge Liquor,
W81-01306 5E

Design Data for Gravity Thickeners,
W81-01308 5E

Evolution of Primary Sludge During Thickening,
W81-01309 5E

Comparative Investigations of Different Methods to Concentrate Waste Activated Sludge,
W81-01310 5E

Fluidized-Bed Incineration of Sewage Sludge at Esher, 1976-1978,
W81-01344 5E

SMOLT
Evaluations of a Bypass System for Juvenile Salmonids at Little Goose Dam,
W81-01300 8I

SNOW DRIFTING
Solving Snow-Drifting Problems at Baker Lake, N.W.T., Using Snow-Modelling Techniques,
W81-01405 6B

SNOW MANAGEMENT
Solving Snow-Drifting Problems at Baker Lake, N.W.T., Using Snow-Modelling Techniques,
W81-01405 6B

SNOWPACKS
A Comparative Study of Microwave Radiometer Observations over Snowfields with Radioactive Transfer Model Calculations,
W81-01283 2C

Solving Snow-Drifting Problems at Baker Lake, N.W.T., Using Snow-Modelling Techniques,
W81-01405 6B

SOCIAL ASPECTS
Western States Inventory of Low-Head Hydroelectric Sites, Volume 2, Appendix D, Environmental Screening.
W81-01232 6G

SOCKEYE SALMON
Cedar River Sockeye Salmon Production, 1980,
W81-01206 8I

SOIL AGGREGATES
Characteristics of Eroded Sediment.
W81-01275 2J

SOIL CHEMICAL PROPERTIES
Movement of Chloride in a Soil with Variable Charge Properties: I. Chloride Systems,
W81-01323 5E

SOIL HEATING
Waste Heat Utilization through Soil Heating,
W81-01386 3C

SOIL TESTS
Effect of Nitrification on Movement of Trace Metals in Soil Columns,
W81-01365 5E

SOIL WATER MOVEMENT
Simulation of Flow Patterns and Ion-Exchange in Soil Percolation Experiments. Part I. Tracer Experiments and Flow Model,
W81-01415 2G

SOLVENT EXTRACTION
The Treatment of Woolscour Effluent-II. Grease Removal by Alcohol Extraction,
W81-01414 5D

SOUTHWEST U.S.
Regional Five-Year (1982-1987) Water Resources Research: Goals and Objectives.
W81-01209 6E

SPORT FISH
Effects of Alterations to Low Gradient Reaches of Utah Streams,
W81-01224 6G

SPRINKLERS
Fire Protection Considerations in Remote, Cold Regions Communities,
W81-01394 6B

ST. LAWRENCE RIVER
Water Supply Problems in the Construction and Operation of an Oil Pipeline: A Case Study of the Saint Lawrence Lowlands,
W81-01332 5C

ST. THOMAS (ONTARIO)
Stormwater Management Technology Systems Demonstration in the City of St. Thomas.
W81-01211 5G

STANDING CROPS
The Significance of the Entrapment Zone Location to the Phytoplankton Standing Crop in the San Francisco Bay-Delta Estuary,
W81-01225 2L

STORM DRAINS
Temporary Detention Cuts Storm Flow Peaks,
W81-01254 4A

STORM RUNOFF
Characterization of Storm Runoff in Las Vegas Valley, Nevada,
W81-01205 4C

Stormwater Management Technology Systems Demonstration in the City of St. Thomas.
W81-01211 5G

Temporary Detention Cuts Storm Flow Peaks,
W81-01254 4A

Scheme for Remedying the Effects of Storm Sewage Overflows to the Tidal River Thames,
W81-01316 5D

The Effect of Storm Interval on the Transport of Soluble Phosphorus in Runoff,
W81-01364 5B

STREAM IMPROVEMENT
Effects of Alterations to Low Gradient Reaches of Utah Streams,
W81-01224 6G

Summaries of Riparian and Stream Alteration Studies Completed by the Eastern Energy and Land Use Team.
W81-01228 10C

Effects of Alterations to Low Gradient Reaches of Utah Streams: Summary,
W81-01234 6G

STREAMFLOW
Surface Water Data, Atlantic Provinces, 1979.
W81-01214 7A

Surface Water Data, Yukon and Northwest Territories, 1979.
W81-01215 7A

Protecting Instream Flows in Montana: Yellowstone River Reservation Case Study,
W81-01219 6E

Instream Flow Negotiation: Review of Practices,
W81-01230 6E

Stochastic Generation of Annual Streamflows,
W81-01369 6A

STREPTOCOCCUS
Isolation and Enumeration of Faecal Streptococci from Nile Water (1975-1976),
W81-01340 5A

SUGAR BEET INDUSTRY
Liquid Waste Reduction Technology for Industries Demonstrated by the Treatment of Sugar Beet Waste Water,
W81-01307 5D

SULFUR COMPOUNDS
Reverse Osmosis Separation of Thiosalts from Mining Effluents,
W81-01281 5D

SURFACE WATER AVAILABILITY
Surface Water Data, Atlantic Provinces, 1979.
W81-01214 7A

Surface Water Data, Yukon and Northwest Territories, 1979.
W81-01215 7A

SURFACE WATERS
Bacteriological and Nutrient Study of Major Surface Waters in Banff National Park.
W81-01212 5A

Surface Water Quality in Yoho National Park - An Inventory.
W81-01213 5A

SURVEYS
A Post Audit Evaluation of Methodology for Wild and Scenic River Development and Management, the Clearwater River, Idaho: A Case Study,
W81-01379 6B

A Post Audit Evaluation of Methodology for Wild and Scenic River Development and Management, The Clearwater River, Idaho: A Case Study of Public Involvement Practices,
W81-01380 6B

SYSTEMS ANALYSIS
Input-Output Modeling for Facility Level Water Planning,
W81-01331 6A

A Systems Approach to the Study of Interbasin Water Transfers: The Partial Diversion of the USSR's Northern Rivers Flow into the Volga,
W81-01335 6A

TAMAGAWA RIVER (JAPAN)
Isolation and Characterization of Polymeric Organic Materials in a Polluted River Water,
W81-01346 5A

TANNERY WASTES
Anaerobic Contact Filter Process: A Suitable Method for the Treatment of Vegetable Tanning Effluents,
W81-01359 5D

TEMPERATURE
Effect of the Warm Water Discharge from a Power Station on Fish Populations in the River Trent,
W81-01286 5C

TENSIOMETERS
Measurement of Depth to Water Table in a Heavy Clay Soil,
W81-01279 2F

TERRAIN UNIT MAPPING
Large Scale Development of Remote Housing in Subarctic Areas,
W81-01407 7B

TETON DAM (ID)
Teton Dam-Foundation Grout Testing Program,
W81-01237 8F

TEXAS
Effects of Natural Gas Price Increases on Texas High Plains Irrigation, 1976-2025,
W81-01222 6B

THAWING
Thawing of Frozen Water Services,
W81-01400 8A

TIDAL EFFECTS
Reexamination of the Water Chemistry and Planktology of a Delaware Tidal Stream as Related to its Flushing Characteristics,
W81-01375 2L

TIDES
Modification of the Tide in the Canadian Arctic by an Ice Cover,
W81-01412 2C

TOKYO BAY
Linear Alkylbenzene Sulfonates in River, Estuary and Bay Water,
W81-01348 5B

TOXINS
Industrial Waste Control Procedures in the City of Los Angeles, California, U.S.A.,
W81-01318 5D

TRACE ELEMENTS
Poly(Acrylamidoxime) Resin for Determination of Trace Metals in Natural Waters,
W81-01243 5A

Transport of Trace Elements in Ecosystems of the Barhalde Watershed in the Southern Black Forest,
W81-01278 5B

TRANSDUCERS
Pressure Transducer for Remote Data Acquisition,
W81-01271 7B

TREATMENT FACILITIES
Innovation Simplifies Construction and Treatment,
W81-01325 5D

TRICKLING FILTERS
A Design Study of Biochemical Combined Waste water Treatment Plant,
W81-01311 5D

TURBULENT FLOW
Erosion by Circular Wall Jets in Cross Flow,
W81-01350 4D

TWIN LAKES (CO)
Movements of Lake Trout in Twin Lakes, Colorado, in Relation to the Mt. Elbert Pumped-Storage Powerplant,
W81-01239 5C

UNSTEADY FLOW
Approximate Analysis of Unsteady Laminar Flow,
W81-01367 8B

UNSTEADY STATE TEST
The Role of the Cobalt Catalyst in the Unsteady-State Test,
W81-01357 5D

URANIUM MILL TAILINGS
Sandia's Activities in Uranium Mill Tailings Remedial Action,
W81-01217 5B

URANIUM MINING
Opportunities for U.S. Fish and Wildlife Service Initiatives Related to Uranium Mining and Milling in the Western United States,
W81-01216 5B

EPA Activities for the Control of Uranium Mining and Milling Effluents,
W81-01218 5B

URBAN HYDROLOGY
Temporary Detention Cuts Storm Flow Peaks,
W81-01254 4A

URBAN RUNOFF
Stormwater Management Technology Systems Demonstration in the City of St. Thomas.
W81-01211 5G

URBANIZATION
Characterization of Storm Runoff in Las Vegas Valley, Nevada,
W81-01205 4C

Review and Evaluation of Urban Flood Flow Frequency Procedures,
W81-01221 4C

Water and Sewer Utilities for Barrow, Alaska,
W81-01410 6A

USE RATES
An Empirical Application of a Model for Estimating the Recreation Value of Instream Flow,
W81-01210 6B

UTAH
Effects of Alterations to Low Gradient Reaches of Utah Streams,
W81-01224 6G

Effects of Alterations to Low Gradient Reaches of Utah Streams: Summary,
W81-01234 6G

UTILIDORS
Thermodynamic Analysis of the Water Distribution System in Inuvik, NWT,
W81-01402 8A

Water and Sewer Utilities for Barrow, Alaska,
W81-01410 6A

UTILITIES
Programming, Design and Construction of Utilities in Greenland,

W81-01207 6E

State of the States: Water Resources Planning and Management.
W81-01233 6E

WATER RESOURCES DEVELOPMENT
Development of Improved Water Management Practices in Pakistan,
W81-01328 6A

Input-Output Modeling for Facility Level Water Planning,
W81-01331 6A

A Post Audit Evaluation of Methodology for Wild and Scenic River Development and Management, the Clearwater River, Idaho: A Case Study,
W81-01379 6B

A Post Audit Evaluation of Methodology for Wild and Scenic River Development and Management, The Clearwater River, Idaho: A Case Study of Public Involvement Practices,
W81-01380 6B

WATER RESOURCES PLANNING
Regional Five-Year (1982-1987) Water Resources Research: Goals and Objectives.
W81-01209 6E

Analysis of Preventive Sewer Maintenance Programs,
W81-01322 6A

WATER REUSE
Extended Use of Treated Municipal Waste water by the Buckeye Irrigation Company: A Documentation of Effects,
W81-01208 3C

Treatment and Disposal of Sugarbeet Processing Waste Water by Irrigation,
W81-01220 3C

Water Recycling with Solids and Foam Removal,
W81-01424 5D

WATER RIGHTS
Instream Flow Negotiation: Review of Practices,
W81-01230 6E

WATER SAMPLING
Water Quality Monitoring--Some Practical Sampling Frequency Considerations,
W81-01257 7A

WATER SOURCES
A Comparative Study of Microwave Radiometer Observations over Snowfields with Radioactive Transfer Model Calculations,
W81-01283 2C

WATER SPORTS
An Empirical Application of a Model for Estimating the Recreation Value of Instream Flow,
W81-01210 6B

WATER SUPPLY
Quenching the Thirst for Potable Water in Arid Saudi Arabia,
W81-01287 6A

WATER SUPPLY DEVELOPMENT
Indigenous Resources and Water Supply Management,
W81-01329 4B

WATER TABLE
Measurement of Depth to Water Table in a Heavy Clay Soil,
W81-01279 2F

WATER TREATMENT
Capture of Latex Beads, Bacteria, Endotoxin, and Viruses by Charge-Modified Filters,
W81-01240 5D

Large-Scale Ozone-de Filtration: An Industry First,
W81-01288 5F

Chloroform Production from the Chlorination of Aquatic Humic Material: The Effect of Molecular Weight, Environment and Season,
W81-01337 5F

WATER UTILIZATION
Western Energy and Land Use Team Publications: A Bibliography with Abstracts.
W81-01227 10C

Mono Lake, California: Saving a Lake or Serving a City,
W81-01255 3D

WATER VAPOR
Process and Plant for the Recovery of Water from Humid Air,
W81-01425 2K

WATER WORKS
Studies of Utility Construction in Cold Regions,
W81-01388 8A

Sanitation Facilities Operation and Maintenance in Alaskan Native Villages,
W81-01396 6B

Thawing of Frozen Water Services,
W81-01400 8A

Waterworks Systems, Yellowknife, Northwest Territories,
W81-01406 5F

WELL SPACING
Mountain Residential Development-Minimum Well Protective Distances-Well Water Quality,
W81-01363 5B

WETLANDS
Water Bank Program, 1972 Through September 30, 1979.
W81-01229 5G

WHEAT
Effect of Varying Mg/Ca Ratio and Electrolyte Concentration in the Irrigation Water on the Soil Properties and Growth of Wheat,
W81-01305 5C

WILD RIVER ACT
A Post Audit Evaluation of Methodology for Wild and Scenic River Development and Management, the Clearwater River, Idaho: A Case Study,
W81-01379 6B

A Post Audit Evaluation of Methodology for Wild and Scenic River Development and Management, The Clearwater River, Idaho: A Case Study of Public Involvement Practices,
W81-01380 6B

WILDLIFE
Opportunities for U.S. Fish and Wildlife Service Initiatives Related to Uranium Mining and Milling in the Western United States,
W81-01216 5B

Western Energy and Land Use Team Publications: A Bibliography with Abstracts.
W81-01227 10C

Summaries of Riparian and Stream Alteration Studies Completed by the Eastern Energy and Land Use Team.
W81-01228 10C

WILDLIFE HABITATS
Water Bank Program, 1972 Through September 30, 1979.
W81-01229 5G

An Evaluation of 'A Procedure For Describing Fish and Wildlife in Pennsylvania'.
W81-01231 6B

WIND POWER
Wind Generated Electric Power for Sanitation Services -- A Case Study,
W81-01385 8C

WOOL GREASE
The Treatment of Woolscour Effluent - I. Removal of Colloidal Dirt,
W81-01413 5D

The Treatment of Woolscour Effluent-II. Grease Removal by Alcohol Extraction,
W81-01414 5D

YELLOWKNIFE (NWT)
Waterworks Systems, Yellowknife, Northwest Territories,
W81-01406 5F

YELLOWSTONE RIVER BASIN (MT)
Protecting Instream Flows in Montana: Yellowstone River Reservation Case Study,
W81-01219 6E

YOHO NATIONAL PARK (BRITISH COLUMBIA)
Surface Water Quality in Yoho National Park - An Inventory.
W81-01213 5A

YUKON
Surface Water Data, Yukon and Northwest Territories, 1979.
W81-01215 7A

ZOOPLANKTON
Reexamination of the Water Chemistry and Planktology of a Delaware Tidal Stream as Related to its Flushing Characteristics,
W81-01375 2L

AUTHOR INDEX

ABAEVA, T. V.
Method for Removing Oil Film from Water Surface,
W81-01421 5G

ABDULHADI, A.
Preliminary Investigations into the Effects of Refinery Waste Water, and the Single Effect of its Major Pollutants on Commercially Interesting Crops,
W81-01315 3C

ABOSAMRA, F.
Evolution of Primary Sludge During Thickening,
W81-01309 5E

ADAM, K. M.
Solving Snow-Drifting Problems at Baker Lake, N.W.T., Using Snow-Modelling Techniques,

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 14, NUMBER 9
MAY 1, 1981

W81-01426 -- W81-01650

CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce.

SWRA is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240. The **SWRA Journal** is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: Journal only, $100; Journal and Annual Indexes, $125; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS. Price codes are given in the entries and a current code-price conversion table is printed on the outside back cover. Other documents are available from originating organizations or authors as indicated in the citation.

SELECTED WATER RESOURCES ABSTRACTS

A semimonthly publication of the Office of Water Research and Technology,
U.S. Department of the Interior

VOLUME 14, NUMBER 9
MAY 1, 1981

W81-01426 -- W81-01650

The Secretary of the Interior has determined that the publication of the periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1983.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

PREFACE

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. These documents cover water resources as treated in the life, physical, and social sciences and the related engineering and legal aspects of the characteristics, supply condition, conservation, control, use, or management of water resources. Each abstract includes a full bibliographic citation and a set of descriptors which are listed in the **Water Resources Thesaurus.** The abstract entries are classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the then Federal Council for Science and Technology.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several services of the Office of Water Research and Technology. The cumlative SWRA file from 1968 and monthly updates are available also in magnetic tape through lease from NTIS.

THE OFFICE OF WATER RESEARCH AND TECHNOLOGY DOES NOT PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Comments and suggestions concerning the contents and arrangement of this bulletin are welcome.

Office of Water Research and Technology

Washington, D.C. 20240

CONTENTS

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER

Includes the following Groups: Properties; Aqueous Solutions and Suspensions.

02 WATER CYCLE

Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION

Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL

Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION

Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING

Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA

Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS

Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES

Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

2C. Snow, Ice, and Frost

COMMENT ON 'EFFECTS OF CHANNEL ENLARGEMENT BY RIVER ICE PROCESSES ON BANKFULL DISCHARGE IN ALBERTA, CANADA' BY D. G. SMITH,
Kellerhals Engineering Services, Heriot Bay (British Columbia).
R. Kellerhals, and M. Church.
Water Resources Research, Vol 16, No 6, p 1131-1134, December, 1980. 2 Fig, 19 Ref.

Descriptors: *Ice breakup, *River flow, *Scour, Stream erosion, Flood recurrence interval, Alberta, *Canada, Ice jams, Streamflow, Channels, Banks, Erosion, Flood flow, Flood plains.

The author challenges Smith's (1979) explanation (channel scour due to ice jams and ice transport at breakup enlarges river channels) for the unusually long time observed for Albertan rivers to return to bankfull flow. Although the ice scour is not dismissed entirely, three other explanations are suggested: recent entrenchment of some major rivers' return periods may be shorter than Smith's indication, and small streams ice completely to the bottom, causing flooding upon breakup. (Cassar-FRC)

2D. Evaporation and Transpiration

NIGHTTIME, WET CANOPY EVAPORATION RATES AND THE WATER BALANCE OF AN EVERGREEN MIXED FOREST,
Forest Research Inst., Christchurch (New Zealand).
A. J. Pearce, L. K. Rowe, and J. B. Stewart.
Water Resources Research, Vol 16, No 5, p 955-959, October, 1980. 1 Fig, 15 Ref.

Descriptors: *Evaporation, *Interception, Diurnal, Hydrologic cycle, Energy transfer, Water balance, Canopy, Mathematical studies, Regression analysis, Rainfall, Transpiration, Radiation, Stemflow.

The nighttime evaporation rates from the wet canopy of an evergreen mixed forest were investigated to better understand the water balance and diurnal energy relationships. The study site, located in the northwest sector of South Island, New Zealand, averaged 2600 mm of rainfall per year, and 50% of this occurred at night. A regression of interception loss on gross rainfall for 35 storms occurring between 7 pm and 7 am LT showed that the average nighttime evaporation rate of water intercepted on the forest canopy was 0.37 mm/hour. The same rate was also calculated for both daytime and nighttime rainfall in 1975-1976. This similarity between daytime and nighttime evaporation rates suggested that evaporation from the wet canopy is driven by advected energy instead of radiation. A net interception loss of 81-84% of gross interception was calculated from the diurnal rainfall distribution and nighttime evaporation rate. This value was greater than the net losses measured in other investigations where losses at night were not considered separately but were estimated in conjunction with losses occurring during the day. Nighttime interception losses were about 30% of total evaporation, 40-50% of total gross interception, and 50-60% of the total net interception. (Geiger-FRC)

COMMENT ON 'DRAINAGE NETWORK POWER' BY K. J. GREGORY, AND REPLY BY K. J. GREGORY,
Sheffield Univ. (England). Dept. of Geography.
A. D. Knighton.
Water Resources Research, Vol 16, No 6, p 1128-1129, December, 1980. 1 Tab, 6 Ref.

Descriptors: *Drainage, *Streamflow, Flow measurement, Hydrology, Channels, Potential flow, *Flow characteristics, Basins, Topography, Forecasting, Evaluation.

Gregory stated in a 1979 paper that flow characteristics in a drainage network can be estimated by using the index of estimated channel volume to total relief of the basin, and that this index expresses the potential energy available in the stream network of a drainage basin. This assertion is challenged because the structure of the network is ignored and only bankfull stage is considered. In addition, it is claimed that the parameters are not easily measured and that results would be a poor estimate of flow characteristics. Gregory replies to these criticisms with further clarifications and claims that although the proposed index is not perfect, it is an improvement on existing knowledge of the relation between channel length and channel capacity. (Cassar-FRC)
W81-01517

DISTRIBUTION-FREE METHODS FOR ESTIMATING FLOOD AND STREAMFLOW EXCEEDANCE PROBABILITIES BY CORRELATION,
Institute of Hydrology, Wallingford (England).
D. M. Cooper, and R. T. Clarke.
Water Resources Research, Vol 16, No 6, p 1121-1127, December, 1980. 3 Fig, 2 Tab, 8 Ref.

Descriptors: *Flood forecasting, *Streamflow forecasting, *Peak discharge, *Correlation analysis, Annual flood, River forecasting, Probability, Mathematical studies, Hydrologic data, Rainfall, Flood profiles, Flood plains, Flood frequency, Estimating, Planning, Thames River(UK).

A distribution-free method is proposed for inferring probabilistic properties of a variable y (such as an annual flood in a given year or total runoff from a basin in a year) from longer records of another variable x which is related to y. Examples of x variables are annual flood measured in a neighboring basin and total mean areal precipitation in the same period. Although this method is not applicable to estimating floods of very large return periods, such as for spillway design, it should be useful in estimating floods on a shorter return period, for example, culvert design or planning land use in flood plains. As an illustration, 40 years of January streamflow and 80 years of precipitation records for the River Thames at Eddington produced close to the same estimates as those obtained from 80 years' records of both streamflow and precipitation. SEASONAL RUNOFF VOLUMES CONDITIONED ON FORECASTED TOTAL RUNOFF VOLUME,
Hokkaido Univ., Sapporo (Japan). Dept. of Civil Engineering.
K. Hoshi, and S. J. Burges.
Water Resources Research, Vol 16, No 6, p 1079-1084, December, 1980. 2 Fig, 4 Tab, 19 Ref.

Descriptors: *Snowmelt, *Runoff forecasting, Model studies, Forecasting, Streamflow forecasting, Snowpacks, Mathematical models, *Cascade Mountains(WA), Cedar River(WA), Washington, Estimating, Melt water, Melting, Glaciohydrology.

Total snowmelt runoff from a snowpack may be forecast accurately for a 6 month period. This paper describes a relatively simple and complete mathematical model which was used to divide the total forecast into monthly stream flow estimates (March - August) of the Cedar River, Washington, located in the Cascade Range. The unconditional distribution of total runoff volume for the melt season and the unconditional flow in each period within the melt season are approximated using three-parameter log normal distributions (LN3). Conditional means, skew coefficients, and covariance between periods are calculated. Uniform transformation methodology is necessary to estiamte quantiles in a multivariate Gaussian domain. These quantiles are then inversely transformed to yield flow quantities. (Cassar-FRC)
W81-01557

HYDROLOGIC REGRESSION WITH WEIGHTED LEAST SQUARES,
Geological Survey, Reston, VA.
G. D. Tasker.
Water Resources Research, Vol 16, No 6, p 1107-1113, December, 1980. 3 Tab, 10 Ref.

Descriptors: *Hydrology, *Streamflow, *Regression analysis, Peak discharge, Time series analysis, Mathematical studies, Model studies, Basins, Drainage area, Equations, Least squares method, *Flow characteristics.

Weighted least squares regression was found more accurate than ordinary least squares regression in a model simulation to calculate streamflow characteristics from basin characteristics for times and places where gaging data is lacking. The weighting function assumes the dependent variable to be a T-year peak discharge estimated by fitting the common logarithm of the observed annual peak discharge to a Pearson type 3 distribution. Although the model simulated a 50-year peak discharge, weighted least squares regression would be expected to have a greater advantage over ordinary least squares for a 100-year peak discharge. (Cassar-FRC)

ECOLOGICAL STUDIES ON THE SUDANESE NILE SYSTEM,
Gezira Univ., Wad Medani (Sudan).
M. E. M. Beshir, and A. I. El-Moghraby.
Water Supply and Management, Vol 4, No 1/2, p 25-28, 1980. 1 Tab, 10 Ref.

Descriptors: *River flow, *Sedimentation rates, *Ecological distribution, Dominant organisms, River basins, Silts, Limnology, Hydrologic aspects, Vegetation, *Nile River.

Ecological studies on the Sudanese Nile River system are reviewed, beginning with the works of mid-eighteenth century explorers and including the modern works of H. E. Hurst and others. Over half of the Nile's length lies in the Sudan, and counting tributaries, 6000 km of river are available for study. The first phase of studies documented the various hydrobiological aspects of the river, including limnology, water chemistry, fish, and vegetation. The second phase is purely ecological

and was prompted by the need to accumulate accurate data during a time of rapid development. Current research projects include studies of the swamps, flood plains, and toich areas. Investigations of the limit and distribution of aquatic plants and studies of the White Nile north of Malakal are also ongoing. The White Nile studies hope to determine the seasonal sediment transport and deposition, evaporation losses, spread of aquatic weeds, and the distribution of fish, phytoplankton, and zooplankton. (Small-FRC)
W81-01563

2F. Groundwater

MODELING GROUNDWATER FLOW OVER SLOPING BEDS,
New South Wales Univ., Kensington (Australia). Dept. of Civil Engineering.
T. G. Chapman.
Water Resources Research, Vol 16, No 6, p 1114-1118, December, 1980. 7 Fig, 1 Tab, 23 Ref.

Descriptors: *Groundwater movement, *Dupuit-Forchheimer theory, *Slopes, Hydraulic gradient, Flow, Subsurface flow, Uniform flow, *Model studies, Mathematical models.

The Dupuit-Forchheimer approach to problems in unconfined groundwater flow over a sloping bed assumes that stream lines are horizontal for small inclinations of the free surface and that the hydraulic gradient is equal to the slope of the free surface, not varying with depth. A simpler expression for numerical modeling, using horizontal and vertical axes, is developed for slope angles up to 30 degrees. Testing on two situations, uniform recharge to ditches on a sloping bed and steady flow through a dam with vertical faces, shows good results using the extended Dupuit-Forchheimer equation. Comparisons of the standard versus the extended equation show that the standard approach is satisfactory for slopes up to 10 degrees where the flow is essentially horizontal. The extended assumptions are more accurate at larger angles and when the free surface and bed level contours have similar patterns. (Cassar-FRC)
W81-01518

A SEMIANALYTICAL SOLUTION FOR PARTIAL PENETRATION IN TWO-LAYER AQUIFERS,
Pahlavi Univ., Shiraz (Iran).
I. Javandel, and P. A. Witherspoon.
Water Resources Research, Vol 16, No 6, p 1099-1106, December, 1980. 12 Fig, 1 Tab, 26 Ref.

Descriptors: *Aquifer testing, *Drawdown, *Flow measurement, Laplaces equation, Water wells, Wells, Aquifers, Groundwater movement, Pumping tests, Permeability, Porous media, Recharge, Subsurface waters, Natural recharge, Model studies, Mathematical models.

A semianalytical solution is presented for the problem of drawdown distribution in a 2-layer aquifer (the lower layer is very thick relative to the top layer) drained by a well which penetrates only the top layer. Numerical inversion of the Laplace transformation was applied to several practical cases: (1) the depth of penetration of the well equals the total thickness of the top layer and the permeability of the lower layer vanishes, (2) the permeability of the lower layer is zero, (3) the flow properties of both layers are identical, (4) the pumping well penetrates all the way through the top aquifer. In short intervals of time, drawdown in the pumped layer resembles the case of partial penetration in a single layer with the same properties. The effects of partial penetration disappear as distance exceeds 1.5 times the thickness of the pumped layer (single-layer aquifer). (Cassar-FRC)
W81-01555

2G. Water In Soils

FINITE ELEMENT ANALYSIS OF SOLUTE TRANSPORT UNDER HYSTERETIC UNSATURATED FLOW CONDITIONS,
National Hydrology Research Inst., Ottawa (Ontario).
J. F. Pickens, and R. W. Gillham.
Water Resources Research, Vol 16, No 6, p 1071-1078, December, 1980. 8 Fig, 1 Tab, 36 Ref.

Descriptors: *Hysteresis, *Solutes, Model studies, *Soil water movement, Hydrologic properties, Flow, Unsaturated flow, Saturated flow, Pressure head, Soil moisture, Time lag, Hydraulic properties, *Finite element analysis.

A model for the two-dimensional simulation of the transient movement of water and solutes in saturated-unsaturated soils was formulated by incorporating the Gillham representation of a hysteretic water content-pressure head relation into the nonhysteretic finite element model of unsaturated-unsaturated solute transport described by Pickens. The flow portion of the model agreed with results reported by Gillham, and the solute transport portion compared well with Pickens' analytical solution results. The model was applied to a hypothetical case involving the one-dimensional transport of a slug of water containing a nonreactive tracer during an infiltration-redistribution sequence in a vertical column of sand. Simulations were conducted using hysteretic and nonhysteretic properties given by either the main drying or the main wetting curve. The effect of including or neglecting hysteresis was greatest in the pressure head and water content profiles and of minor importance in the concentration profiles. The differences in hysteretic and nonhysteretic concentration profiles were not large and, for practical problems, are probably within the limits of uncertainty associated with the measurement of soil parameters. (Cassar-FRC)
W81-01556

2H. Lakes

INVESTIGATIONS OF WALKER LAKE, NEVADA: DYNAMIC ECOLOGICAL RELATIONSHIPS,
Nevada Univ. Systems, Reno. Desert Research Inst.
D. L. Koch, J. J. Cooper, E. L. Lider, R. L. Jacobson, and R. J. Spencer.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-160970, Price codes: A10 in paper copy, A01 in microfiche. Publication No 50010, 1979. 191 p, 45 Fig, 37 Tab, 128 Ref. OWRT-C-6158(No 5236)(2) and C-7180 (No 6216)(2), 14-34-0001-5236, 6216.

Descriptors: *Ecosystems, *Water quality, *Aquatic environment, Food chains, Salmonids, Saline water, Aquatic microorganisms, Benthos, *Lakes, Algae, Cyanophyto, Hypolimnion, Environmental effects, Fish, Zooplankton, Nevada, Walker Lake(NV).

Water quality conditions of Walker Lake were found to be fairly homogeneous. Upstream diversions have resulted in a deficit water balance of the lake of 1 - 1.25 m per year since the turn of the century and a current level of 10,700 mg/l of T.D.S. The blue-green algae, Nodularia spumigena, was dominant over other algal species. A large buildup of sinking organic matter results in large oxygen demands in the hypolimnion and has become limiting to other biological populations. The benthos communities have become limited to a narrow littoral zone which limit the availability of food supplies for the Lahontan cutthroat trout juveniles. The zooplankton community is limited to three species with Diaptomus sicilis dominating. The trout population, which has been maintained through hatchery stocking programs, experience several limiting conditions; while the dominant fish species, tui chub, were found to be reproducing successfully and are quite adaptable. They form the major source of food for the adult Lahontan cutthroat trout in the lake. Exotic fish species bioassays indicated that none were able to survive 100% Walker Lake water.

A MODEL OF THE MEAN FIELD DISTRIBUTION OF A DISSOLVED SUBSTANCE WITHIN THE RIVERINE LAYER OF A FJORD LAKE,
National Water Research Inst., Burlington (Ontario).
P. F. Hamblin, and E. C. Carmack.
Water Resources Research, Vol 16, No 6, p 1094-1098, December, 1980. 6 Fig, 11 Ref.

Descriptors: *Fjords, *Lakes, *Mixing, Diffusion, Kootenay Lake(BC), Duncan River(BC), Kootenay River(BC), *British Columbia, Inflow, Path of pollutants, Rivers, Canada, Water pollution, Dispersion, Diffusivity.

The time-averaged distribution of a dissolved substance in a fjord system was determined for Kootenay Lake in British Columbia. This lake, 100 km x 4 km x 150 meters deep, is fed by two rivers entering at 180 degrees. Using advection-diffusion equations, a horizontal dispersion coefficient of 300 square meters per second was deduced by matching the predictions to the horizontal distribution of vertically averaged conductivity over the riverine layer. A vertical turbulent diffusivity of 0.000005 square meters per second was inferred for the riverine layer. Limits of the model were as follows: negligible tidal and wind influence, same temperature and salinity of incoming rivers, extension of riverine layer across the width of the fjord. (Cassar-FRC)
W81-01554

ECOLOGICAL STUDIES ON THE SUDANESE NILE SYSTEM,
Gezira Univ., Wad Medani (Sudan).
For primary bibliographic entry see Field 2E.
W81-01563

ECOLOGICAL ASPECTS OF LAKE NASSER-NUBIA,
B. Entz.
Water Supply and Management, Vol 4, No 1/2, p 67-72, 1980. 2 Fig, 1 Tab, 6 Ref.

Descriptors: *Reservoirs, *Succession, *Reservoir stages, Dominant organisms, Diptera, Insects, Lake stages, *Ecology, Vegetation establishment, Fish, *Nile River.

Succession of animal and plant communities during the first 10 years' existence of two manmade lakes, Lake Nasser and Lake Nubia, is discussed. The development and decline of chironomid swarms is compared to similar phenomena observed on other manmade lakes. Their feeding habits and their role as food for fish, toads, spiders, and other insects indicated that they played an important role as food organisms for many animals and insects. About the time the chironomid swarms diminished, large numbers of water bugs (corixids) became common. Fish in the reservoir seemed to cause the eventual disappearance of the bugs. The succession of under water plants was: algal epitecton, Chara fields, submerged macrophytes. Succession in lake shore vegetation was: Glinus lotoides and other weeds, desert plants, Tamarix nicotica, and the reappearance of river grass. Plants and animals were often the types found in the original river, and Nile flooding caused the re-introduction of several species. The possible role of the microclimate in limiting the dispersion of organisms in the two lakes is discussed. (Small-FRC)
W81-01564

THE WATER BUDGET OF LAKE QARUN AND ITS PHYSICO-CHEMICAL CHARACTERISTICS,
Economics, Statistics, and Cooperatives Services, Broomall, PA.

H. M. Bishai, and S. Y. Kirollus.
Water Supply and Management, Vol 4, No 1/2, p 93-97, 1980. 1 Fig, 1 Tab, 13 Ref.

Descriptors: *Water levels, *Reservoir stages, *Salinity, Brackish water, Reservoirs, Agricultural chemicals, Salts, Irrigation water, Nile River, *Egypt, Lake Qarun(Egypt), *Hydrologic budget.

The changing water level and the changing physico-chemical characteristics of Lake Qarun, Egypt, were investigated. Over the past 20 years the fresh water fauna of the lake have disappeared, and it is now a brackish lake with a maximum chlorosity of 19.97 g/liter. The average depth of the lake is 4 m, with a range of 2 to 8 m. Eighty-six percent of the total water budget of the lake comes from irrigation water drainage. During 1976, the lake area was 240.3 sq km and the average water level was -43.705 m below sea level. Chlorosity levels have changed over the years; Lucas measured 5.6 g/liter in 1906, Gorgy measured 13.87-16.1 g/liter in 1950-51, and Bishai and Kirollus measured 19.97 g/liter in 1978. Oxygen content ranges from 4.1 to 6.2 ml/liter, and transparency ranges from 450 cm to 705 cm. (Small-FRC)
W81-01565

PHYSICO-CHEMICAL CONDITIONS, FAUNA AND FLORA OF LAKE MANZALA, EGYPT,
Alexandria Inst. of Oceanography and Fisheries (Egypt).
A. H. Shaheen, and S. F. Yousef.
Water Supply and Management, Vol 4, No 1/2, p 103-113, 1980. 1 fig, 5 Tab, 14 Ref.

Descriptors: *Fish, *Lakes, *Water chemistry, Water analysis, Benthic fauna, Water quality, Dominant organisms, Salinity, Zooplankton, Algae, Nile River, *Egypt, *Manzala Lake(Egypt).

Because of its importance in the fisheries industry, Manzala Lake, Egypt, was studied to determine the physico-chemical conditions of the lake and its fauna and flora. Special attention was given to the effect of the cessation of the Nile flood. Oxygen content is high in the lake throughout the year. No differences were noticed in the chlorosity of the lake after the cessation of flood waters, primarily because excess drainage water has flowed into the lake. Slight lowering of chlorosity was recorded in 1967, which was attributed to the non-excavation of the sea-lake connections. The lake contributes 30% of the total fish yield for Egypt. Tilapia species fish are most abundant, followed by mullets. Zooplankton is comprised of fresh-water rotifers and cladocera and marine neritic copepods. Salinity of the water seems to control their occurrence. The algal flora of the lake is poor, with only a few of the halophytic type. A few benthonic genera and the planktonic genus Globigerina make up the foraminiferal content of the lake. (Small-FRC)
W81-01567

STUDIES ON THE CHANGES OF SOME ECOLOGICAL FACTORS AFFECTING FISH LIFE IN LAKE QARUN, FAIYUM, EGYPT,
Faculty of Science, Sohag (Egypt). Dept. of Zoology.
F. A. Boraey.
Water Supply and Management, Vol 4, No 1/2, p 99-102, 1980. 3 Tab, 7 Ref.

Descriptors: *Salinity, *Fish, *Lake stages, Marine fish, Evaporation, Irrigation water, Salts, Agricultural chemicals, Nile River, Environmental effects, Ecosystems, Ecology, Salt tolerance, *Egypt, *Lake Qarun(Egypt).

The increased salinity of Lake Qarun was investigated. Lake Qarun is located in the Faiyum Depression in the western desert of Egypt. Salinity levels in the lake have been increasing due to agricultural drainage, high summer evaporation, and low rainfall in the area. Presently the lake has the salinity level of the Mediterranean, 36-38%, and the percentage compositon of the salt is 64.97 NaCl, 16.77 MgSO4, 11.76 Na2SO4, and 3.35 CaSO4. The salinity of the lake is increasing at a rate of 0.5-0.8 g/liter annually. Salt-tolerant fish introduced into the lake will not be able to tolerate higher salt levels. Thus, the rate of increase of salinity of the lake must be decreased by salt extraction, or new fish must be introduced from the Red Sea which has a higher salt level. Fresh water fish have completely disappeared from the lake and unless further action is taken, all economically important fish will disappear from the lake. (Small-FRC)
W81-01568

IDENTIFICATION OF A DYNAMIC LAKE MODEL BY THE GROUP METHOD OF DATA HANDLING: AN APPLICATION TO LAKE ONTARIO,
Canada Centre for Inland Waters, Burlington (Ontario).
H. Tamura, and E. Halfon.
Ecological Modelling, Vol 11, No 2, p 81-100, November, 1980. 7 Fig, 4 Tab, 23 Ref.

Descriptors: *Mathematical models, *Water quality, *Phosphorus, *Lake Ontario, Lakes, Water temperature, Water pollution effects, Forecasting.

A revised algorithm of the group method of data handling was used to model and identify water quality dynamics in Lake Ontario. The variables were CHLA, volume-averaged over the top 20 m, and SRP in three layers: 0-20 m, 20-40 m, and from 40 m to the bottom. Inputs were the average quarterly temperatures for each layer as observed over ten years, and total phosphorus loadings. The simulations represented the data used quite well and also described the possible behavior of Lake Ontario when subjected to different possible loading regimes. Two kinds of models are presented: recursive and iterative. They were used to simulate long-term predictions for three different rates of phosphorus loadings. Models using the group method of data handling can be used to develop lake models at low costs in manpower and computer time. (Small-FRC)
W81-01578

FIELD INVESTIGATIONS AND MODEL SIMULATION OF THE DYNAMICS OF ZOOPLANKTON POPULATIONS IN FRESH WATERS,
Technische Univ., Dresden (German D.R.). Bereich Hydrobiologie.
W. Horn, and J. Benndorf.
Internationale Revue der Gesamten Hydrobiologie, Vol 65, No 2, p 209-222, 1980. 14 Fig, 11 Ref.

Descriptors: *Mathematical models, *Zooplankton, *Reservoirs, Productivity, *Aquatic populations, Simulations, Daphnia, Growth rates, Fecundity, Mortality.

The main parameters characterizing the dynamics of a zooplankton population in fresh waters were investigated through field tests at the Saidenbach reservoir and by means of an ecological model. Productivity of the population of Daphnia hyalina was determined using a graphic method, a numerical method which disregarded continuous change in weight increase, and an expontential model. Field investigations showed that figures characterizing biomass and net growth performance alone did not give an adequate insight into the dynamics of the zooplankton population. It was also necessary to determine gross performance. Overall, the results of field investigations and the modelling results were in good agreement. The net growth rate of Daphnia hyalina was 0.1-0.2/d at the beginning of their mass development and later took on usually negative values between 0.02 and 0.1/d. The birth rate (gross growth rate) fluctuated roughly between 0.03 and 0.1/d. High mortality rates of about 0.1/d were encountered mainly during the summer. (Small-FRC)
W81-01591

INFLUENCE OF HYDROLOGICAL FACTORS ON THE SEASONAL ABUNDANCE OF PHYTOPLANKTON IN KINJHAR LAKE, PAKISTAN,
Karachi Univ. (Pakistan). Dept. of Zoology.
S. Nazneen.
Internationale Revue der Gesamten Hydrobiologie, Vol 65, No 2, p 269-282, 1980. 5 Fig, 1 Tab, 40 Ref.

Descriptors: *Phytoplankton, *Seasonal, *Artificial lakes, Light, Temperature, Effects, Eutrophication, Phosphorus, Nitrogen, Winds, Fish, *Pakistan, Kinjhar Lake(Pakistan).

The seasonal distribution of phytoplankton in Kinjhar Lake, an artifical lake located 120 km north of Karachi, Pakistan, was investigated with emphasis on the influence of hydrological factors. The abundance of phytoplankton especially Microcystis aeruginosa, generally followed seasonal changes in light and temperature. Highest atmospheric and water temperatures were observed in May and June; minimums occurred in January. Kinjhar Lake is highly eutrophic, and nutrients were generally present in high levels throughout most of the year. During short periods when they were in short supply, phosphorus and nitrogen were limiting factors for phytoplankton. Oxygen and carbon dioxide supply in the water was uninterrupted and adequate because of continuous movement of the water due to wind. Kinjhar Lake supplies water to the population of Karachi, and it is hoped that a sufficient fish population for fishing can be developed in the lake. This study determined that phytoplankton to feed fish is available throughout most of the year, except in times of unusually low nutrient load. (Small-FRC)

Internationale Revue der Gesamten Hydrobiologie, Vol 65, No 2, p 223-247, 1980. 8 Fig, 2 Tab, 41 Ref.

Descriptors: *Predation, *Fish, *Eutrophication, Zooplankton, Phytoplankton, Effects, *Limnology, Distribution patterns, Aquatic populations, Artificial lakes, *United Kingdom.

The role of predation in causing major changes in the limnology of a hyper-eutrophic lake was investigated in a shallow man-made lake divided into two basins by an earth dam. Fertile river water fed both basins, and the water chemistry of the two basins was very similar. Initially, both areas had turbid water with heavy phytoplankton crops, cyclopoid copepods and rotifers in the zooplankton, a benthic animal community of chironomids and oligochaetes which was not diverse, and virtually no submerged or floating macrophytes. Later, the area which was more isolated from river water had clear water. Phytoplankton was sparse, and zooplankton was dominated by Cladocera. Submerged and floating macrophytes were abundant, and a relatively diverse benthic fauna developed. These changes were attributed to a large reduction in the fish population of the isolated basin due to predation by cormorants. This led to decreased fish predation on zooplankton and an increase in larger, efficiently grazing Cladocera. Reduction of fish numbers may not give the same result when the water is not flushed regularly as it was in this case. (Small-FRC)

A LIMNOLOGICAL RECONNAISSANCE OF THE LOUGH ERNE SYSTEM, IRELAND,
Ministry of Agriculture, Antrim (Northern Ireland). Freshwater Biological Investigation Unit.
C. E. Gibson, R. H. Foy, and A. G. Fitzsimons.

Internationale Revue der Gesamten Hydrobiologie, Vol 65, No 1, p 49-84, 1980. 22 Fig, 9 Tab, 24 Ref.

Descriptors: *Erne Lake(Ireland), *Lakes, *Limnology, Zooplankton, Phytoplankton, *Eutrophication, *Ireland, Algae, Chlorophyll, Aquatic life, Nutrients, Phosphates, Phosphorus compounds, Nitrates, Rotifers, Crustaceans, Copepods.

The eutrophic Erne Lake system was surveyed to document nutrient budgets, physical factors, phytoplankton, and zooplankton. The two lakes are interconnected by a channel. The upper lake is shallow with deep local areas; the lower is deep in the center and shallow near the numerous islands. Phosphorus loading in the upper lake was heavy, being related to the heavier population density in the basin. The total nitrogen to total phosphorus ratio varied widely throughout the year, rarely staying in the 'ideal' range between 20:1 and 10:1. Water temperatures, levels, and coloration are described. Phytoplankton populations in the upper lake are similar throughout, but the lower lake's population varies quantitatively and qualitatively from place to place according to depth differences. This relation between algae growth and depth was seen in a chlorophyll-a fluorometric map of the lower lake's surface. Species composition of zooplankton was similar throughout both lakes and exhibited seasonal variations. (Cassar-FRC)

AMMONIA MINERALIZATION AND CYCLING IN SHAGAWA LAKE, MINNESOTA,
Oklahoma State Univ., Stillwater. School of Biological Sciences.
D. Toetz, and B. Cole.
Archiv fur Hydrobiologie, Vol 88, No 1, p 9-23, February, 1980. 1 Fig, 8 Tab, 35 Ref.

Descriptors: *Cycling nutrients, *Ammonia, *Lakes, Euphotic zone, Eutrophication, Nitrate, Tracers, Nitrogen, Nutrients, Phosphorus, Phytoplankton, Streamflow, Precipitation, Sewage effluents, Path of pollutants, Minnesota, *Shagawa Lake(MN).

The rates of ammonia mineralization in Shagawa Lake, Minnesota, were measured by an isotope dilution method with labeled ammonium ion as tracer. Results were compared to uptake rates of nitrate and ammonia, rates of N2 fixation, and changes in ammonia concentration in the euphotic zone due to streamflow, precipitation and sewage discharge. In 1975, rates of ammonia mineralization ranged from 93 to 412 micrograms ammonia-N/liter/day. Turnover times for particulate nitrogen (PN) and ammonia pools were 0.89 and 0.21 days, respectively. The highest ammonia mineralization rates were observed after algal blooms. Total uptake was always less than mineralization, and indicated a turnover for the PN pool of 4-5 days in June and July and 18-53 days in late July and August. During early summer when algal biomass was low and photosynthesis rates were high, total uptake was highest, and 2-90% was due to N2 fixation. The ammonia input by sewage effluent was 16-150% of the ammonia uptake rate. Ammonia mineralization rates in August were assumed to be adequate to meet phytoplankton nitrogen demands. (Geiger-FRC)

SEDIMENT LOADS FROM HEADWATERS OF THE EAST-CENTRAL SIERRA WATERSHEDS,
Nevada Univ. System, Reno. Water Resources Center.
J. A. Nadolski, J. C. Brown, and C. M. Skau.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-160988, Price codes: A03 in paper copy, A01 in microfiche. Publication No 43009, 1980. 21 p, 4 Fig, 5 Tab, 34 Ref. OWRT-A-078-NEV(1) and A-088-NEV(1), 14-34-0001-7060, 9030.

Descriptors: *Sediment load, *Bed load, *Suspended load, *Forest watersheds, Forecasting, Headwaters, Runoff, Snowmelt, *Sierra Nevada, Truckee River, Carson River, Walker River.

Bedload and suspended sediments were measured for 14 forested watersheds in east-central Sierra Nevada. These are the first known bedload estimates for this region. Snowmelt produced about 90% of annual total sediment yield, and bedload accounted for 20 to 60% of snowmelt yield, stressing the need for selective but comprehensive sampling for management decisions. Empirical predictive equations, based on regression analyses of 13 independent variables, were used to predict 1979 yields. R sup 2 values averaged about 0.88 and standard errors of estimate averaged about 25%. 't' tests of: (1) % bare ground, and (2) length of channels greater than 0.1 meter, showing field evidence of flow during 1978 snowmelt, showed only the latter as significant in predicting sediment yield. This tends to confirm importance of channel network as primary sediment source and subsurface flow as the dominant runoff process. Forest Service channel rating system and channel length from USGS topographic maps were poorly related to sediment yield.

FLUVIAL GEOLOGY AND ARCHAEOLOGY OF THE HOUSATONIC RIVER VALLEY IN NORTHWESTERN CONNECTICUT,
Wesleyan Univ., Middletown, CT. Dept. of Earth and Environmental Sciences.
A. W. Burnett.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-163602, Price codes: A04 in paper copy, A01 in microfiche. BA Thesis, June, 1980. 69 p, 17 Fig, 3 Tab, 27 Ref. OWRT-A-078-CONN(1), 14-34-0001-7014.

Descriptors: *Fluvial sediments, *Geologic formations, *Recent epoch, *New England, Geologic history, Geomorphology, Rivers, Landforms, Terraces(Geologic), Bedrock, Geohydrologic units, Channel morphology, Connecticut, *Housatonic River(CT).

The Housatonic River is a glacially modified high gradient New England River that downcut to its present level at least 2500 years ago. The bedrock underlying the river valley affected the glacial development of the valley, the fluvial terrace and floodplain morphology, and the gradient of the present river channel. The low gradient reaches contain level, paried terraces; the high gradient reaches contain sloped, unpaired terraces. The highest fluvial terraces have well developed soil horizons; the lower terraces and present floodplains show no soil horizon development. The relationship of flood discharge (Q) to flood recurrent interval (r.i.), and flood height to r.i. are both direct. The flood elevation varies along the river for a given r.i.

EFFECT OF CHISEL VERSUS MOLDBOARD PLOWING ON SOIL EROSION BY WATER,
Purdue Univ., Lafayette, IN. Agricultural Experiment Station; and Science and Education Administration, Lafayette, IN.
C. B. Johnson, and W. C. Moldenhauer.
Soil Science Society of America Journal, Vol 43, No 1, p 177-179, 1979.

Descriptors: *Erosion, *Runoff, Surface residue, Rainulator studies, Infiltration, *Soil erosion, Rainfall-runoff relationships, Land use, Effects, Sediment transport, Agriculture, Plowing methods, *Soil conservation.

An experiment using simulated rainfall on a field that was chisel plowed annually for 13 years before the experiment to compare erosion from this condition with moldboard plowing in the same field. One treatment was fall moldboard plowed, a second fall chiselled with some residue left on the surface, and a third was untilled in the fall with all residue removed in the spring. All three treatments were disked lightly in the spring. After the initial experiment was completed, residue was added so that all treatments had about 20% surface cover. During the initial rain application with no residue added, soil losses from the third treatment without surface residue were the same as those from the chisel plowed and disked surface with some surface residue. Both these treatments had only 23% of the soil loss of the moldboard plowed and disked treatment. During succeeding simulated rainfall under wet and very wet soil conditions, soil loss from the disked only treatment was up to 80% of that for the moldboard-plowed treatment. When residue was added to all treatments, soil loss from the chisel-plowed treatment was less than one-half that from the moldboard-plowed treatment.

SIZE DISTRIBUTION OF ERODED MATERIAL FROM SIMULATED RAINFALL: EFFECT OVER A RANGE OF TEXTURE,
Purdue Univ., Lafayette, IN.; and Science and Education Administration, Lafayette, IN.
D. Gabriels, and W. C. Moldenhauer.
Soil Science Society of America Journal, Vol 42, No 6, p 954-958, 1978. 1 Fig, 4 Tab, 16 Ref.

Descriptors: *Rainfall, *Erosion, *Soil texture, Splash erosion, Wash erosion, Surface seal, Runoff, Soil detachment, Erosion mechanics, Rainfall simulation, Sediment transport, Particle size, Sediment distribution.

Size distribution of eroded material has implications in deposition mechanics and in carrying capacity for pollutant materials. Dispersed clay, especially the expanding lattice types, has a high carrying capacity for pollutant materials. This study reports size distributions and composition of material detached by water drops and transported in shallow flow. The size distributions of aggregates and primary particles in the splashed, washed, and seal material at different times during a laboratory simulated rainfall were compared for different textured soils. The wash had more finer material than did the splash. The wash and splash material at equilibrium were not different from the original soil, while the seal of all soils had a larger silt content than the original soils. The silt loam soil had seals with about the same clay content as the original soil, while silty clay soils had seals with less clay than the original soils. Of significance from the study is the low percentage of dispersed clay being eroded compared to the percent of clay in the original soil and that this percentage didn't change significantly with time. The most striking differences were between soils and these were influenced mainly by texture and aggregate condition of the original soils.

SOIL AND WATER LOSSES FROM CORN-SOYBEAN ROTATIONS,
Science and Education Administration, Ames, IA.
J. M. Laflen, and W. C. Moldenhauer.
Soil Science Society of America Journal, Vol 43, No 6, p 1213-1215, 1979.

Descriptors: Erosion, Runoff, *Crop rotation, Watershed projection, Sediment concentration, *Water loss, *Soil erosion, Rotations, Effects, Corn, Soybeans, *Experimental forms, Soil conservation.

It has been observed by some that there was greater soil erosion by wind and water following production of soybeans. An experiment was conducted to measure the actual erosion following soybean production compared to that following corn production. Using natural rainfall plots at Beaconfield, Iowa, soil and water losses were measured from soybeans in a corn-soybean rotation and from corn in this same rotation and grown continuously over a 7-year period. Soil losses were found to be greater following soybeans than following corn in either a corn-soybean rotation or in continuous corn. This means more precautions must be taken to control erosion when soybeans are grown on sloping lands than when corn is grown.

TRANSITIONAL PERIODIC BOUNDARY LAYER STUDY,

Iowa Univ., Iowa City. Inst. of Hydrology Research.
B. R. Ramaprian, and A. Mueller.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 106, No HY12, p 1959-1971, December, 1980. 7 Fig, 17 Ref.

Descriptors: *Flow characteristics, *Reynolds number, *Boundary layers, *Sediment transport, Flow rates, Velocity, Turbidity, Laboratory tests, Mathematical studies.

A periodic oscillatory flow was studied which closely approximated the wave boundary layer. Periodic oscillatory flows are important in the study of sediment transport and other practical hydraulic and coastal engineering topics. Sediment transport is very sensitive to the bed shear stress and therefore to the nature of flow in the wave boundary layer. The experiments indicated that this type of flow can be turbulent at a Reynolds number considerably lower than the critical value for transition for flow over an oscillating flat plate. Detailed velocity measurements were made using laser Doppler nemometry and a digital data acquisition technique which isolated and measured the periodic and random components of the velocity. The behavior of the periodic aspect of the transitional flow was only slightly different from that predicted for a laminar periodic flow at the same oscillation frequency. The turbulent intensities were significant, but were lower than those for fully turbulent boundary layers. (Small-FRC)

SEDIMENT RUN-OFF FROM THE CATCHMENT AREA OF THE CARPATHIAN RIVERS,
Institute of Meteorology and Water Management, Warsaw (Poland).
J. Branski.
Acta Hydrobiologica, Vol 22, No 1, p 89-100, 1980. 1 Fig, 10 Ref.

Descriptors: *Erosion rates, *Rivers, *Sediment yield, Sediment transport, Runoff, Silts, Equations, Watersheds(Basins), Sediments, Water pollution sources, *Poland, Carpathia.

Measurements of sediment load of the Carpathian rivers (Poland) were used to estimate sediment runoff from the catchment area. Measurements of the silt charge (concentration of suspensions in water expressed in g/cu m) and daily water yields were used to calculate the silt charge. Formulae are presented for calculating indices of sediment runoff. Indices of the load of suspension runoff were calculated from the average annual load of suspension discharge in the cross sections of 22 rivers. The indices range from 30 t/sq km to 160 t/sq km. The indices of sediment runoff can be used for rating the erosion processes in the catchment basin. The intensity of erosion is closely connected to the amount of silt in a river. The indices are more reliable than other methods for giving a spatial distribution of this phenomenon. (Small-FRC)

SEDIMENTATION PROCESSES IN THE RESERVOIR LAKE NASSER-NUBIA DURING 1965-1974 AND FUTURE ASPECTS,
B. A. G. Entz.
Water Supply and Management, Vol 4, No 1/2, p 63-66, 1980. 6 Ref.

Descriptors: *Reservoir silting, *Reservoirs, *Mollusks, Mussels, Sediment transport, Lakes, Sedimentation rates, Currents(Water), *Sediment load, *Egypt, Lake Nasser-Nubia(Egypt).

The sedimentation problems in the manmade reservoir Lake Nasser-Nubia were investigated to determine the future of the lakes. The areas of sedimentation, their extension, and their main characteristics were determined, along with the effects of currents. Changes in benthos, particularly molluscs and oligochaetes, since the formation of the lakes were also studied. The bulk of suspended silt was sedimented around the previous second cataract, and the layers were already 10 to 25 m thick in 1974. Heaviest sedimentation took place beside the old river channel in the northern part of the lakes, while north of Wadi Halfa the heaviest sedimentation was in the old river channel itself. There was some correlation between the rate of sedimentation and the stratification of molluscs. In the southern area with a well-defined river bed, there were more than 100 living mussels per sq m. There were no mussels in the central sedimentation area. Only empty shells were found in Lake Nasser, which has poor oxygen levels. (Small-FRC)

CONTRIBUTION TO THE STUDY ON BOTTOM SEDIMENT IN LAKE BALATON. I. DETERMINATION OF PHOSPHORUS MINERALS IN THE SEDIMENT,
Research Inst. for Water Resources Development, Budapest (Hungary). Inst. for Water Quality Control.
E. Dobolyi, and G. Bidlo.
Internationale Revue der Gesamten Hydrobiologie, Vol 65, No 4, p 489-497, 1980. 8 Fig, 3 Tab, 26 Ref.

Descriptors: *Phosphorus, *Lake sediments, *Bottom sediments, *Water pollution sources, Mineralogy, X-ray diffraction, Eutrophication, Electron microscopy, Lakes, Hungary, Lake Balaton.

Chemical, electron microscope, and X-ray diffraction analysis were used to determine the presence of phosphorus containing minerals in the bottom sediment of Lake Balaton. The research was intended to demonstrate whether bottom sediment acted as a sink or source of phosphorus in the eutrophicated lake. A 10 cm thick sediment sample was taken at mid-lake in 4 m of water off Balatonszemes. The phosphorus content of 500-600 microgram/g proved relatively low, and phosphorus bearing minerals were not detected in the original sample under the electron microscope or by X-ray diffraction. The sample was then divided into fractions according to light or heavy mineral density, and was further analyzed using chemical and physical methods. In an enriched sample, the amount of calcium-bound phosphorus was increased to about 50 times the original concentration. In this sample, the presence of hydroxyapatite was found with the electron microscope, and hydroxyapatite and fluoroapatite were found using X-ray diffraction. No other phosphorus minerals were found. (Small-FRC)

EXPERIMENTS ON THE SIGNIFICANCE OF FLOCCULATION IN THE SETTLING OF FINE-GRAINED SEDIMENT IN STILL WATER,
Bedford Inst. of Oceanography, Dartmouth (Nova Scotia). Atlantic Oceanographic Lab.
K. Kranck.
Canadian Journal of Earth Sciences, Vol 17, No 11, p 1517-1526, November, 1980. 6 Fig, 1 Tab, 26 Ref.

Descriptors: *Flocculation, *Settling velocity, *Sedimentation rates, Sediment sorting, Suspended solids, Sedimentology, Stokes Law, Particle size, Turbidity.

The effects of concentration, average grain size and sorting, and mineralogy on the settling rate of fine-grained sediment in still water as flocs and as single grains were studied. Both distilled water and saline solutions were used. In a flocculated suspension the decrease in concentration of a sediment with time was a function of the minus four-thirds power of the time. In salt water, single grain settling dominated over floc settling at lower concentrations. After an initial period, suspensions with different concentrations of suspended sediment attained equal concentrations. Flocs were composed of a mixture of grain sizes in proportion to their distribution in the suspension, all of which had lower settling rates than the floc. The size distribution of sediment remaining suspended after settling was the same as at the start, with the exception of some particles which settled out as single grains. Floc settling behavior was similar among different minerals of similar grain-size characteristics. (Cassar-FRC)

QUESTIONS ABOUT DREDGING AND DREDGED MATERIAL DISPOSAL IN LONG ISLAND SOUND.
State Univ. of New York at Stony Brook. Marine Sciences Research Center.
Special Report 28, Reference 79-11 (1979). 136 p, 7 Fig, 7 Tab, 52 Ref, Append. Edited by J. R. Schubel, W. M. Wise and J. Schoof.

Descriptors: *New York, *Connecticut, *Dredging, *Estuaries, *Sedimentation, Turbidity, Tides, Mud, Particle size, Saline water-freshwater interfaces, Aquatic environment, Biomass, Currents(Water), Sediment distribution, Dissolved oxygen, Photosynthesis, *Long Island Sound.

A question and answer format provides a history of dredging and dredged material disposal, an assessment of its effects on the Sound and its biota, an examination of alternative modes of disposal and a discussion of research priorities. Three types of disposal areas are used for dredged material but the majority is dumped at open-water sites within the Sound. Since 1954, 80% of the dredged material has been disposed of at four sites. Three kinds of dredges---suction-cutterhead, hopper, and crane and bucket---are used, depending on the nature and location of the site, and the bidding process. There is concern that if contaminated dredged materials are physically, chemically or biologically reactive on long-term scales, adverse impacts on water quality and biota could occur. Short to intermediate impacts, however, have not been demonstrated. Reductions in benthic abundance, total biomass and species diversity usually occur after deposition of dredged material although repopulation is usually complete within 1 to 1 1/2 years. The type of dredged material, ranging from relatively clean to potentially hazardous, can affect this rate. The Army Corps of Engineers and the Environmental Protection Agency have adopted guidelines for evaluating dredged material and New York and Connecticut have both developed water quality standards pursuant to the 1972 Federal Water Pollution Control Amendments. Permits and certifications must be obtained from these agencies to carry out a dredging project. (Atkins-Omniplan)
W81-01432

QUESTIONS ABOUT DREDGING AND DREDGED MATERIAL DISPOSAL IN THE CHESAPEAKE BAY.

State Univ. of New York at Stony Brook. Marine Sciences Research Center.
Special Report 20, Reference 79-3 (1979). 143 p, 10 Fig, 10 Tab, 53 Ref, Append, 4 Maps. Edited by J. R. Schubel and W. M. Wise.

Descriptors: *Maryland, *Dredging, *Estuaries, *Sedimentation, *Chesapeake Bay, Turbidity, Density currents, Bottom organisms, Sand bars, Dissolved oxygen, Streamflow, Channels, Commercial fishing, Sport fishing, Aquatic habitats, Environmental effects.

The history of dredging and dredged material disposal in the Maryland portion of the Chesapeake Bay, an assessment of its effect on the Bay and its biota, an examination of alternative modes of disposal and a general discussion of research priorities is provided in a question-and-answer format. Agriculture, urbanization and other disturbances of the soil increase the rate of soil erosion and sediment to streams. Since 1870, nearly 82 million cubic yards of material has been removed from Baltimore Harbor Channels, 25% of which has been for maintenance purposes. Three common kinds of dredges are used---suction-cutterhead, hopper, and bucket and scow; the choice is determined by the nature and location of the disposal area and by economics. Environmental concerns regarding dredging include removal of benthic organisms, possible release of oxygen-consuming substances, release of nutrients causing increased phytoplankton production, release of toxic substances, and turbidity. Contaminated deposits may be mobilized and released in a variety of ways; however, the mobilization can be reduced. At disposal sites recolonization begins within a few weeks and is usually completed within 1 to 1-1/2 years. Large-scale dredging has concerned the public, but small to medium projects should be more carefully assessed for their cumulative effect. Monitoring of dredged material and disposal operations is necessary. (Atkins-Omniplan)

A SIMULATION MODEL OF ESTUARINE SUBSYSTEM COUPLING AND CARBON EXCHANGE WITH THE SEA. II. NORTH INLET MODEL STRUCTURE, OUTPUT AND VALIDATION,
South Carolina Univ., Columbia. Belle W. Baruch Inst. for Marine Biology and Coastal Research.
J. K. Summers, W. M. Kitchens, H. N. McKellar, Jr., and R. F. Dame.
Ecological Modelling, Vol 11, No 2, p 101-140, November, 1980. 11 Fig, 5 Tab, 62 Ref.

Descriptors: *Mathematical models, *Carbon, *Energy, *Estuaries, Flow, Model studies, Water temperature, Ambient light, Sea level, Mixing, Freshwater, Sea water, South Carolina.

A first-stage verified model of carbon/energy flux through the North Inlet marsh and estuarine system (Georgetown County, South Carolina) is presented. Forcing functions include sunlight, water temperature, remixing, and sea level. Equations are presented for gross primary production, respiration, egestion, excretion, migration, exchange between the marsh and the water column, organism mortality, tidal remixing, and energy balances. Initial conditions and flows are presented, and validation of the model is discussed. Sixteen of the 21 output variables were validated. The time series output for model compartments and overall system carbon flow were compared with observed data collected over the past ten years. The model is stable and can broadly reproduce some of the major trends of a salt marsh-estuarine system. (Small-FRC)

A NUMERICAL MODEL OF THE JAMES RIVER ESTUARY, VIRGINIA, U.S.A.,
Commonwealth Scientific and Industrial Research Organization, Vronulls (Australia). Div. of Fisheries and Oceanography.
J. S. Godfrey.
Estuarine and Coastal Marine Science, Vol 11, No 3, p 295-310, September, 1980. 6 Fig, 11 Ref.

Descriptors: *Computer models, *Estuaries, *Salinity, Density currents, Flow, Tides, Model studies, Rivers, *James River(VA), Virginia, Tidal effects, *Saline water-freshwater interfaces.

A numerical model is proposed of a partially mixed estuary, using as an example the James River Estuary (Virginia). Temporal changes in density current and vertical salinity stratification at a given point depend only on the longstream gradient of cross-sectional average salinity and the tidal speed averaged over the tidal period. The qualitative features of the solution are similar to those of real and laboratory model partially mixed estuaries. The simplicity of the model is demonstrated by the fact that a 62 day model run on the James River Estuary took only 2 seconds on a CDC-7600 computer. There was good agreement between the data set and the model. A surprising feature of the investigation was that the estuary responded rapidly and strongly to changes in salinity at the mouth. This is more important than changes in river flow or tidal speed in establishing variation in the cross-sectional average salinity in the James River. The physical reason for this is obscure. The model does not work for well-mixed estuaries or when the upstream influx of salt by tidal-induced eddies is considered. (Small-FRC)

VELOCITY SURGES AND ASYMMETRY IN TIDAL CHANNELS,
Hull Univ. (England). Dept. of Geography.
J. S. Pethick.
Estuarine and Coastal Marine Science, Vol 11, No 3, p 331-345, September, 1980. 8 Fig, 4 Tab, 11 Ref.

Descriptors: *Tides, *Water circulation, *Velocity, Mathematical models, *Estuaries, Channel morphology, Flow, United Kingdom.

A simulation model of tidal velocity based on morphological data collected in the Stiffkey marshes, Norfolk, is presented. Velocities predicted by the model are compared with field measurements taken at two stations on the marsh. Velocity surges appear to be a feature controlled by the three-dimensional geometry of the channel or channel system and independent tidal stage inputs. Two inputs necessary for velocity simulation are tidal data, one bankfull and the other 0.4 m overbank, and morphological data obtained by aerial photographs and mapping of the channel system. Shallow water asymmetric tides are responsible for velocity asymmetry, and the branching network of the channel system is primarily responsible for the position and strength of the velocity surges. Maximum surges are associated with the vastly increased discharge rates in channels as overbank tides spill into the marsh surface. Velocity in tidal marshes may be a useful indicator of the maturity of a channel system. (Small-FRC)

THERMALLY-INDUCED AIR AND WATER CIRCULATIONS IN ESTUARINE RIVERS,
Old Dominion Univ., Norfolk, VA. Dept. of Physics.
K. P. Chopra.
Estuarine and Coastal Marine Science, Vol 11, No 3, p 353-357, September, 1980. 1 Fig, 1 Tab, 5 Ref.

Descriptors: *Water circulation, *Mathematical models, *Estuaries, Heat transfer, Convection, Air circulation, Currents(Water), Currents(Air), Flow, Salinity, Winds, Rivers.

A physical theoretical model is presented which explains and predicts thermally induced air and water circulations introduced by contrasts in surface temperatures over an estuarine water and adjoining land mass. Air over an estuarine river is generally cooler than that over land, particularly during the summer days. This is because enhanced evaporative and radiative heat loss are caused by flow and convective transport of heat from subsurface layers. Temperature gradients in estuarine areas are larger than those encountered in sea breezes and cause stronger winds with deeper circulation cells. Increased salinity combined with these winds may induce a backward drift of surface water where downwelling occurs. Since there is no systematically recorded data, comparison of modelling results with field data is not possible. It is proposed that the friction constant for estuarine air probably exceeds 0.0001 per m. (Small-FRC)

CONTROL OF A FJORD BASIN'S DYNAMICS BY TIDAL MIXING IN EMBRACING SILL ZONES,
Evans-Hamilton, Inc., Seattle, WA.
C. C. Ebbesmeyer, and C. A. Barnes.
Estuarine and Coastal Marine Science, Vol 11, No 3, p 311-330, September, 1980. 13 Fig, 34 Ref.

Descriptors: *Tidal effects, *Fjords, *Water circulation, Mixing, Sea water, Washington, Currents(Water), Coasts, Freshwater, Flow, Hydraulic properties, Sills, *Puget Sound(WA).

The dynamics of a large fjord basin lying between comparatively deep sills where tidal mixing is vigorous, Puget Sound's Main Basin, were studied. Tidal action over the 44 m (landward) and 66 m (seaward) sills caused a vigorous two-layer circulation in the basin where no net motion occurred near the average depth of the embracing sills. In the case of a flood tide, upper-layer water was downwelled at the seaward sill and lower-layer water was upwelled at the landward sill. This circulation is quite active at all basin depths throughout the year. Currents were computed from differences in dissolved oxygen between hydrographic stations, and compared well with measured currents. Bulk residence time in the lower layer was found to be about three weeks, a short time for so large a fjord. The water blend in the basin averages about 90% oceanic water and 10% fresh water. The basin showed marked sensitivity to tidal action in the sill zones. Transport in the upper layer was directly proportional to the tidal prism inland of the landward sill zone, and there was an exponential response to abrupt changes in freshwater flowing into the seaward sill zone. Estuarine and Coastal Marine Science, Vol 11, No 5, p 537-545, November, 1980. 9 Fig, 1 Tab, 13 Ref.

Descriptors: *Fungi, *Estuaries, *Mixing, Sediment transport, Bioindicators, Microorganisms, Long Island Sound, *Thames River(CT), Connecticut, Soil fungi, Saline water-freshwater interfaces, River flow, Seasonal.

Terrestrial microfungi were used as bioindicators to study the movement of water and sediment in the Thames River Estuary, Long Island Sound. Samples collected at 6 stations in the river and in the sound east of the river mouth from February 1974, to August, 1976, revealed seasonal distribution patterns, reaching a maximum count in Nov.-May and a minimum in June-Sept. River bottom samples contained fewer colony-producing organisms than surface river water. The pH and concentration of total suspended matter had no significant effect on distribution of fungi. Temperature, precipitation, river discharge, and salinity showed correlation with fungi counts and are the major factors affecting dispersion of fungi. Movement and dispersion of microfungi were observed during mixing of river water and saline water. (Cassar-FRC)

APPARATUS FOR DESALINATING WATER,
R. E. Diggs.
U.S. Patent No 4,199,407, 18 p, 21 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 993, No 4, p 1359-1360, April 22, 1980.

Descriptors: *Patents, *Desalination, *Desalination apparatus, *Solar radiation, Heat exchange, Separation techniques, Evaporation, Condensation, Equipment.

The saturation temperature of the contaminated water being vaporized by the distillation apparatus is very low as compared to the saturation temperature at atmospheric pressure. Furthermore, condensation of the water vapor occurs at, or near, atmospheric pressure and therefore the water vapor is at, or below, the saturation temperature of water at atmospheric pressure. Solar energy can be utilized to supply sufficient heat input to raise the temperature of large quantities of contaminated water to above the saturation temperature required in the vaporization process occurring in the evaporation chamber. The water vapor is then transferred to a condensation chamber where the pressure is at, or near, atmospheric pressure, hence less heat has to be removed from the water vapor to condense it, and the condensation step occurs quite rapidly. Once vaporized, the waver vapor and the dissolved solids are separated, and the vapor is condensed in a separate chamber, thereby substantially reducing the possibility of recontamination of the distillate with solids which have been removed from the cater by the distillation process. (Sinha-OEIS)
W81-01463

APPARATUS FOR DESALINATING WATER,
R. E. Diggs.
U.S. Patent No 4,199,406, 18 p, 21 Fig, 6 Ref; Official Gazette of the United States Patent Office, Vol 993, No 4, p 1359, April 22, 1980.

Descriptors: *Patents, *Desalination, *Desalination apparatus, *Solar radiation, Heat exchange, Separation techniques, Evaporation, Condensation, Equipment.

Contaminated water flows across a grid and into a storage tank. The grid utilizes solar energy to heat that water to a predetermined temperature. A heat transfer structure which is dome-shaped and receives water from the storage tank and a preheater utilizing solar energy heats the water to a further predetermined temperature. An evaporator receives the heated water and exposes it to a vacuum condition so that the temperature of the water is above the saturation temperature. The water is thus vaporized and dissolved solid contaminants are separated. The solids are deposited on moving belts and moved into a solids removal system. The solids removal system comprises trap door pairs upon which the solids are deposited and which are sequentially opened so that the vacuum conditions existing in the evaporator are not disturbed. The water vapor is removed and transfered to the heat transfer structure where it is condensed for form distillate. The distillate is transfered to a collection area. (Sinha-OEIS)

DEVELOPMENT OF COMPOSITE HOLLOW FIBERS--PHASE II,
Bend Research, Inc., OR.
W. C. Babcock, R. W. Baker, R. P. Barss, G. C. Corson, and B. A. Kruse-Smith.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-161010, Price codes: A03 in paper copy, A01 in microfiche. Final Report to Office of Water Research and Technology, Sept. 15, 1980. 31 p, 13 Fig, 6 Tab, 11 Ref. OWRT-C-90261-D(No 9521)(1), 14-34-0001-9521.

Descriptors: *Membranes, *Desalination apparatus, Desalination processes, Reverse osmosis, Osmotic pressure, *Composite membranes, *Hollow fiber membranes, *Inside-skinned membranes, *Membrane modules, Hollow fiber modules.

The report describes the results of a program to develop inside-skinned, composite hollow fibers for brackish-water desalination by reverse osmosis. In a previous program, polysulfone hollow fibers were developed that have sufficient strength to withstand 400 psi internal pressure. During this program, minor improvements were made in the polysulfone fibers and a procedure was developed for reliably coating the lumen surfaces of the fibers with an NS-100 membrane. Modules containing several hundred fibers and having a combined membrane area of 1 sq ft exhibited rejections in excess of 90% and fluxes of 5 to 20 gfd at 400 psi with 0.5 wt% NaCl. The best module performance was 98.1% NaCl rejection and a flux of 13.4 gfd.

PROJECT SKYWATER, DATA MANAGEMENT USERS GUIDE,
Water and Power Resources Service, Denver, CO. Office of Atmospheric Resources Management.
Report, July, 1980. 22 p, 4 Fig.

Descriptors: *Cloud seeding, *Water supply development, *Data collections, *Weather data, Weather modification, Data storage and retrieval, Meteorological data, Management, Precipitation(Atmospheric), Remote sensing.

Project Skywater is a comprehensive research program designed to develop additional water supplies by cloud seeding techniques. About 70% of the program is conducted through contracts with universities, private firms, and local, state, and Federal agencies. The various Skywater projects produce large quantities of data. Data sources include radar, satellite, rawinsondes, precipitation gages, cloud physics aircraft, and automated weather stations. Since 1975, thousands of computer tapes have been used to record data. To assure that high quality data are archived on the Skywater data base in a timely manner, data management influences must be applied throughout all phases of activities: development of request for proposal, contract, work plan, data collection, data processing, and archival. The objectives of data management are: to develop and maintain a Skywater data base management system with quality controlled, space-efficient archival techniques, and fast, simple retrieval procedures which are cost-effective and reliable, to maintain a current inventory of data collected and their archival status; and to provide data to analysts as requested. ANALYSIS OF DIGITIZED M-33 RADAR DATA FROM TEXAS HIPLEX, 1976-1978,
North American Weather Consultants, Salt Lake City, UT.
J. L. Sutherland, H. R. Swart, and D. A. Griffith.
Final Report, Volume 1 prepared for Texas Department of Water Resources, November, 1980. 85 p, 11 Fig, 22 Tab, 13 Ref. 14-0013.

Descriptors: *Texas, *Cloud seeding, *Radar, *Precipitation(Atmospheric), Weather modification, Clouds, Fronts(Atmospheric), Meteorological data, Data collections, Rainfall.

The Texas High Plains Experiment (HIPLEX) is a weather-oriented research effort intended to reduce the scientific uncertainties of beneficial and acceptable management of precipitation from summer cumulus clouds. Digitized M-33 radar data were analyzed to examine cloud seeding effects, produce an echo summary, generated hourly radar-derived rainfall maps, and determine environmental controls on echo occurrence. Possible seeding effects were detected in terms of increases in echo volume and area. Problems with radar data quality and a lack of randomization compromise the seeding analysis. A total of 11,207 echoes were detected. About 90% were convective cells, with warm-topped cells outnumbering coldtopped cells by two to one. About ten% of the echos were clusters (three or more reflectivity peaks). Fourteen line echoes were observed. In spite of their relative infrequence, lines were the dominant echo in terms of echo area, height, reflectivity and duration. Clusters were ranked next. Line echoes generally occurred with 500 mb troughs and along surface fronts. Clusters occurred under all weather patterns, although they were somewhat more frequent near (but not along) fronts. Days with cells only (no clusters or lines) were all non-frontal. Soundings near cells were relatively drier at all levels and also more unstable than soundings near clusters or lines. The mean top of the positive area deduced from soundings near lines was 75 mb greater (about 1 km lower) than the corresponding mean for cells. (Moore-SRC)

3C. Use Of Water Of Impaired Quality

SEWAGE FARMING IN IRAQ: A POTENTIAL HAZARD FOR POLLUTION,
Environmental Pollution Research Center, Baghdad (Iraq).
S. M. Mutlak, Y. A. Hamdi, M. A. Nour, N. Bakal, and M. Al-Gazzaly.
Journal of Environmental Quality, Vol 9, No 4, p 677-680, October/December, 1980. 3 Fig, 2 Tab, 10 Ref.

Descriptors: *Sewage bacteria, *Irrigation practices, Coliforms, Aerobic bacteria, Irrigation, Sewage effluents, Liquid wastes, *Path of pollutants.

Microbial pollution problems associated with the use of raw sewage for agricultural purposes in Iraq are investigated. Composite samples of 10 individual surface and subsurface soil samples were taken from a sewage-irrigated farm near Baghdad. The soil was classed as fine silty. Some samples were incubated at 10 and 37C for 5 wk. Lettuce plants were obtained from the farm during a 9 wk period. Average total aerobic bacterial counts in different samples were 4000000 cells/g for surface and subsurface soils, and 450000000 cells/ml for sewage. Average counts of coliform were 400000 cells/g for surface and subsurface soils, and 3400000 cells/ml for sewage. The population of fecal streptococci was 6000 cells/g for surface soil, 4000 cells/g for subsurface soil and 17000 cells/ml for sewage. In general the sewage contained higher populations of total bacteria, coliforms and fecal streptococci than did the soils. Coliforms were present in the lettuce plants with an average of 4, 24, and 43 cells/g of tissue for the inner leaves, outer leaves, and head, respectively. These results indicate that the use of untreated sewage for agricultural purposes is hazardous and safety measures must be taken. (Baker-FRC)

WATER SUPPLY PROBLEMS OF THE CITY OF MOSUL, AN EXTENSION OF THE ANCIENT CITY OF NINEVAH,
Mosul Univ. (Iraq). Coll. of Engineering.
F. Y. R. Agha, T. A. Mahmoud, and S. Ahmad.
Water Supply and Management, Vol 4, No 3, p 129-137, 1980. 6 Fig, 3 Tab, 15 Ref.

Descriptors: *Water yield improvement, *Water supply development, *Water shortage, Water management(Applied), Water supply, Water allocation(Policy), Water rates, Water utilization, *Iraq, *Mosul(Iraq).

The city of Mosul (Iraq) has grown rapidly, and the existing water supply falls short of the demand particularly in the summer months. A study was conducted to identify the major factors which affect the present water supply, to estimate the future water requirements of the city, and to suggest ways and means to meet the city's water needs. Presently, water is withdrawn from the river, treated, and piped to the city. Population growth was estimated, and the overall water demand was estimated to increase at about 3% per year. The installation of a raw water supply system for watering lawns and public gardens, and attempts to eliminate waste and leaks, will reduce the demand for treated water. Proper metering and realistic pricing of treated water will help end waste. A third water treatment plant which will supply 198,000 cu m of treated water per day will be completed in 1980. But even with this new plant, Mosul demand will exceed the water supply by 1992. (Small-FRC)

3F. Conservation In Agriculture

IRRIGATION HOSE,
Sumitomo Chemical Co. Ltd., Osaka (Japan). (Assignee).
S. Kojimoto, T. Sato, J. Ono, T. Mori, and S. Suzuki.
U.S. Patent No 4,199,106, 8 p, 10 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 993, No 4, p 1259, April 22, 1980.

Descriptors: *Patents, *Irrigation, *Application equipment, Hoses, Irrigation practices, Irrigation efficiency, *Drip irrigation.

An irrigation hose is produced by melt-sticking double thermoplastic resin film in a plane along longitudinal parallel lines so as to form two to three passages, one a supply passage and other being constant pressure passages. The supply passage is connected to each constant pressure passage by communicating holes which are formed by non-melt-stuck portions spaced in the melt-stuck line between both passages. The constant pressure passage has water-irrigating holes which are formed by non-melt-stuck portions spaced in an outside melt-stuck line. The improvement comprises making small melt-stuck portions in the vicinity of the communicating holes and/or water-irrigating holes. This assures uniform water-irrigation on both level and sloping fields. (Sinha-OEIS)

LOW VOLUME SPRAY DEVICE FOR SURFACE IRRIGATION SYSTEM,
Olson Irrigation Systems, Santee, CA. (Assignee).
D. Olson, and R. P. Georges.
U. S. Patent No 4,199,105, 4 p, 4 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 993, No 4, p 1259, April 22, 1980.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, Application equipment, Irrigation practices, Irrigation efficiency, Nozzles.

A low volume spray device for irrigation systems has a lower tubular end portion that is beveled to facilitate its insertion into a plastic conduit. Its upper end forms a nozzle portion with a small orifice and a deflector that controls the spray pattern. The device is preferably molded from plastic material so as to be inexpensive yet long lasting. (Sinha-OEIS)
W81-01451

CONTROLLED THRUST, ROTARY, ADJUSTABLE TOPOGRAPHY SPRINKLER,
R. A. Rodriguez.
U.S. Patent No 4,198,001, 9 p, 11 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 993, No 3, p 889, April 15, 1980.

Descriptors: *Patents, *Irrigation, *Sprinkler irrigation, Application equipment, Irrigation practices, Irrigation efficiency, Nozzles.

This invention pertains to irrigation devices capable of varying their irrigation patterns. It achieves the desired effects through the use of only five major moving parts arranged about a central hollow cylindrical frame. Two parts comprise the main irrigation mechanism; a hollow rotary unit that holds a rotary nozzle, and the nozzle which is mounted on the rotary unit at a slight radial distance from its axis of ration and in a manner such that the irrigation jet thrust produces a rotating torque on the hollow rotary unit. Two other parts comprise the main mechanisms for harnessing and controlling the resultant force of irrigation jet and its induced torque, a torque buffing impeller and its connecting means to the rotary unit. An additional moving part, a nozzle rotation restrainer mounted on the hollow rotary units acts on the nozzle to restrain its rotation during particular motions. A fixed one piece adjustable contour plate consists essentially of the contour surface, which via a contact leg extending from the nozzle and riding on its surface its countour variations are transmitted into nozzle rotation. (Sinha-OEIS)
W81-01461

SOIL MOISTURE SAMPLER AND CONTROLLER,
J. D. Neal.
U.S. Patent No 4,197,866, 8 p, 2 Fig, 12 Ref; Official Gazette of the United States Patent Office, Vol 993, No 3, p 844, April 15, 1980.

Descriptors: *Patents, *Irrigation systems, *Soil moisture, Measurement, Automatic control, Electronic equipment, Temperature, Irrigation efficiency.

Periodically, the soil moisture sampler and controller automatically activates in-ground probe(s) to measure the soil moisture. The resulting output signal indicative of the soil moisture is adjusted for soil ambient temperature and compared to a pre-set soil moisture is less than a pre-set value, an irrigation timer is activated which causes the soil to be irrigated for a preselected time interval. (Sinha-OEIS)

IRRIGATION EFFICIENCY AND CONTROLLED ROOT-ZONE WETTING IN DEEP SANDS,
Florida Univ., Gainesville. Water Resources Research Center.
L. C. Hammond, R. S. Mansell, W. K. Robertson, J. T. Johnson, and H. M. Selim.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-161036, Price codes: A05 in paper copy, A01 in microfiche. Publication No 52, 1981. 80 p, 31 Fig, 26 Tab, 16 Ref, 1 Append. OWRT A-034-FLA(2), 14-34-0001-9010.

Descriptors: *Irrigation efficiency, *Deep sands, *Controlled root-zone wetting, Evapotranspiration, Drainage, Subsurface asphalt barrier, Sands, *Crop response, Irrigation practices, Corn, Soybeans, Peanuts, *Florida, Gainesville(FL), Live Oak(FL).

Ten field water management experiments were conducted with corn, soybeans and peanuts during 1977, 1978, and 1979 on well-drained sandy soils at Gainesville and Live Oak. Irrigation scheduling treatments varied from one to eight per experiment. A simple computer simulation model provided an estimate of seasonal evapotranspiration (ET), drainage, and change in soil storage. These data and calculated water use efficiencies served as a test of the effectiveness of various irrigation scheduling strategies, and provided information on crop response to water stress. Yields increased linearly with estimated ET. Regression of corn yields on estimated ET gave the following 3-year average results for Gainesville and Live Oak, respectively: $Y = 661X - 22,895$ ($R \text{ sup } 2 = 0.90$), $Y = 471X - 12,964$ ($R \text{ sup } 2 = 0.73$), where Y is grain yield, kg/ha-cm, and X is ET, cm. These findings were interpreted to mean that the most efficient crop production use of water is obtained when water is supplied to meet the full seasonal ET needs imposed by the atmosphere. In addition, a strategy of light, frequent irrigation of only the top 30 cm of sandy soils will produce high yields with minimum deep seepage loss of water and nutrients.
W81-01467

EFFECTS OF IRRIGATION REGIMES ON YIELD AND WATER USE OF SNAP BEAN (PHASEOLUS VULGARIS L.),
Georgia Coastal Plain Experiment Station, Tifton.
J. R. Stansell, and D. A. Smittle.
Journal of the American Society of Horticultural Science, Vol 105, No 6, p 869-873, November, 1980. 5 Fig, 6 Tab, 12 Ref.

Descriptors: *Irrigation efficiency, *Beans, *Evapotranspiration, Consumptive use, Irrigation effects, Soil moisture, Soil-water-plant relationships, Plant growth, Water requirements.

Two snap bean cultivars, Galagreen and Eagle, were grown as spring and fall crops in water-protected irrigation plots. Differences in water use were not significant in spring and fall crops (169 and 180 mm) or in cultivars (173 and 176 mm), but Eagle produced more than double the yield of Galagreen. Pod yield was greatest when beans were continually irrigated at a soil water tension of 25 kPa. Irrigation when soil water tensions reached 50 and 75 kPa reduced pod yields by 41 and 47% respectively. Snap beans were adversely affected by a water stress of 75 kPa at any one stage of growth: pre-bloom, bloom, and post-bloom. The most efficient water use was the 25 kPa treatment, which produced 0.62 MT per mm. Application of water at soil water tensions of 50 and 75 reduced water use efficiency by 27 and 35%. Daily evapotranspiration rates in mm were: 25 kPa treatment, $1.52 + 0.05x$ (where x is the age of the plant in days); 50 kPa treatment, $0.515 + 0.054x$; and 75 kPa treatment, $0.567 + 0.046x$. The mean daily rate of evaporation was 4.88 cm per day. Relationships of evapotranspiration to evaporation from an open pan were determined and can be used to accurately schedule irrigation. (Cassar-FRC)

FURROW EROSION AND SEDIMENT LOSSES ON IRRIGATED CROPLAND,
Science and Education Administration, Kimberly, ID. Snake River Conservation Research Center.
R. D. Berg, and D. L. Carter.
Journal of Soil and Water Conservation, Vol 35, No 6, p 267-270, November/December, 1980. 6 Fig, 2 Tab, 8 Ref.

Descriptors: *Erosion, *Channel erosion, *Furrow irrigation, *Irrigation ditches, *Sediment transport, Idaho, Slopes, Phosphorus, Sugar beets, Cereal crops, Alfalfa, Cultivated lands, Erosion control, Cover crops, Soil stabilization, Strip cropping, Irrigation practices, Water conveyance.

Between 0.2 and 63.0 tons per acre of sediment were lost during one irrigation season from furrow irrigation on 49 Idaho farms studied. Erosion was worst in fields planted with row crops and with slopes exceeding 1%. Cereal crops lost one-tenth the sediment compared with row crops, and alfalfa accumulated sediment. Phosphate losses generally followed sediment losses with a few fields losing

excessive amounts of phosphates. Surface runoff exceeded 30% in most fields, indicating that furrow stream inflow was excessive. Early season irrigation caused more erosion than later because plants and root systems stabilized the furrows. Erosion and phosphorus losses may be minimized by avoiding row crop irrigation on steeper slopes, controlling furrow stream size, keeping the tailwater ditch shallow, maintaining a vegetative filter strip (grasses, alfalfa, cereals), constructing sediment retention basins, irrigating every other furrow where possible, seeding crops directly in furrows, and using herbicides to reduce cultivation requirements. (Cassar-FRC)

STORMWATER DETENTION BASINS MUST CONTROL MORE THAN RUNOFF,
Mosquito Extermination Commission, Morris County, NJ.
F. G. Schimmenti.
American City and County, Vol 95, No 12, p 41-42, December, 1980.

Descriptors: *Storage, *Storm runoff, *Urbanization, Design flow, Water pollution, Pondage, Settling basins, Storm water, Urban runoff, Design, Design criteria, Project planning, Engineering structures, Spillways, Overflow, Pipes, Weirs.

Various facilities have been designed to detain stormwater runoff to prevent property damage from flooding and erosion related to increased development. These facilities are in response to building regualtions which specify that runoff levels can not exceed those prior to construction. Such facilities include detention basins, ponds, and recharge basins, which can produce nuisance problems such as breeding mosquitoes and stagnant water. Designs for ponds or basins should incorporate components which provide for flow-through of fresh water, surface feeding fish, and a minimum water depth and slope. Outlet structures should be kept free of debris, be accessible for maintenance, and include an emergency spillway. (Titus-FRC)

4C. Effects On Water Of Man's Non-Water Activities

DEFORESTATION AND INCREASED FLOODING OF THE UPPER AMAZON,
Missouri Botanical Garden, St. Louis.
A. H. Gentry, and J. Lopez-Parodi.
Science, Vol 210, No 4476, p 1354-1356, December, 1980. 1 Fig, 2 Tab, 20 Ref.

Descriptors: *Amazon River, *Surface runoff, *Floods, *Runoff, Forest watersheds, Water level fluctuations, Tropical regions, Annual flood, Watersheds(Basins), Drainage, Rain forests, Water levels, Peru, Iquitos(Peru), River basins, *Lumbering, Effects, Land use, Rivers, High water mark, Water balance, Low water mark.

Flood crests of the upper Amazon River measured at Iquitos, Peru, averaged 27.1 meters during 1970-1978, a significant increase compared to the 25.0 meters measured during the previous decade. Low water levels (approximately 19.5 meters average) and rainfall did not vary appreciably during this period. In fact, during 1978, a drought year, the high water level exceeded that of any year prior to 1970. The greater amount of runoff is believed to be a result of increased deforestation in the upper parts of the Amazon watershed in Peru and Ecuador. This demonstrates the noticable, perhaps irreversible, changes in water balance resulting from relatively limited forest destruction. (Cassar-FRC)

ON-SITE DISCHARGE SOLVES STORMWATER PROBLEMS,
Russell and Axon, St. Louis, MO.
A. Karaca.
Public Works, Vol 111, No 3, p 54-55, March, 1980. 2 Fig.

Descriptors: *Urbanization, *Storm runoff, *Storm drains, Floods, Subsurface discharge, *Flood control, Urban drainage, Ditches, Percolation, Watersheds, Penetration, Permeability, Groundwater, Water table, Piezometry, Illinois, Storage capacity, Economic feasibility, *Centerville(IL).

Some of the conditions causing flooding in the Matheson Manor Housing Complex, Centerville, Illinois, and the measures taken to correct the problem are discussed. Paving of farmland for the complex decreased natural drainage surfaces and soil absorptive surface area of the watershed. Flooding occurred under normal rainstorms, and drainage ditches experienced ponding followed by stagnation. Costs for the installation of sewer lines, pumps and outfall structures were considered to be too high, so the St. Clair County Housing Authority agreed on the construction of an underground discharge ditch to allow percolation of the runoff water through granular rock medium to the natural groundwater table. A pervious soil layer and sufficiently deep groundwater levels were important for successful operation of the ditch. Investigations were made to determine the feasibility of the proposed system by examining water table levels over the past 100 years. Subsurface tests were conducted to determine the penetration capacity of the soil. It was concluded that a 10-foot wide, 4-foot, 6-inch deep and 275-foot long trench with an 18-inch wide and 5-foot, 6-inch deep second trench at the midpoint of the trench bottom would satisfy the design criteria. Piezometric and visual measurements are scheduled to gather empirical data on this new method of stormwater discharge. (Geiger-FRC)

4D. Watershed Protection

EMPIRICAL STUDIES OF SOIL CONSERVATION TECHNIQUES AND DESIGN PROCEDURES,
Purdue Univ., Lafayette, IN.; and Science and Education Administration, Lafayette, IN.
W. C. Moldenhauer, and G. R. Foster.
In: Proceedings, International Conference on Soil Conservation, National College of Agricultural Engineering, Silsoe, Bedford, England, July 21-25, 1980, p 13-29, (1981). 54 Ref. Wiley Interscience.

Descriptors: *Soil erosion, Research techniques, *Rainfall, *Runoff, *Soil conservation, Erosion control, Research facilities, Reviews, Technology.

The main body of knowledge on soil conservation techniques and design procedures is from empirical studies. Soil conservation research is generally aimed at a better understanding of soil erosion and its control. Since complexity reduces almost all erosion research to some level of empiricism, clear identification of empirical studies is not possible. For this discussion, empirical studies are ones where data can be collected from plots and small watersheds to directly measure the influence of a major factor or factors on erosion as it might occur in typical field situations. Analytical and modelling analyses define the current level of knowledge, or more precisely what is not known. They provide clues to the sensitive parameters, provide guides for design of experiments, and give hints to interactions that are useful during data interpretation. Models suggest equation forms for more applied and field design procedures. Similarly, basic research provides identification and fundamental understanding of important erosion processes. Modelling and basic research should not be ignored as being inapplicable in an applied research programme. Natural runoff plots, small watersheds, rainfall simulators, laboratory tests, field tests, models, statistics, calculus, computers, tabulation sheets, theoretical studies, empirical studies, basic studies, applied studies, etc., are research tools. A well equipped mechanic has all of these in his tool chest and selects the ones that are most appropriate for the given task.

INFLUENCE OF SURFACE ROUGHNESS AND CLOD SIZE AND STABILITY ON SOIL AND WATER LOSSES,
Purdue Univ., Lafayette, IN.; and Science and Education Administration, Lafayette, IN.
C. B. Johnson, J. V. Mannering, and W. C. Moldenhauer.
Soil Science Society of America Journal, Vol 43, No 4, p 772-777, 1979. 6 Fig, 7 Tab, 11 Ref.

Descriptors: *Water loss, *Infiltration, *Surface roughness, Clod size, Compaction, *Soil erosion, Soil tilling, Soil types, Particle size, *Erosion control, *Compacted soils.

Rough cloddy surfaces increased infiltration and decreased soil erosion compared to smoother surfaces as determined by simulated rainfall studies. Overtilling reduced surface roughness and clodddiness. One field experiment showed that a rough surface decreased runoff by 77% and soil erosion by 89% of that from a smooth surface. Tillage of wet soil increased surface roughness, but another field experiment showed that clods resulting from plowing the soil when wet were quite unstable compared with clods from plowing nearer the upper plastic limit. Tilling of compacted soil results in greater clodddiness than tilling of uncompacted soils. However, a laboratory experiment showed that compacted loam clods were less resistant to breakdown by water drop energy than those from uncompacted soil. Compaction of silty clay loam and silty clay soils did not change their stability significantly. To be effective as an erosion control measure, soil clods must be large enough and stable enough to keep infiltration at a high level until the crop canopy covers the soil surface. These studies describe the size and stability necessary to maintain a high level of runoff and erosion control.

Journal of Soil and Water Conservation, Vol 35, No 6, p 271-273, November/December, 1980. 3 Tab, 6 Ref.

Descriptors: *Watershed management, *Erosion control, *Agricultural watersheds, Linear programming, Soil management, Mathematical models, *Model studies, Cultivated lands, Land management, Conservation, Agronomy, Agriculture, Adoption of practices, Farm management, Small watersheds, Contour farming, Cover crops, Terracing, Little Nottoway(VA), Virginia.

A linear programming model, developed for a cooperative river basin study, was applied to the Little Nottoway watershed, Virginia. This approach provides individual farm plans and a list of crops and farming practices producing maximum net revenue and consistent with watershed conservation. For example, knowing soil type, acreage, and erosion limits, the model can tell a farmer how many acres of which crops to plant using optimum methods such as contour, terrace, winter cover crop, or combinations of these, for maximum profit. This model can also help planners assess alternative erosion control plans and identify critical areas needing assistance. (Cassar-FRC)

5A. Identification Of Pollutants

EVALUATION AND APPLICATION OF DIALYSIS TITRATION TECHNIQUE FOR DETERMINATION OF COMPLEXING CAPACITY OF FRESHWATERS,
New Hampshire Univ., Durham. Dept. of Chemistry.
J. H. Weber, and R. E. Truitt.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-161077, Price codes: A03 in paper copy, A01 in microfiche. Water Resources Research Center, University of New Hampshire Completion Report, Research Report 32, January 1981. 38 p, 4 Tab, 74 Ref. OWRT-B-004-NH(6), 14-34-0001-8132.

Descriptors: *Dialysis, *Volumetric analysis, Freshwater, Analytical techniques, *Trace elements, *Copper, *Cadmium, Cations, Membrane processes, Separation techniques, Diffusion, Membrane, Evaluation, Testing, Ions, Water quality, Estimating, Instrumentation, Laboratory tests, Research and development.

The report is divided into two sections. The first section covers an evaluation of dialysis titration as a method for determining the complexing capacity (metal ion binding ability) of 10 mg/liter soil-derived fulvic acid (SFA) solutions. The complexing capacities of SFA for Cu(II) or Cd(II) were measured at pH 5, 6 and 7 during dialysis experiments, and were found to be greater for Cu(II) than Cd(II) at the same pH, and increased for both cations as pH increased. A comparison of dialysis and Cu(II) selective electrode results showed no inter-technique difference in their ability to measure complexing capacity. In the second section, seven New Hampshire freshwater samples having naturally-occurring ligands were tested for Cu(II) and Cd(II) binding by dialysis titration. The results were termed potential binding levels (PBL), and were 1.1-15.1 micromolar for Cu(II) and 0.0-9.7 micromolar for Cd(II). Correlations of alkalinity, pH, dissolved organic carbon, hardness, conductance, and UV absorbance to Cu(II) and Cd(II) PBL values show significant correlation (p,0.90) of Cu(II) with inorganic but not organic sample properties, while Cd(II) PBL values had no significant trends. (Zielinski-IPA)

PICLORAM IN WATER AND SOIL FROM A SEMIARID PINYON-JUNIPER WATERSHED,
Science and Education Administration, Tucson, AZ.
T. N. Johnsen, Jr.
Journal of Environmental Quality, Vol 9, No 4, p 601-605, October/December, 1980. 4 Fig, 1 Tab, 19 Ref.

Descriptors: *Picloram, *Herbicides, *Pollutant identification, Water quality, Soil contamination, Semiarid climates, 2,4-D, Watersheds, *Path of pollutants.

Residues of picloram were measured in runoff water and soil from a semiarid pinyon-juniper rangeland area located in north-central Arizona. The area had been treated with applications of 2.8 kg acid equivalent (ae) of picloram and 5.6 kg ae 2,4-D as the triisopropanolamine salts in 94 liters of water/ha laid by helicopter over 13 ha. Runoff samples were collected from 10 different areas and assayed for picloram with an electron capture gas chromatograph method sensitive to 0.4 ppbw (parts per billion, by weight) picloram in water. Soil samples were collected from 3 locations at 1, 10, 22, 32, 44, 57, and 69 mo after application. Composite soil samples were taken from depths of 0-8, 8-15, 15-30, 30-45, 45-60, 60-90, and 90-122 cm at each location. Soils were assayed by use of soybean assays for biological activity. The first runoff water samples contained the highest picloram concentration, 320 ppbw. The last detection of picloram in a water sample was at a concentration of 1 ppbw 35.5 mo after application. Picloram was last detected in soils collected 44 mo after treatment. One month after application, 92% of the herbicide recovered was in the surface 8 cm of the soil. Nine months later 66% of the picloram found was in the 90-122 cm depth. Further study suggested that in time small amounts of picloram might move to the soil surface by capillary action and be exposed to direct sunlight and thus destroyed during each wetting-drying cycle of the soil. DETERMINATION OF PHOSPHORUS IN WASTE-WATERS BY INDUCTIVELY-COUPLED PLASMA ATOMIC EMISSION SPECTROMETRY,
Government Industrial Research Inst., Nagoya (Japan).
T. Ishizuka, K. Nakajima, and H. Sunahara.
Analytica Chimica Acta, Vol 121, p 197-203, December, 1980. 3 Fig, 4 Tab, 12 Ref.

Descriptors: *Waste water, *Phosphorus compounds, *Water analysis, Phosphorus, Phosphates, Spectrometry, Analytical techniques, *Pollutant identification.

Total phosphorus in waste waters was determined by inductively-coupled plasma-atomic emission spectrometry. The detection limits were 0.02, 0.04, and 0.11 micrograms per ml at the 213.618, 214.914, and 253.565 nanometer lines, respectively. Some interference was experienced with copper, but the following materials had negligible or small effect on the phosphorus determination at concentrations similar to those in waste water: Na, K, Ca, Mg, Cl, Al, Mn, Si, Ti, nitrate, sulfate, ammonium, dextrose and tartaric acid. Comparison of practical waste water samples analyzed by a standard method, the persulfate digestion-colorimetric method (molybdenum blue with ascorbic acid), and the method described in this paper showed good agreement between the methods. (Cassar-FRC)

AN EVALUATION OF DIFFERENTIAL PULSE ANODIC STRIPPING VOLTAMMETRY AT A ROTATING GLASSY CARBON ELECTRODE FOR THE DETERMINATION OF CADMIUM, COPPER, LEAD AND ZINC IN ANTARCTIC SNOW SAMPLES,
British Antarctic Survey, London (England).
M. P. Landy.
Analytica Chimica Acta, Vol 121, p 39-49, December, 1980. 1 Fig, 5 Tab, 25 Ref.

Descriptors: *Antarctica, *Metals, *Snow, *Path of pollutants, *Trace elements, Cadmium, Copper, Lead, Zinc, Analytical techniques, Water pollution sources, Adelaide Island, Polar regions.

Metals at sub ppb concentrations in Antarctic snow samples were determined without preconcentration by adapting differential pulse anodic stripping voltammetry at a rotating glassy electrode. In situ mercury plating gave better results than a permanent mercury film. Ultrapure water and rigorously cleaned vessels were essential. Low pH was maintained because under this condition the metals were more 'electrochemically available' and the rate of adsorption of metals onto the container was minimized. Samples of snow were collected on Adelaide Island to determine the relationship between metal concentration and source (a British base, the sea, and rock exposures). Zinc samples were taken, but container contamination caused results to be inconclusive. Levels of Cd, Cu, and Pb, averaged 0.37 + or - 0.30, less than 0.47 + or - 0.47, and 0.82 + or - 0.65 respectively on samples taken on a 30.9 km traverse north from the base. Samples 52 km from the base averaged about 0.10, suggesting anthropogenic origin. On a 14.4 km traverse from the sea, levels of Cd, Cu, and Pb (0.14 + or - 0.2, less than 0.08 + or - 0.11, and 0.20 + or - 0.24, respectively) approached the sample background level for remote areas. Metal content of snow samples taken near exposed rock indicated that local geology and wind direction and strength strongly affected metal distribution. (Cassar-FRC)

THE DETERMINATION OF ARSENIC BY ELECTROTHERMAL ATOMIC ABSORPTION SPECTROMETRY WITH A GRAPHITE FURNACE, PART 2. DETERMINATION OF ARSENIC(III) AND ARSENIC(V) AFTER EXTRACTION,
Antwerp Univ., Wilrijk (Belgium). Dept. of Chemistry.
D. Chakraborti, W. DeJonghe, and F. Adams.
Analytica Chimica Acta, Vol 120, p 121-127, November, 1980. 1 Fig, 3 Tab, 22 Ref.

Descriptors: *Arsenic compounds, *Analytical techniques, Pollutant identification, Water analysis, *Spectroscopy, Natural waters, Instrumentation.

Arsenite and arsenate can be sequentially determined in fresh and sea water samples by extraction and atomic absorption spectrometry. This method shows recoveries of greater than 90% and has a detection limit of 6 ng per liter. A 500 or 1000 ml sample is extracted with HCl and ammonium butyl dithiophosphate-hexane solution. Arsenic(3+) is then present in the organic layer; arsenic(5+), in the aqueous layer. After treatment of the aqueous layer with a reducing agent, sodium hydrogen sulfite-sodium thiosulfate solution, the previous extraction procedure is used and the now-reduced arsenic(5+) obtained in the organic layer. The latter is extracted with bromine water and reacted with nitric acid, hydrogen peroxide, and nickel sulfate solution. Samples are compared with stand-

ards using graphite furnace atomic absorption spectrometry. Interference from K, Al, Na, SO4, and other cations and anions is eliminated using this extraction reagent. (Cassar-FRC)

CHEMICAL SPECIATION OF MERCURY IN NATURAL WATERS,
National Water Research Inst., Burlington (Ontario).
P. D. Goulden, and D. H. J. Anthony.
Analytica Chimica Acta, Vol 120, p 129-139, November, 1980. 4 Fig, 3 Tab, 9 Ref.

Descriptors: *Mercury, *Water analysis, Analytical techniques, *Pollutant identification, Chemical properties, Path of pollutants, *Speciation, Ecosystems.

Speciation of mercury forms in environmental samples is of interest in order to determine the routes by which mercury passes through the ecosystem and because of the differing toxicities of the varying forms. Three species of mercury (inorganic, aryl mercury compounds, and alkyl mercury compounds) can be differentiated and determined in natural waters by improving the sensitivity of the cold vapor atomic absorption method. The detection limit has been lowered from 0.001 micrograms per liter to 1 nanogram per liter by partitioning at 90C and measuring absorbance at room temperature. Total mercury is determined in the mechanized system by digesting the sample, first to inorganic mercury, then to elemental mercury, which is measured by absorbance. Speciation is accomplished by treating with reducing agents; EDTA-water with hydroxylamine in alkaline solution reduces inorganic compounds to mercury; and CdCl2 and SnCl2 reduces all forms to mercury. (Cassar-FRC)

GAS CHROMATOGRAPHIC METHOD FOR THE DETERMINATION OF SELENITE AND TOTAL SELENIUM IN SEA WATER,
Southampton Univ. (England). Dept. of Oceanography.
C. I. Measures, and J. D. Burton.
Analytica Chimica Acta, Vol 120, p 177-186, November, 1980. 3 Fig, 6 Tab, 21 Ref.

Descriptors: *Selenium, *Sea water, *Pollutant identification, Analytical techniques, Water analysis, *Gas chromatography, Chemical properties

A method for routine determination of selenite and total selenium in sea water uses oxidation under controlled pH, extraction with toluene, and gas chromatography with an electron capture detector. Selenite reacts with 4-nitro-o-phenylenediamine at pH less than 1.8 to form 5-nitropiazselenol. A single toluene extraction yielded 80% recovery. Therefore, standards are prepared from known selenium solutions. Total selenium is determined by photo-oxidation of the sample, which has been mixed with borax and hydrogen peroxide. After this step, the selenite oxidation procedure converts the remainder of the selenium to the piazselenol. None of the ions studied (nitrate, nitrite, phosphate, silica, V(5+), Cr(3+), Cr(6+), Mn(2+), or Mn(4+)) interfered at concentrations 10 to 100 times normal sea water levels. Detection limit for this method is 10 pmol per liter. (Cassar-FRC)

AUTOMATIC DETERMINATION OF INORGANIC CARBON IN SURFACE WATERS,
Ontario Ministry of the Environment, Rexdale.
J. Crowther, and W. B. Moody.
Analytical Chimica Acta, Vol 120, p 305-311, November, 1980. 2 Fig, 2 Tab, 5 Ref.

Descriptors: *Carbon dioxide, *Acidic water, *Pollutant identification, Analytical techniques, Carbon, *Inorganic carbon, Acidity, Surface waters, Chemistry of precipitation, Water sources, Colorimetry.

An automated colorimetric procedure was developed for determination of dissolved inorganic carbon equilibria products in waters. This method, useful in studies of acid rains and waters, can handle concentrations in high and low ranges, 0.3-40.0 mg per liter and 0.01 to 2.00 mg per liter. For the high analytical range the sample was acidified to convert products to carbon dioxide. Then the stream was mixed with CO2-free air, passed over a gas dialyzer with a CO2-permeable membrane. Carbon was determined by measuring the loss in absorbance in a weakly buffered alkaline phenolphthalein solution at 550 nm. For the low range of concentration, an extra gas dialyzer and heating bath set at 60C were added and flow rates changed. Results are valid if samples are protected from the atmosphere. Interferences were limited to sulfide, which was detected as inorganic carbon. Eight common cations and 7 common anions, humic acid, and tannic acid did not interfere. (Cassar-FRC)

DETERMINATION OF TRACES OF PHENOL IN WATERS BY MOLECULAR EMISSION CAVITY ANALYSIS,
Ibadan Univ. (Nigeria). Dept. of Chemistry.
O. Osibanjo, and S. O. Ajayi.
Analytica Chimica Acta, Vol 120, p 371-375, November, 1980. 1 Fig, 3 Tab, 16 Ref.

Descriptors: *Phenols, *Analytical techniques, Aromatic compounds, *Pollutant identification, Water analysis, Molecular emission cavity analysis, Atomic absorption-emission spectroscopy.

Traces of phenol were determined in natural waters by adapting a flame atomic absorption/emission spectrophotmeter for molecular emission cavity analysis. The equipment was modified by assembling an indium-coated steel cavity. Water samples were treated with acetic acid and liquid bromine to form the tribromo derivative. This precipitate was dissolved in ethanol, injected into the cavity, and the InBr emission obtained on igniting the flame measured at 376 nm. A graph was prepared for phenol over the range 0.000005 to 0.00015 moles. Although the low levels of chloride, iodide, nitrate, sulfate, and phosphate ions found in surface waters do not interfere with the determination, high levels of phosphate, chloride, and iodide should be previously removed with silver sulfate. Nitrate can be reduced to nitrite and removed with sulfamic acid. Recoveries of 98% phenol were obtained using this method to analyze lake waters. (Cassar-FRC)

MOLECULAR EMISSION CAVITY ANALYSIS, PART 18. DETERMINATION OF SOLUBLE SULPHATE IN WATERS, SOIL, DUSTS, AND OTHER SAMPLES,
Birmingham Univ. (England). Dept. of Chemistry.
T. S. Al-Ghabsha, S. L. Bogdanski, and A. Townshend.
Analytica Chimica Acta, Vol 120, p 383-387, November, 1980. 3 Tab, 11 Ref.

Descriptors: *Sulfates, *Water analysis, *Soil analysis, Sulfur compounds, Analytical techniques, *Pollutant identification, Molecular emission cavity analysis, Atomic absorption-emission spectroscopy.

Water-soluble sulfates in samples of water, soil, and dusts were determined by a simple, quick, accurate method which does not involve precipitation. After digestion of the sample in water, the particulates were filtered out and the water concentrated by boiling. After addition of phosphoric acid, the solution was injected into a cold stainless steel cavity for measurement by molecular emission cavity analysis. Emission intensity at 384 nm was recorded as a function of time. Comparison with nephelometric and gravimetric methods showed good agreement. (Cassar-FRC)
W81-01619

DETERMINATION OF CYANIDE IN THE PRESENCE OF MERCAPTANS WITH A SELECTIVE-ELECTRODE,
Pardo de la Magdelena, Valladolid (Spain). Dept. of Analytical Chemistry.
J. L. Bernal, R. Pardo, and J. M. Rodriguez.
Analytica Chimica Acta, Vol 120, p 367-370, November, 1980. 2 Tab, 10 Ref.

Descriptors: *Cyanide, *Sulfur compounds, *Mercaptans, Water analysis, Analytical techniques, Waste water, Industrial wastes, *Pollutant identification, Electrometry, Ion-selective electrodes.

Interference of mercaptans in determination of cyanide in waste waters by the cyanide-selective electrode is eliminated by oxidation or oxidation-distillation treatments. The oxidation method, which detects only free cyanide, uses TISAB solution and hydrogen peroxide prior to electrode determination of cyanide ion. The oxidation-distillation method, which breaks down complexes and detects total cyanide ion, follows the oxidation treatment with addition of mercuric chloride, magnesium chloride, and sulfuric acid and distillation of hydrogen cyanide for a period of 50 minutes. Cyanide ion is determined with the electrode as before. (Cassar-FRC)
W81-01620

AN IMPROVED FLOW INJECTION DETERMINATION OF NITRITE IN WATERS BY USING INTERMITTENT FLOWS,
Centro de Energia Nuclear na Agricultura, Sao Paulo (Brazil).
E. A. G. Zagatto, A. O. Jacintho, J. Mortatti, and H. Bergamin.
Analytica Chimica Acta, Vol 120, p 399-403, November, 1980. 3 Fig, 1 Tab, 9 Ref.

Descriptors: *Nitrites, *Waste water, *Water analysis, Nitrogen compounds, Analytical techniques, *Pollutant identification, Instrumentation, Flow injection analysis, Spectroscopy.

A routine spectrophotometric method for determination of nitrites in waste waters uses an injector-commutator with a 0:1:2 section, which achieves intermittent flows without intermittent pumping. The merging zones approach is used to reduce consumption of reagents. With this method, 70 samples can be run hourly compared with 55 samples per hour without intermittent flow. Precision is 0.5% relative to a 60 ppb nitrite water sample. (Cassar-FRC)

A SIMPLE AND RAPID METHOD OF COLLECTING RADIONUCLIDES FROM RAIN WATER,
Chemical Analysis Center, Chiba (Japan).
T. Kimura, and T. Hamada.
Analytica Chimica Acta, Vol 120, p 419-422, November, 1980. 1 Fig, 2 Tab, 4 Ref.

Descriptors: *Rain water, *Strontium radioisotopes, Radionuclides, Water analysis, Fallout, *Radioisotopes, Nuclear explosions, Ion exchange resins, Sampling, Gamma rays, Pollution.

Radionuclides in rain water were concentrated by passing 10-liter samples through ion exchange resin columns. One method involved filtering the rain water sample, passing the filtrate through the resin column, evaporating the effluent to about 15 ml, and determining the gamma-emitters in filter, resin, and effluent by X-ray spectrometry. A second method used Powdex ion exchange resin treated with precoating material. Strontium solution was added to the sample as a carrier. After elution, radiostrontium was measured with a beta-ray spectrometer and total strontium by atomic absorption spectrometry. In Method 1, Zr95, Ce141, and Ce144 were collected on the filter paper; Be7 and Cs137 on the resin. A little Zr95, Ba140, and Ce144 were found in the effluent. In Method 2 almost all the gamma-emitters were found in the resin, little in the effluent. Recovery of strontium ions from the resin ranged between 75-90%. (Cassar-FRC)

QUANTITATIVE DETERMINATION OF MIREX AND ITS DEGRADATION PRODUCTS BY HIGH-RESOLUTION CAPILLARY GAS

Group 5A—Identification Of Pollutants

CHROMATOGRAPHY/MASS SPECTROMETRY,
Canada Centre for Inland Waters, Burlington (Ontario).
F. I. Onuska, M. E. Comba, and J. A. Coburn.
Analytical Chemistry, Vol 52, No 14, p 2272-2275, December, 1980. 3 Fig, 4 Tab, 10 Ref.

Descriptors: *Mirex, *Analytical techniques, *Pollutant identification, *Pesticide residues, Fish, Trout, Aquatic animals, Lampreys, Gas chromatography, Mass spectrometry, Lake Ontario, Niagara River.

Mirex and its environmental degradation products in samples of fish and suspended sediments from Lake Ontario and the Niagara River were determined by mass spectrometry using their electron impact ionization mass spectra. These results were compared with analysis by electron capture gas chromatography. Single ion monitoring for the selected ions m/z 546 and m/z 272 and multiple ion detection using four preselected ions showed insignificant statistical differences when compared with each other and the gas chromatography method. The single ion detection procedure monitoring ion m/z 272 was suggested as a rapid, sensitive method for determination of mirex. Ten trout samples contained between 75 and 330 picograms per microliter. Five lamprey samples averaged 14-17 picograms per microliter; the two sediment samples, 268 and 755 picograms per liter. (Cassar-FRC)
W81-01623

DETERMINATION OF TRACE ELEMENTS IN SEA WATER BY INDUCTIVELY-COUPLED PLASMA EMISSION SPECTROMETRY,
Takaishi City Environmental Pollution Control Center, Osaka (Japan).
A. Sugimae.
Analytica Chimica Acta, Vol 121, p 331-336, December, 1980. 3 Tab, 16 Ref.

Descriptors: *Trace elements, *Sea water, *Water analysis, Metals, *Pollutant identification, Analytical techniques, Lead, Manganese, Cadmium, Nickel, Zinc, Iron, Vanadium, Copper, *Spectrophotometry, Atomic absorption-emission.

Inductively-coupled plasma emission spectrometry has been applied to detection of trace elements in sea water without interference from the high levels of Na, Mg, and Ca present. Complexes of the trace metals (Pb, Zn, Cd, Ni, Mn, Fe, V, and Cu) with sodium diethyldithiocarbamate are extracted with chloroform. Before nebulization, the extract is evaporated to dryness, treated with hydrochloric acid and nitric acid, evaporated again, and dissolved in distilled water. Recoveries of trace elements examined were 97-99%, with the exception of V (83 + or - 5%). Detection limits for one-liter samples in micrograms per liter are as follows: Mn, 0.063; Zn, 0.13; Cd, 0.25; Fe, 0.25; V, 0.38; Ni, 0.5; Cu, 0.5; and Pb, 2.5. (Cassar-FRC)

PURGE VESSEL DESIGN IN DETERMINATIONS OF VOLATILE ORGANIC COMPOUNDS,
Dow Chemical Co., Midland, MI.
T. Ramstad, and T. J. Nestrick.
Analytica Chimica Acta, Vol 121, p 345-348, December, 1980. 1 Fig, 3 Ref.

Descriptors: *Organic compounds, *Water analysis, *Purge vessels, Volatile organics, Instrumentation, Waste water, *Pollutant identification, Volatility.

Five purge vessels for determination of volatile organic compounds in aqueous systems are described and illustrated. The Bellar and Lichtenberg (B and L) vessel is waterjacketed and fitted with an antifoam device. Sample capacity is 10 cu cm. Detection limits are sub ppb. The Mini B and L is useful where sample size is limited, where shortened purge time is important, and in analysis of industrial waste streams. The Mini B and L with foam trap is useful for samples 1.5 cu cm or less which foam. The packed purge vessel completely suppresses servere foaming and supplies high purging efficiency. The particulate purge vessel can determine volatile organics in sediments, soils, and sludges. (Cassar-FRC)
W81-01625

THE D.C. POLAROGRAPHIC DETERMINATION OF TRACES OF HUMIC SUBSTANCES IN POTABLE WATERS (SPURENANALYSE VON HUMINSTOFFEN IM TRINKWASSER),
Academie der Wissenschaften der DDR, Leipzig. Forschungsstelle fuer Chemische Toxikologie.
H. Sohr, and K. Wienhold.
Analytica Chimica Acta, Vol 121, p 309-314, December, 1980. 3 Fig, 9 Ref. (English summary).

Descriptors: *Humic acids, *Potable water, *Fulvic acids, Organic acids, Analytical techniques, Water analysis, *Pollutant identification, Polarography.

Humic substances reduce the inhibitory effect of a tri-n-butylphosphate layer absorbed at the mercury drop on the polarographic wave of copper (II). This effect can be used to measure humic substances in drinking water in the range 0.05 to 1 mg per liter. This method does not differentiate between humic and fulvic acids. Amino acids, peptides, and polyhydroxy compounds do not interfere. A reference compound isolated from peat bog water was used. (Cassar-FRC)

SAMPLING OF WATER AND WASTE WATER: PRACTICAL ASPECTS OF SAMPLE COLLECTION,
Severn-trent Water Authority (England). Avon Div.
T. Schofield.
Water Pollution Control, Vol 79, No 4, p 468-476, November, 1980. 1 Tab, 4 Ref, Append.

Descriptors: Sampling, *Water sampling, *Water pollution, *Water quality, Data collections, Monitoring, Measurement, Equipment, Waste water(Pollution), Streamflow, Flow rates, *Water analysis, Methodology.

Practical suggestions for reliable collection of water and waste water samples are discussed. A thorough understanding of the system and sites (continuous vs. batch, two-phase liquids, changes in river flow, etc.) is necessary for effective sample collection. The nature of discrete and composite samples is described. Composite samples may include time-interval, flow-proportional, sequential, and continuous. Proper sample size, handling, labeling, and preservation of stability are emphasized. Automatic sampling methods are briefly discussed. Properties and advantages of commercial instruments available for automatic sampling are compared in a table. (Cassar-FRC)

5B. Sources Of Pollution

INVESTIGATION INTO EFFLUENT DISCHARGES FROM WASHINGTON FRESH APPLE PACKERS, VOLUMES I AND II,
SCS Engineers, Long Beach, CA.
J. Vuceta, R. Marsh, K. LaConde, and T. Dong.
Report, September 17, 1980. Vol 1 - 110 p, Vol 2 - 82 p, 23 Fig, 16 Tab, 153 Ref, 4 Append. EPA 68-03-2578.

Descriptors: *Washington, *Pre-treatment(Water), *Water sampling, *Adsorption, *Apples, Orchards, Laboratory tests, Chemical degradation, Chemical properties, Biomass, Activated sludge, Filtration, Groundwater, Apple packing industry, Effluents, Storage, Preservation, Chemicals.

Disposal practices and pretreatment technology were investigated for four chemicals---diphenylamine (DPA), sodium orthophenylphenate (SOPP), benomyl, and thiabendazole (TBZ)---utilized by Washington State fresh apple packers. Samples of effluent streams, in-process batch solutions, and groundwater were analyzed. A laboratory-scale activated sludge (AS) unit was used to evaluate each chemical. Carbon adsorption, coagulation, filtration, ion exchange, and chemical pretreatment technologies were evaluated. Theoretical degradation products of all four chemicals were assessed. DPA upset the AS unit under slug load conditions at 100 ppm. None of the other chemicals exhibited toxic effects. Activated carbon adsorption appeared to be the most effective pretreatment technology in terms of removal efficiencies; mixed-media filtration, the least effective. Very little published information was found relative to degradation products of DPA and SOPP, while the published information on benomyl and TBZ was found to be more extensive. The possible degradation pathways of each were thus developed, based also on their similarity with other applicable organics. It was concluded that the catabolic and metabolic pathways of all four chemicals are not well understood. Volume II, the appendices, contains detailed descriptions of the analytical techniques used during this study. (Author's abstract)

IMPACT OF URBAN STORM RUNOFF ON STREAM QUALITY NEAR ATLANTA, GEORGIA,
Geological Survey, Doraville, GA. Water Resources Div.
J. B. McConnell.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-142473, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-094, August 1980. 64 p, 11 Fig, 15 Tab, 13 Ref. EPA-IAG-D6-0137.

Descriptors: *Urban runoff, *Storm water, *Streams, *Water quality, Storm runoff, Thunderstorms, Dry seasons, Water pollution, Georgia, Summer, Autumn, Coliforms, Biochemical oxygen demand, Dissolved oxygen, Trace elements, Waste treatment, Low flow, Reservoir releases, Atlanta area(GA).

The objective of this study was to assess the impact of stormwater runoff from point and nonpoint sources on the water quality of receiving streams in the Atlanta area. Emphasis was placed on the collection of water-quality data in the summer and autumn to determine the impact on streams from runoff produced by thunderstorms during the dry-weather seasons. Compared to dry-weather flow, stormwater runoff significantly increased the average concentration of suspended sediment, BOD 5, total organic carbon, total ammonia nitrogen, total phosphorus, fecal coliform bacteria, and trace metals in most receiving streams in the Atlanta Metropolitan Area. Stormwater runoff increased the mean concentration of most constituents 2- to 5-fold. In most streams, the dissolved-oxygen concentrations generally increased to near saturation during periods of stormwater runoff. The dissolved-oxygen concentration in the Chattahoochee River near Fairburn during a period of low flow reached a low of 1.5 milligrams per liter (a 4-milligram per liter decrease) as a result of runoff from a July thunderstorm. However, low flow during the summer and autumn occurs only about 21% of the time due to flow regulation of the river. The flushing and dilution effect of water released for power generation caused a significant improvement in Chattahoochee River quality most of the time. (Author's abstract)

Descriptors: *Viruses, *Adsorption, *Waste water treatment, *Physicochemical properties, Aluminum, Chemical properties, Theoretical analysis, Chemical degradation, Disinfection, Environmental sanitation, Water treatment, Public health.

Using poliovirus type 1 as a model enterovirus, it was established with a wide range of materials that adsorption is controlled by the balance between electrostatic double layer interactions and electrodynamic Van der Waals interactions. This control was demonstrated by showing that adsorption free energies calculated from mass action arguments are in good agreement with adsorption potentials calculated from the DLVO-Lifshitz theory of colloid stability. Since this enterovirus is quite characteristic of enteroviruses in size, geometry, electrokinetic properties, and survival in the environment, these studies should be representative of enteroviruses in general. Some solids, most notably aluminum metal, degrade virus during adsorption. When information gained in mechanism and degradation studies was applied to a bench scale system with a 1 cm bed of aluminum and 0.7 min residence time, it was found that aluminum metal removes more than 99% of the input virus titer from secondary effluent at steady-state. Aluminum metal is substantially more effective than granular activated carbon for the purpose of virus removal, and has good potential for eventual use in advanced water and waste water treatment systems. The DLVO-Lifshitz theory provides a fundamental, organized frame of reference in which to understand virus adsorption, and allows prediction of the types of materials and solution conditions conducive to virus adsorption and those that are not. AN EVALUATION OF NONPOINT SOURCES OF PESTICIDE POLLUTION IN RUNOFF,
North Carolina State Univ. at Raleigh. Dept. of Crop Science.
J. B. Weber, P. J. Shea, and H. J. Strek.
In: Environmental Impact of Nonpoint Source Pollution, 1980, p 69-98. 4 Tab, 51 Ref. Ann Arbor Science Publishers Inc., Ann Arbor, Michigan. OWRT-B-122-NC(4).

Descriptors: *Agricultural runoff, *Rainfall-runoff relationships, *Pesticide drift, Research priorities, *Agricultural chemicals, Rainfall intensity, Runoff, Agriculture, Surface runoff, Surface waters, Pesticides, Planning, Evaluation, Chemicals, Chlorinated hydrocarbon pesticides, Pesticide removal, Poisons, Toxins, Rain, Hazards, Deposition(Pesticides), Residues, Research and development, *Path of pollutants.

The amount of field-applied pesticide runoff into streams depends primarily upon the intensity and duration of rainfall, and the length of time between pesticide application and rainfall occurrence. The objectives of this study were to (1) evaluate the amounts and hazards of pesticides in runoff from agricultural lands, and (2) discuss and evaluate the types of research being carried out to measure this phenomenon. In spite of efforts to measure, model, and modify pesticide runoff from agricultural lands, few new practical developments have resulted since the inception of soil conservation practices recommended over 40 years ago. Pesticide losses to agricultural runoff in long-term studies average 1-2%; while losses under the most 'castastrophic' rainfall condtions averaged about 7% - values comparable to fertilizer nutrient losses in runoff. Hence, sound soil management and conservation practices are applicable for controlling pesticide runoff. Nonetheless, owing to the increased disposal of municipal sludges on agricultrual lands, the use of models to study/predict toxic sludge chemical runoff is encouraged. (Zielinski-IPA)

FATE OF POLYCHLORINATED BIPHENYLS (PCBS) IN SOIL-PLANT SYSTEMS,
North Carolina State Univ. at Raleigh. Dept. of Biological and Agricultural Engineering.
D. Pal, J. B. Weber, and M. R. Overcash.
Residue Reviews, Vol 74, p 45-98, 1980, 20 Fig, 14 Tab, 79 Ref. OWRT-B-122-NC(3).

Descriptors: *Polychlorinated biphenyls, *Soil-water-plant relationships, *Pesticide residues, *Path of pollutants, *Chemical degradation, Chemical analysis, PCB, Aroclors, Chlorinated hydrocarbon pesticides, Pollutant indentification, Pollutants, Soil chemistry, Soil contamination, Soil science, Environment, Environmental control, Soil dynamics, Plant physiology, Hazards, Deposition(Pesticides), Residues, Research and development, Kinetics, Public Health.

This review has evaluated the decomposition and stability of PCBs in soil-plant environments. Assessment was made of the phenomena of plant uptake and accumulation of PCBs, under various growth conditions, and their metabolites in the different parts of plants. Specifically highlighted were the problems of agronomic implications and practices in a society where waste PCBs may be managed by land application at assimilative rates that are safe and economically acceptable. Factors influencing the behavior and fate of PCBs in soils and in crops of agronomic importance have been developed, and a conceptual flow diagram is presented. PCBs decompose in soil system, probably faster than in any other waste management alternative or receiver system involving biological activity. Four areas for future research were identified based on observed major drawbacks in existing data: (1) study of properties of individual PCBs instead of commercial preparations; (2) crop/soil studies with PCBs having four or more chlorine atoms; (3) need for partition coefficient data (soil-water; water-air; air-plant; during flow in the food chain); (4) need for reliable data (e.g., volatization, photodecomposition and water-related transport). A SURVEY OF PATHOGEN SURVIVAL DURING MUNICIPAL SOLID WASTE AND MANURE TREATMENT PROCESSES,
Ebon Research Systems, Washington, DC.
S. A. Ware.
Environmental Protection Agency Report EPA-600/8-80-034, August, 1980. 115 p, 13 Fig, 26 Tab, 121 Ref. 2 Append. 68-03-2460-5.

Descriptors: *Municipal wastes, *Farm wastes, *Waste treatment, Pathogenic fungi, *Pathogenic bacteria, Animal parasites, Viruses, Water pollution sources, Microorganisms, Public Health, Solid wastes, Environmental sanitation, Incineration, Landfills, Anaerobic digestion, Composting.

Municipal solid waste (MSW) and animal manure may contain microorganisms that cause disease in man and animals. These pathogenic microorganisms include enteric bacteria, fungi, viruses, and human and animal parasites. Composting appears to be an effective method of destroying pathogenic organisms provided that sufficient times and temperatures are achieved. The extent to which microorganisms are destroyed during incineration is a function of both the design and the manner of operation of the incinerator. All pathogens should be destroyed provided that the entire solid waste charge quickly reaches an appropriate temperature. There is a possibility that pathogenic bacteria and viruses may survive conditions within sanitary landfills, and may be leached to ground or surface water. There appears to be a significant decrease in viral and bacterial content of leachate with time of operation or leaching of the fill. The chemical and physical characteristics of the leachate also contribute toward both viral and bacterial inactivation. No studies were available on pathogen survival in anaerobically digested MSW, but studies of digested sewage sludge have shown survival of pathogenic organisms. It appears that prolonged survival of some of the more common pathogens present in animal wastes is possible within the oxidation ditch environment. High gradient magnetic separation and gama radiation sterilization are future options, especially for animal waste management. (Moore-SRC)

Descriptors: *Water quality, *Air pollution, *Powerplants, Smoke, *Snowmelt, Streams, *Coal, Montana, Arsenic, Mercury, Coal mines, Runoff, Heavy metals, Water pollution, Sediments, Chemical precipitation, Alkaline water, *Rosebud Creek(MT).

Rosebud Creek is the major surface drainage immediately east of the powerplant at Colstrip, Montana. This study was begun in October of 1975, about two months before initiation of power generation at this site, and continued through the spring of 1978. Although coal mining and power generation occur at Colstrip, the effects of mining on water quality have not been detected in creeks having headwaters in the mine area. Influxes of arsenic, mercury, and polynuclear aromatic compounds occurring during snowmelt periods have been linked to scavenging of those contaminants from the plume of the power plant. Snow cover tends to accumulate plume constituents, therby semi-isolating them from the soil and terrestrial biota so that both are denied the extent of contaminant accumulation operative during warmer months. Soluble contaminants accumulating throughout the watershed may consequently be delivered to the stream via the surface runoff associated with snowmelt. Influxes of contaminants delivered intermittently to surface streams via this general route are likely to accumulate in sediments due to normal sedimentation processes and the generally alkaline characteristics of streams in this region which will enhance precipitation of heavy metals. Examination of the Rosebud Creek water quality data for the period of this study indicates that the average concentrations of constituents are at levels considered safe for maintenance of aquatic life. COMMENT ON 'A NEW COLLOCATION METHOD FOR THE SOLUTION OF THE CONVECTION-DOMINATED TRANSPORT EQUATION' BY GEORGE E. PINDER AND ALLEN SHAPIRO,
Geological Survey, NSTL Station, MS. Water Resources Div.
H. E. Jobson.
Water Resources Research, Vol 16, No 6, p 1135-1136, December, 1980. 3 Fig, 2 Ref.

Descriptors: *Lagrange equation, *Eulerian equation, Dispersion, Equations, *Diffusion, Convection, Mixing, *Transport equation.

The author presents calculations supporting his opinion that the Lagrangian reference frame is superior to the Eulerian for obtaining numerical solutions to the 1-dimensional transport equation.

He claims that the Lagrangian solution is easy to understand, cheap to execute on a computer (1.28 seconds maximum time), stable, and offers a framework from which meaningful information about rate coefficients for transport of nonconservative substances can be estimated. (Cassar-FRC)

A WATERSHED STUDY OF GLYPHOSATE TRANSPORT IN RUNOFF,
Science and Education Administration, Coshocton, OH. North Appalachian Experimental Watershed.
W. M. Edwards, G. B. Triplett, Jr., and R. M. Kramer.
Journal of Environmental Quality, Vol 9, No 4, p 661-665, October/December, 1980. 5 Tab, 18 Ref.

Descriptors: *Runoff, *Agricultural runoff, *Herbicides, Rainfall-runoff relationships, Storm runoff, Surface runoff, Erosion, Water pollution control, Watersheds, On-site studies, *Path of pollutants.

The persistence of glyphosate in the soil and its presence in runoff water from field-sized watersheds where it had been used as an herbicide in the production of no-tillage corn and in the establishment of fescue pastures without tillage were evaluated. Each significant runoff event during the growing season was sampled. During the three year study the greatest transport of glyphosate in runoff from any watershed was 165 g/ha, or 1.85% of the amount applied. Most of that loss resulted from a single storm occurring 1 day after an abnormally high glyphosate treatment of 8.96 kg/ha had been applied. At all other sample testing times, the runoff was less than 1% of the glyphosate applied. Both the application rate and the time interval between application and cause for runoff influenced the amount of glyphosate in the runoff. Runoff occurring as a result of a long duration, low intensity storm taking place when the ground was already wet had a lower glyphosate concentration than would be otherwise expected. It was concluded that runoff from fields treated with Roundup herbicide (active ingredient, glyphosate) at recommended concentrations would not constitute an environmental hazard. (Baker-FRC)

THE EFFECT OF A MARSH ON RUNOFF: I. A WATER-BUDGET MODEL,
Oak Ridge National Lab., TN.
D. D. Huff, and H. L. Young.
Journal of Environmental Quality, Vol 9, No 4, p 633-640, October-December, 1980. 5 Fig, 4 Tab, 9 Ref.

Descriptors: *Nutrients, Evaporation, Transpiration, Phosphorus, *Hydrologic budget, Transport, *Model studies, Marsh management, *Marshes, Hydrologic data, Groundwater, Surface water, *Path of pollutants.

Field and simulation studies developed to investigate the transport of nutrients in surface and subsurface water flows across a marsh are discussed. Wingra marsh, which is adjacent to Lake Wingra in Madison, Wisconsin, was used for the studies. Monthly totals of evaporation-transpiration, surface runoff, and subsurface drainage were calculated from April 1970 through August 1976. Urban storm runoff accounts for about 90% of the water in the marsh, while 8% comes from precipitation and 2% from deep ground-water inflow. Surface outflow accounts for 85% of the water that leaves the marsh, while evaporation/transpiration accounts for 7% and shallow ground-water discharge for 8%. The water-budget model developed is able to reproduce water-table fluctuations and estimate the correct level within 10 cm during most of the time. In 1970 the model simulations were begun, and a comparison is offered which indicates that the accuracy of the method is adequate for estimating phosphorus inputs to the lake. (Baker-FRC)

THE OXIDATION OF ARSENITE BY AQUATIC SEDIMENTS,
Saskatchewan Univ., Saskatoon. Dept. of Soil Science.
D. W. Oscarson, P. M. Huang, and W. K. Liaw.
Journal of Environmental Quality, Vol 9, No 4, p 700-703, October/December, 1980. 1 Fig, 3 Tab, 33 Ref.

Descriptors: *Chemical reactions, *Sediments, *Arsenic compounds, Agricultural chemicals, Oxidation, Water quality, Sedimentation, Arsenicals, Pesticides, Lake sediments.

The role of freshwater sediments in the oxidation of As(III) to As(V) was studied. Sediments were taken from five lakes, Buffalo Pound, Pasqua, Echo, Mission, and Katepwa, in Saskatchewan, Canada. These lakes drain a large area of the agricultural land in southern Saskatchewan. Composite samples were used for all experiments. The concentration of As(III) and the ratio of As(III) to As(III) + As(V) in solution indicates that all five lake sediments oxidize As(III) within 48 hr. In the absence of sediment, oxidation of As(III) is not detectable within 72 hr. Sorption of As occurred simultaneously with the oxidation of As(III) to As(V). Over 90% of added As was sorbed by sediments within 72 hr, except in the Buffalo Pound sediment. Flushing of nitrogen or air through the sediment suspensions did not influence the oxidation of As(III). Neither was the oxidation influenced by HgCl2. The oxidation is an abiotic process, with microorganisms occupying only a minor role. (Baker-FRC)

MAXIMUM PESTICIDE CONCENTRATIONS IN AGRICULTURAL RUNOFF: A SEMIEMPIRICAL PREDICTION FORMULA,
Southern Weed Science Lab., Stoneville, MS.
R. D. Wauchope, and R. A. Leonard.
Journal of Environmental Quality, Vol 9, No 4, p 665-672, October/December, 1980. 4 Fig, 2 Tab, 36 Ref.

Descriptors: *Model studies, *Agricultural runoff, *Pesticides, Herbicides, Runoff, Agricultural chemicals, Water quality control, Rainfall-runoff relationships.

A simple semiempirical model is described that predicts single event, edge-of-field bulk runoff concentrations of pesticides in terms of factors such as the physical-chemical properties of the compound, the location of the spray deposit after application, the amount of chemical applied on an area basis, and the dissipation and degradation of spray deposits before runoff occurs. The formula which was constructed is based on data culled from the literature concerning concentrations of pesticides observed in runoff waters. While the formula is crude, it should be useful to water quality planners in their attempts to predict worst-case pesticide inputs from agricultural sources. (Baker-FRC)

EFFECT OF SEWAGE EFFLUENT ON MICROBIAL ACTIVITIES AND COLIFORM POPULATIONS OF PAHOKEE MUCK,
Florida Univ., Belle Glade.
R. L. Tate, III, and R. E. Terry.
Journal of Environmental Quality, Vol 9, No 4, p 673-677, October/December, 1980. 2 Fig, 4 Tab, 19 Ref.

Descriptors: *Sewage effluent, *Organic matter, Muck soils, Microbial degradation, Coliforms, Sewage treatment, *Sewage disposal, Land subsidence, Soil disposal fields.

The effect of sewage effluent was measured on microbial activity in Pahokee muck. Test plots were amended at weekly intervals with sewage effluent at a rate of 5 cm/wk. In general, the indigenous microbial activity of the effluent-amended soil was greater than that of the soil which was water-amended or untreated. An increase in indigenous activity occurred with the addition of the sewage effluent to the soil, and then declined steadily throughout the week between sewage additions. The increase in activity immediately after amendment reflected the biochemical oxygen demand of the effluent. Anaerobic bacterial populations did not differ significantly between the sewage-effluent or water-amended samples or unamended soil plots. However, significant variations were noted for various sample dates, most likely resulting from soil moisture changes. The augmented dehydrogenase activities and generally elevated carbon metabolic rates in amended soils indicate that microbial activity in the muck was stimulated. Coliform bacteria passed through the soil profile, but the increased moisture, not the nutrients, of the sewage effluent stimulated the oxidation of soil organic matter, thereby stimulating soil subsidence. Therefore a sewage disposal plan involving cultivated organic soils must be viewed as a threat to the longevity of the soils. (Baker-FRC)

EXTRACTION, SPECIATION, AND ANALYSIS OF ARSENIC AND ARSENICAL HERBICIDES IN RUNOFF: EVALUATION OF SIMPLE METHODS AT THE PPB LEVEL,
Southern Weed Science Lab., Stoneville, MS. Chemistry Dept.
R. D. Wauchope, and M. Yamamoto.
Journal of Environmental Quality, Vol 9, No 4, p 597-601, October/December, 1980. 3 Fig, 2 Tab, 12 Ref.

Descriptors: *Herbicides, *Arsenic, Arsenicals, Arsenic compounds, *Pollutant identification, Gas chromatography, Analytical techniques, Water analysis, Runoff, Path of pollutants.

One of the simplest available techniques of speciation and analysis, column chromatography, was applied to the study of arsenic in runoff mixtures of water and sediment. The method involved the following steps: collection of natural runoff samples, spiking of samples with inorganic arsenic (as arsenate) and DSMA at levels similar to those found in cotton-field runoff, separation of water and sediment, extraction and speciation of added and natural arsenic in sediment and water, and quantification of arsenic in the fractions. The separated arsenic species were quantitated at the ppb level by a flameless atomic absorption technique. The arsenate ion is present in the soils as a natural component. Methanearsonate ions are present in the soil due to the use of sodium (MSMA) and disodium (DSMA) salt forms as herbicides. By this method, recoveries ranged from 80-100%, with the relative precision between samples being 10% for concentrations of arsenic between 10 and 200 ppb. It appeared that the arsenate was much more strongly adsorbed by sediments than was methanearsonate. This technique should be useful in determining whether there are significant species changes when arsenate or methanearsonate enter surface impoundments and in studying sediment-water partitioning of the species. CONTROLLING THE RATE OF ACID LOSS FROM STRIP MINE SPOIL,
Science and Education Administration, University Park., PA. Northeast Watershed Research Center.
H. B. Pionke, A. S. Rogowski, and R. J. de Angelis.
Journal of Environmental Quality, Vol 9, No 4, p 694-699, October/December, 1980. 4 Fig, 2 Tab, 16 Ref.

Descriptors: *Acid streams, *Mine wastes, *Pyrite, Groundwater movement, Mine drainage, Soil

water movement, Acidic water, Water pollution sources, Leaching.

The worsening of groundwater quality especially due to acid products contamination from strip mine spoil is discussed. The experimental design consisted of incubating drained, wetted strip mine spoil in an air or nitrogen atmosphere for various periods of time. When incubation was terminated, the spoil was quickly leached and the leachate was chemically analyzed. The soil material that was used contained substantial concentrations of pyrite (3.8%) and acid products (3.1%). Initial acid losses to groundwater were large if materials were placed deeply, especially when the materials were submerged or frequent flushing occurred. As leaching progressed, diffusion became potentially the limiting factor. Pyrite oxidation in the spoil particle was primarily controlled by either the pyrite oxidation rate or the oxygen diffusion rate. Where oxygen is present in excess and the particle remains water saturated, the initial and subsequent rates of acid production from pyrite will be controlled by the pyrite oxidation rate. When the spoil is deeply submerged, oxygen diffusion is likely to be the limiting factor. The basic particle size is important in controlling rates of salt and acid losses to groundwaters in cases where diffusion is limiting, as this reduces the acid-contributing volumes relative to the total spoil mass. (Baker-FRC)

SOIL POTENTIAL RATINGS FOR SEPTIC TANK ABSORPTION FIELDS IN LEON COUNTY, FLORIDA,
Soil Conservation Service, Lanham, MD.
R. L. Guthrie, and G. J. Latshaw.
Journal of Soil and Water Conservation, Vol 35, No 6, p 278-280, November/December, 1980. 4 Tab, 2 Ref.

Descriptors: *Septic tanks, *Sewage disposal, *Soil disposal fields, Absorption fields, Soil potential index, Land use, Leon County, Florida, Domestic wastes, Percolation, Soil types, Soil properties, Waste disposal, Costs, Estimated costs.

Soil potential ratings were tested in Leon County, Florida, septic tank absorption fields according to the formula, SPI = P - (CM + CL) where SPI = soil potential index, P is index of performance of yield, CM is the index of cost of corrective measures, and CL is the index of costs resulting from continuing limitations. Soil scientists, sanitarians, and contractors worked on different aspects of the soil potential index components in order to calculate reliable figures. A table lists 47 local soils and their SPI. Although all ratings apply only to the local area, this pilot study provides several advantages. Residents have available better information on corrective measures, local regulations, uniformity of procedure, and costs involved. (Cassar-FRC)

BIOLOGICALLY MEDIATED CORROSION AND ITS EFFECTS ON WATER QUALITY IN DISTRIBUTION SYSTEMS,
Georgia Inst. of Tech., Atlanta. School of Civil Engineering.
S. H. Lee, J. T. O'Connor, and S. K. Banerji.
Journal of the American Water Works Association, Vol 72, No 11, Part 1, p 636-645, November, 1980. 11 Fig, 2 Tab, 42 Ref.

Descriptors: *Corrosion, *Microorganisms, *Pipes, Iron, Distribution systems, Water quality, Metals, Bacteria, Water pollution sources, Tubercles.

The corrosion process in pipes was studied in a four-loop pipe system: two polyvinyl chloride pipes with provisions to insert iron test specimens and two steel pipes. Tap water was circulated throughout the system. Within two days 86% of the dissolved oxygen concentration had been depleted in the steel pipe system, 20% in the PVC pipe. Alkalinity and total hardness, which decreased initially in both systems, continued to decrease in the steel pipes. Sulfate ion, pH, ammonium ion, phosphate, and total organic carbon concentrations changed little or were detected in small amounts. Bacteria identified in all systems were iron-precipitating, sulfate-reducing, denitrifying, and stalk-producing organisms. Corrosion rate was highest initially, decreasing to a steady rate. Examination of corroded material showed the presence of the same bacteria seen in the water. Batch corrosion studies were performed using microorganisms isolated from the water. These grew better as a mixed population than as isolated strains. Since weight loss of test specimens was not appreciable, it is believed that microbes promote a localized corrosion of iron through tubercle formation. (Cassar-FRC)

THE OCCURRENCE OF MICROORGANISMS IN WATER MAIN ENCRUSTATIONS,
Environmental Protection Agency, Dallas, TX. Air and Hazardous Materials Div.
M. J. Allen, R. H. Taylor, and E. E. Geldreich.
Journal of the American Water Works Association, Vol 72, No 11, Part 1, p 614-625, November, 1980. 26 Fig, 1 Tab, 13 Ref.

Descriptors: *Microorganisms, *Distribution systems, *Pipes, Corrosion control, Water distribution(Applied), Bacteria, Tubercles, Water pollution sources.

Microorganisms from encrustations or tubercles inside distribution systems were examined by scanning electron microscope. Samples from several locations throughout the U.S. possessed some common characteristics. A multitude of crystal arrays were found beneath a hard, porous surface. Microorganisms were seen at or near the surface of the tubercles, where nutrients and oxygen are continually present. Diatoms and algae were present in pipes from areas which do not use filtration for treatment of surface waters. Actinomycete bacteria were identified in several specimens. By sequential magnification of a porous specimen, organisms were found growing beneath the surface veneer. The presence of these microorganims in the distribution systems does not reflect inadequate treatment, but rather the adaptability of the microbes to their environment. The populations may be decreased by reducing the nutrient and particulate levels and by improving corrosion control. In severe cases, reconditioning or replacing old water mains and eliminating dead ends may be effective. (Cassar-FRC)

BACTERIAL, CHEMICAL, AND MINERALOGICAL CHARACTERISTICS OF TUBERCLES IN DISTRIBUTION PIPELINES,
Ohio State Univ., Columbus. Dept. of Microbiology.
O. H. Tuovinen, K. S. Button, A. Vuorinen, L. Carlson, and D. M. Mair.
Journal of the American Water Works Association, Vol, 72, No 11, Part 1, p 626-635, November, 1980. 5 Fig, 13 Tab, 35 Ref.

Descriptors: *Microorganisms, *Distribution systems, *Pipes, Corrosion control, Iron oxide, Metals, Bacteria, Pollutants, *Columbus(Ohio), Tubercles, Water pollution sources.

Tubercle deposits collected from pipelines in the Columbus, Ohio, water system were examined to characterize bacteria, chemical composition, and minerals present. The complex environment favors a variety of biological and chemical interactions. Many types of bacteria were present: sulfate reducers, nitrate oxidizers, ammonia oxidizers, sulfur oxidizers, and unidentified aerobic heterotrophic bacteria. Filamentous organisms, coliforms and iron oxidizers were not detected. Iron oxide was the major constituent of tubercles, with Ca, Mg, Al, and Mn present at high levels. All samples contained humic material of varying degrees of polymerization, mostly on the surface of the tubercle or in pits on the pipe surface. Corrosion studies showed that pitting, not uniform corrosion, was the predominant form. Tubercles generally had hard crusty exteriors, where chloride and sulfur had a tendency to accumulate, and fluid-like interiors which dried to a powder. The dissolved organic material and bacteria are believed to catalyze iron corrosion. Deteriorating iron pipes can cause release of pathogenic and toxic materials, taste and color problems, increased treatment demands, and loss of hydraulic capacity. (Cassar-FRC)

TOWARDS A NITRATE BALANCE FOR ENGLAND AND WALES,
Department of the Environment, Reading (England). Water Data Unit.
T. J. Marsh.
Water Services, Vol 84, No 1016, p 601-606, October, 1980. 6 Fig, 2 Tab, 44 Ref.

Descriptors: *Nitrates, *Fertilizers, *Agricultural runoff, Water pollution sources, *England, *Wales, Nitrogen compounds, Rivers, Water quality, Nitrogen fixation, Path of pollutants, Runoff, Sewage effluents, Waste dilution.

Nitrate levels in lowland rivers in England and Wales are expected to exceed 11.3 mg nitrogen per liter by the mid-1980's. Although sewage effluent and biological fixation contribute some nitrate to the total, agricultural runoff from fertilized lands is the major factor. Since it is unlikely that fertilizer use will decline in the future, it is vital for water suppliers to monitor raw water supplies so that appropriate treatment may be instituted. Results from nitrate sampling at 245 river water monitoring stations show that since 1955 nitrate-nitrogen levels have increased by 44 to 488%. Estimated total nitrate load reaching the tidal limits is 275,000 tons, with 150,000 tons produced by human wastes and 125,000 tons from land runoff. (Cassar-FRC)

DON'T UNDERESTIMATE URBAN RUNOFF PROBLEMS,
Municipal Environmental Research Lab., Cincinnati, OH.
R. Field, and R. Turkeltaub.
Water and Wastes Engineering, Vol 17, No 10, p 48-52, October, 1980. 6 Fig, 3 Tab, 8 Ref.

Descriptors: *Urban runoff, *Storm runoff, *Combined sewers, *Water pollution sources, Organic matter, Dissolved oxygen, Coliforms, Chemicals, Toxicity, Projects, Combined sewer overflow.

While the major emphasis in water pollution control has been on secondary treatment plants, urban stormwater and combined sewer overflow play significant roles in water problems. Only within the past 20 years has it been recognized that runoff contains pollutants picked up from littered streets, dusty roofs, traffic byproducts, hazardous spills, and chemicals used as fertilizers or to control ice. The average BOD of domestic and storm sewer overflow is about one half that of raw sewage, but storm runoff and overflows of great magnitude have a shock loading effect. Forty to 80% of the total organic load entering receiving waters can be caused by runoff. Studies are cited which link dissolved oxygen depletion with urban runoff and excessive fecal coliforms with combined sewer overflow. Toxicity problems can be long-term effect or a short-term emergency; one four-hour storm caused 24,000 gal of oil and grease to bypass New York City's Newtown Creek treatment plant. EPA's Storm and Combined Sewer Research, Development, and Demonstration Program is described. This has as its ultimate goal the control of runoff and combined sewer overflows. (Small-FRC)

HEAVY MINERAL DISTRIBUTION IN BOTTOM SEDIMENTS OF THE BRISTOL CHANNEL, U.K.,
University Coll. of Swansea (Wales). Dept. of Oceanography.
J. V. Barrie.
Estuarine and Coastal Marine Science, Vol 11, No 4, p 369-381, October, 1980.

Descriptors: *Sediments, *Heavy metals, *Channels, Hydraulics, Geologic history, Mineralogy, Bristol channel(UK), United Kingdom, *Bottom sediments.

The influence of channel hydraulics on the light and heavy mineralogy of bottom sediments of the Bristol Channel (United Kingdom) was investigated. Mineral analyses were made of movable noncohesive upper layer benthic sediment. A gradational lateral change in mineralogy was found along the longitudinal axis of the channel, closely following the bathymetric isobaths. The change in mineral composition is coupled with increasing hydraulic inequivalence towards the shallow foreshore zone. Hydraulic equivalence/inequivalence results in selective concentration or dilution of certain minerals. Deviations from standard hydraulic equivalence are indications of distance from source and especially of hydraulic and boundary roughness conditions. Thus, the Holocene transgression within the Bristol channel and the modern hydrodynamic scheme result in the observed heavy mineral distribution. (Small-FRC)

Estuarine and Coastal Marine Science, Vol 11, No 4, p 383-391, October, 1980. 1 Fig, 2 Tab, 26 Ref.

Descriptors: *Phosphorus, *Sediments, *Rivers, Estuaries, Soil chemistry, *Suspended sediments, Water chemistry, Algae, Particle size, Mineralogy, Amazon River.

The input of riverborne phosphorus in various particulate forms to the phosphorus budget of the Amazon estuary is evaluated. Samples of Amazon suspended sediments were collected upstream from any tidal influence and analyzed for phosphorus content. Sea water, nitrilotriacetic acid (NTA), K2S2O8, and Na2CO3 fusion extrations were used to determine total flux of phosphorus. Substantial quantities of phosphorus were released from naturally suspended sediments when the sediments were kept in sea water or NTA. Potential availability of phosphorus to algae was estimated at 137 microgram per liter of river water using studies which correlated utilization of sediment phosphorus with freshwater phytoplankton counts. Flux calculations indicate that available particulate phosphorus may be as much as 15 fold greater than dissolved PO4-P (soluble reactive phosphate) during the Amazon rainy season. Dissolved phosphorus would be important only during the dry season. (Small-FRC)

CONCENTRATION AND MICROBIOLOGICAL UTILIZATION OF SMALL ORGANIC MOLECULES IN THE SCHELDT ESTUARY, THE BELGIAN COASTAL ZONE OF THE NORTH SEA AND THE ENGLISH CHANNEL,
Brussels Univ. (Belgium). Lab. of Oceanography.
G. Billen, C. Joiris, J. Wijnant, and G. Gillain.
Estuarine and Coastal Marine Science, Vol 11, No 3, p 279-294, September, 1980. 5 Fig, 4 Tab, 44 Ref.

Descriptors: *Mathematical models, *Microorganisms, *Organic matter, Bacteria, *Estuaries, Oceans, Amino acids, Scheldt estuary, North sea, English Channel.

Concentrations and utilization rates of alanine, aspartate, lysine, glucose, and glycollic, acetic and lactic acids were determined over a seasonal cycle of the water column at three sites: Scheldt estuary, coastal North Sea, and the English Channel. No correlation was observed between the trends of geographical variation of concentration of substrates on one hand, and of utilization rates on the other. Substrate concentrations were not very different at the three sites, while utilization rates differed greatly, with estuarine being the highest, coastal the next highest, and open sea the lowest. A simple model is presented to explain these results. The steady state concentration of a particular substrate is independent of its rate of production and consumption and depends only on physiological characteristics of the bacteria. Using data available in the literature on physiological parameters of marine bacteria, the model accounts for at least the order of magnitude of substrate concentrations observed, and the absence of important seasonal variations. THE DISTRIBUTION OF PELAGIC TARS AND PLASTICS IN THE SOUTH ATLANTIC BIGHT,
South Carolina Wildlife and Marine Resources Dept., Charleston.
R. F. Van Dolah, V. G. Burrell, Jr., and S. B. West.
Marine Pollution Bulletin, Vol 11, No 12, p 352-356, December, 1980. 2 Fig, 2 Tab, 18 Ref.

Descriptors: *Plastics, *Tars, *Oil pollution, Atlantic Ocean, Water pollution sources, Polystyrene beads, Oil wastes, Southeast U.S., Currents(Water), Gulf Stream, Transportation, Ships, Coasts, South Atlantic Bight.

Samples of pelagic tars and plastics were collected by neuston net during six cruises of the R/V Dolphin during 1973-1975 along the Atlantic Coast between 26 and 34 degrees north latitude (Cape Fear, NC. to Cape Canaveral, FL.). Tars were widely distributed throughout the South Atlantic Bight. However, more offshore samples (water depth 200 feet or greater) contained tar, 38.7 to 100%, as compared with near shore samples (water depth less than 200 feet), 26.7 to 72.3%. Tar was detected in a greater percentage of offshore samples during spring than at other times of the year, showing the effect of seasonal currents. Plastic beads, whose distributional patterns were similar to those of tar, were detected in 14.6 to 34.2% of the samples. These results agree with previous work, except that plastic beads were found further south than in the past studies. The authors conclude that the higher incidence of tar and plastic in offshore waters combined with lack of increased concentration of these pollutants near South Atlantic industrial areas indicates that the primary source of contamination is from other areas through entrainment by currents and shipping traffic. HYDROCARBONS IN VICTORIAN COASTAL WATERS,
International Lab. of Marine Radioactivity, Monte Carlo (Monaco). Oceanographic Museum.
K. A. Burns, and J. L. Smith.
Australian Journal of Marine and Freshwater Research, Vol 31, No 2, p 251-256, April, 1980. 1 Fig, 1 Tab, 13 Ref.

Descriptors: *Sea water, *Oil pollution, *Organic compounds, Analytical techniques, Municipal wastes, Industrial wastes, Mussels, Sediments, Oil spills, Coasts.

Sea water was analyzed for suspended and dissolved hydrocarbons to study the distribution of petroleum in Victorian coastal waters from chronic sources of oil pollution. A resin adsorption apparatus consisting of a glass fiber prefilter and a stainless column packed with Amberlite AXD-2 and teflon particles was used. Three areas of Victorian coastal waters were selected because of their importance in water quality management. Gas chromatographic and fluorescence patterns were used to distinguish between petroleum hydrocarbons and recent biogenic hydrocarbons. Levels of nonvolatile hydrocarbons in sea water ranged from less than 0.1 microgram/liter (the detection limit) to over 22 microgram/liter near shore-based inputs such as oil refinery effluents. Port Phillip Bay was exposed to higher oil loads than Western Port. Oil refinery effluent was the major input, but there were also various municipal and industrial effluents. Analyses of mussels and sediments confirmed the oil pollution problem in Port Phillip Bay area. Most Western Port areas were free of the effects of oil pollution, although there were intermittent fuel oil spills near wharves. (Small-FRC)

VERTICAL DISTRIBUTION OF METALS IN A SEDIMENT CORE OF A SUBALPINE LAKE INDICATING STAGES IN THE DEVELOPMENT OF CIVILIZATION. (VERTIKALE VERTEILUNG VON METALLEN IM SEDIMENT EINES ALPENVORLANDSEES ALS ZIVILISATIONSINDIKATOREN),
Munich Univ. (Germany, F.R.). Geographisches Inst.
G. Michler, K. Simon, F. Wilhelm, and C. Steinberg.
Archiv fur Hydrobiologie, Vol 88, No 1, p 24-44, February, 1980. 8 Fig, 2 Tab, 32 Ref. (English summary).

Descriptors: *Lake sediments, *Water pollution, Municipal wastes, Cores, Sampling, Metals, Varves, Water pollution, Runoff, Salts, Agricultural runoff, Lakes, Fertilizers, Coal mine wastes, *Bottom sediments, Age, Geologic history, *Bavaria.

A 382 cm sediment core taken from a subalpine lake in Upper Bavaria was examined for pigment content, loss on ignition and metal content (Na, K, Mg, Ca, Fe, Mn, Ni, Pb, Cd, Zn, Cu, and Cr). Loss on ignition and examination of varves showed a nearly constant rate of sedimentation over the past 1500 years, with an average yearly rate of 2.3-2.5 mm. Increased rates of sedimentation were found in the upper layers due to the development of eutrophic conditions in the lake. Anthropogenic influences were noted in the pattern of metal distributions. The increased Na and Cu levels at a depth of 170-180 cm were associated with deforestation during the 13th century, while increases in Mg reflected deforesting in the 14th century. Steady increases in Zn and Cd above 55 cm were connected with coal mining activities in nearby cities. The industrial expansion of the 20th century was observed in increased levels of Cr, Zn, Cd, and Pb, with accompanying greater motor traffic and municipal sewage pollution. High levels of Na and K in the uppermost layers were attributed to highway salting and the use of artificial fertilizers. (Geiger-FRC)

POLYCHLORINATED BIPHENYLS IN THE BRISBANE RIVER ESTUARY, AUSTRALIA,
Griffith Univ., Nathan (Australia). School of Australian Environmental Studies.
G. R. Shaw, and D. W. Connell.
Marine Pollution Bulletin, Vol 11, No 12, p 356-358, December, 1980. 1 Tab, 12 Ref.

Descriptors: *Estuaries, *Water pollution sources, *Polychlorinated biphenyls, Aquatic animals, Food chains, Water birds, Food webs, Birds, Fish, Mollusks, Crabs, Arochlors, Sediments, Organic chemicals, Industrial wastes, Chemical wastes, Brisbane River(Australia), *Australia.

Concentrations of polchlorinated biphenyls (PCB) in water, sediments, fish, molluscs, polychaetes, and birds from the Brisbane River estuary were determined. Levels in samples from this industrial area of 900,000 population were similar to those in comparable urban locations. A table lists the species, sample type (for example, whole organism, lipid basis, etc.), and range of concentrations for Aroclor 1254 and 1260. In fish, the PCB concentration was higher in the gills than in muscle, on a lipid content basis. The chromatogram pattern implied that PCB's enter through the gill. Biomagnification of PCB in the food chain did not correlate with trophic class. The sea mullet, which has a low trophic class, showed high concentrations (maximum 2.9 mg per kg). However, the pelican, high on the food chain, exhibited the highest concentration (up to 15.7 mg per kg in muscle). (Cassar-FRC)

Water samples were taken for nitrogen and phosphorus from late 1975 through to the Spring of 1977 from nine stations. The drainage system had supported giant duckweed (Spirodela punctata) blooms. While seasonal separation of the data showed possible differences within an impoundment (Bayview Lake), extreme variations made meaningful conclusions difficult to obtain. Daily discharge from a large number of points may have masked seasonal differences. Extensive plant mats were present at minimal levels of nitrogen and phosphorus. The growth rate appeared to be governed more by climate than by nutrient conditions. Laboratory studies indicated that giant duckweed can grow under a wide range of nutrient conditions, including heavy metal concentrations. Growth rate data demonstrated that, without a continual input of nutrients, maximum growth rates do not typically continue beyond 14-20 days, regardless of the initial single element concentration. However, using a continuous nutrient input, growth would probably be inhibited only by extreme climate conditions. (Zielinski-IPA)

LAKE ERIE NUTRIENT CONTROL: EFFECTIVENESS REGARDING ASSESSMENT IN EASTERN BASIN.
State Univ. of New York Coll. at Buffalo. Great Lakes Lab.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-225097, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/3-80-067, July, 1980. 100 p, 26 Fig, 18 Tab, 30 Ref. R802706.

Descriptors: *Lake Erie, *Limnology, *Eutrophication, *Biota, Great Lakes, Water pollution, Invertebrates, Phytoplankton, Zooplankton, Benthos, Oxygen demand, *Nutrients, Aquatic environment, Water temperature, Biomass, Phosphorus, Nitrogen, Mesotrophy, Aquatic populations.

A three year synoptic monitoring program was conducted on 26 stations in the Eastern Basin of Lake Erie from 1973 to 1975. The data generated include major nutrients, temperature structure, and oxygen depletion as well as phytoplankton, zooplankton and benthic macroinvertebrate dynamics. The Eastern Basin surface waters were differentiated into five discrete areas with each water mass characterized by a different physiochemical variable. These areas appeared to be highly influenced by local inputs from specific tributaries and population centers. Anoxic conditions were not observed in the hypolimnetic waters of the Eastern Basin over the study duration and the oxygen demand was calculated to be approximately 0.011 g oxygen/cubic meter/day. The Eastern Basin has remained relatively stable over the past five years with the exception of a decrease in phytoplankton biomass, increase in nitrogen, and a doubling of benthic macroinvertebrates. Several organisms, especially the oligochaetes, associated with more eutrophic values of the Western and Central Basin have become established in large numbers within the Eastern Basin. From a trophic standpoint, the basin can be classified as mesotropic. Reductions in algal growth may be in response to pollution abatement, particularly phosphorus. (Moore-SRC)

Descriptors: *Estuarine environment, *Washington, *Water pollution, *Sediments, *Aquatic animals, *Animal pathology, Chlorinated hydrocarbon pesticides, Water pollution effects, Invertebrates, Fish, Arsenic, Lead, Organic compounds, Polychlorinated biphenyls, Metals, Oil pollution, Benthic fauna, Crabs, Shrimp, Clams, Worms, Puget Sound(WA).

Samples of sediments and bottom-dwelling fishes, crabs, shrimps, clams, and worms were collected at quarterly intervals in 1979 from four urban embayments in Puget Sound: Elliott Bay (Seattle), Commencement Bay (Tacoma), Sinclair Inlet (Bremerton), and Budd Inlet (Olympia). Similar sampling was done in two nonurban areas: Case Inlet and Port Madison. Sediment samples were analyzed for petroleum hydrocarbons, polychlorinated biphenyls, chlorinated pesticides and other chlorinated organic compounds, and metals. The community characteristics of the sediment-associated invertebrates and bottom fish were defined; and their tissues were analyzed for the above-mentioned organic compounds and metals. The highest concentrations of the organic compounds and some metals, such as arsenic and lead, in sediments were in samples from the waterways of Commencement Bay; the Duwamish Waterway, Seattle Watefront, and West Point areas of Elliott Bay; and from Point Herron in Sinclair Inlet. Highest concentrations of many of the chlorinated organic compounds, including hexachlorobutadiene, were in sediment samples from Commencement Bay and its adjacent waterways. Tissue samples generally had concentrations of organic contaminants which reflected the chemical composition of sediment in the subarea from which the organisms were obtained. Petroleum hydrocarbons, polychlorinated biphenyls, chlorinated pesticides, hexachlorobenzene, and hexachlorobutadiene were detected in various concentrations in several types of organisms from both urban and nonurban sites. In most cases animals were also examined for grossly visible and microscopic lesions. Several types of liver lesions were found more frequently in fish from sampling areas with the sediments most highly contaminated by toxic chemicals. Abnormalities were also found in shrimp and crab species in the most polluted areas. (Moore-SRC)

EFFECTS OF THERMAL POLLUTION ON PELAGIC LARVAE OF CRUSTACEA,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
A. N. Sastry.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-222037, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/3-80-064, July, 1980. 65 p, 25 Fig, 13 Tab, 68 Ref. R-800981.

Descriptors: *Thermal pollution, *Crustaceans, *Larvae, *Estuarine environment, *Salinity, Invertebrates, Water pollution, Growth stages, Coasts, Physiological ecology, Animal physiology, Environmental effects, Cycles, Animal metabolism, Commercial shellfish, Lobsters, Crabs, Shrimp, Water temperature.

Thermal alterations of the coastal and estuarine environments from conventional and nuclear power plants may have considerable effects on the biotic communities. To develop the capability for assessment of the effects of thermal alterations, there is a need for a comprehensive understanding of the effects of thermal changes on all the life stages of populations within the communities. Larvae of six species were studied: Cancer irroratus, C. borealis and Homarus americanus of coastal waters; and Palaemonetes pugio, Pagurus longicarpus and Rhithropanopeus harrisii, from the estuarine region. Larvae were cultured at various combinations of temperature and salinity, and highest survival rates and limits for complete development determined. Generally, coastal species had a more restrictive temperature range for complete development than estuarine species. Survival was betteer for C. irroratus larvae cultured under certain daily cyclic regimes versus a constant temperature. The larvae of coastal species C. irroratus and H. americanus were metabolically active over a narrower temperature range compared to the primar-

ily estuarine species Palaemonetes pugio. Metabolic - temperature response patterns of the larval stages of each species cultured at daily cyclic temperatures were altered relative to those cultured at comparable constant temperatures. When temperature and low dissolved oxygen stresses were combined, the thermal tolerance limits of C. irroratus larval stages were altered. (Moore-SRC)

CHARACTERISTICS OF BENTHIC ALGAL COMMUNITIES IN THE UPPER GREAT LAKES,
Michigan Univ., Ann Arbor. Great Lakes Research Div.
E. F. Stoermer.
Environmental Protection Agency Report EPA-600/3-80-073, July, 1980. 79 p, 1 Tab, 16 Ref, Append. 803037.

Descriptors: *Great Lakes, *Benthic flora, *Eutrophication, *Aquatic algae, Water pollution, Water quality, Algae, Benthos, Diatoms, Limnology, Oligotrophy, Distribution.

The upper Great Lakes contain a diverse array of benthic algal communities. Diatoms are the dominant taxonomic group present in terms of numbers, and usually in terms of biomass, except in eutrophic areas. Communities in areas receiving minimal direct anthropogenic impact are extremely diverse in terms of both species richness and population evenness. A significant number of populations found in undisturbed habitats in the upper Great Lakes have not been previously reported from North America. Benthic communities in more eutrophic areas are characterized by a greater abundance of eurytopic and widely distributed taxa. Many of these species are familiar elements of the floras of smaller, mesotrophic to eutrophic lakes. The communities of directly impacted areas contain a more limited suite of very tolerant populations, usually occurring in high abundance. Species usually reported from saline inland waters or brackish water are a conspicuous element of the flora in highly disturbed regions. The available evidence indicates that the range of many oligotrophic species which originally occupied the entire upper Great Lakes has been severely restricted. Such populations are apparently adversely affected by very low levels of contamination, which suggests that they may be useful in early detection of adverse trends in the system. The recent introduction of a number of species not characteristic of oligotrophic systems, or indeed even of freshwater lakes, indicates continuing degradation of the upper Great Lakes. (Moore-SRC)

ENVIRONMENTAL EFFECTS OF WESTERN COAL SURFACE MINING, PART VIII-FISH DISTRIBUTION IN TROUT CREEK, COLORADO, 1975-1976,
Colorado Div. of Wildlife, Fort Collins. Fisheries Research Center.
J. P. Goettl, Jr., and J. W. Edde.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-224736, Price codes: A03 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/3-80-070, July, 1980. 36 p, 3 Fig, 7 Tab, 19 Ref. R803950.

Descriptors: *Mine drainage, *Coal mines, *Fish, *Mine water, Water pollution, Colorado, Brook trout, Rainbow trout, Brown trout, Sculpins, Dace, Fish management, Distribution, Toxicity, Fish stocking, *Environmental effects, *Trout Creek(CO).

A study was conducted on Trout Creek in northwestern Colorado during 1975-1976 to assess the effects of drainage from an adjacent surface coal mine on the distribution of fishes in the creek, and to relate their distribution to physical and chemical variables. A second objective was to determine the possible toxicity off surface coal mine drainage water on fish stocked in ponds receiving surface and groundwater run-off from the mine. Results did not indicate any direct effects of mine drainage water on the distribution of fishes in Trout Creek, although possible effects may have been masked by elevation, stream flow, streambed alterations, and agricultural irrigation return flows. Brook trout (Salvelinus fontinalis) was the dominant salmonid species in the upper reaches of the creek; rainbow trout (Salmo gairdneri) and brown trout (S. trutta) were found only in the region of the mine. Mottled sculpin (Cottus bairdi) and speckled dace (Rhinichtys osculus) were the most common fishes found throughout and at all but the uppermost reaches, respectively. Rainbow trout stocked in mine seepage water ponds for a year evidenced high survival rates over an eight-month period during the winter, but fared poorly during the ensuing summer months, this latter most probably because of extremely high water temperatures. There was no apparent evidence of toxicity to the fish from contaminants in the mine pond water. (Author's abstract)

EFFECTS OF WATER QUALITY ON FISH,
Purdue Univ., Lafayette, IN. Dept. of Forestry and Natural Resources.
A. Spacie.
Purdue University Cooperative Extension Service, 208 Planning Notes, prepared by the Indiana Inter-Agency Information and Education Committee on Non-Point Source Pollution, Planning Note No 9, (1980). 4 p, 1 Fig, 1 Tab.

Descriptors: *Water quality, *Fishkill, *Pollutants, Oxygen, Pesticides, Ammonia, Siltation, Water pollution effects, Fish, *Indiana, Federal Water Pollution Control Act.

This is one of a series of fact-sheets being developed concerning the Federal 'Clean Water Act' (Public Law 92-500) and water quality management planning efforts underway in Indiana, as prescribed by Section 208 of the Law. Major emphasis in the fact sheets is on non-point sources of pollution, their effects on water quality, possibilities for control and the implications of various control strategies, the purpose of this series is to provide an 'information base' for meaningful citizen input into the water quality management planning process at the local level. This fact sheet answers such questions as Who's to blame for fish kills. What are the effects of pollutants. What are the major causes of fish kill, and Will water quality management make a difference.

MICRO-ORGANIC COMPOUNDS IN THE WATER ENVIRONMENT AND THEIR IMPACT ON THE QUALITY OF POTABLE WATER SUPPLIES,
Water Research Commission, Pretoria(South Africa).
G. J. Stander.
Water SA, Vol 6, No 1, p 1-14, January, 1980. 6 Fig, 19 Tab, 25 Ref.

Descriptors: *Organic compounds, *Potable water, *Public health, Pollutant identification, Water quality, Odor, Taste, *Water pollution effects, Reviews, Chlorination, Water purification, *Water treatment, Pollutants.

Sources of organics in natural waters are decay of animal and plant life, biological activities, industrial wastes, domestic wastes, and non-point sources such as agricultural chemicals and combustion products. Although up to 360 organic compounds have been identified in drinking water in a number of countries, only about 50 occurred at concentrations above 1 microgram per liter. Since analysis of water for micro-organics is very costly, it is suggested that bioassay screening tests be performed on water supplies most likely to be polluted with organic chemicals. If these tests have positive results, further identification and toxicologic studies should be performed. Chlorination may intensify odor and taste problems by forming undesirable halogenated hydrocarbons. Treatment plants which remove trace organic compounds completely are beyond practical considerations. Therefore, it is better to clean up industrial and sewage effluents before they reach the water purification process. (Cassar-FRC)

NUTRIENT RUN-OFF FROM THE CATCHMENT AREA TO A SMALL LAKE WITH NO EFFLUENT,
Instytut Gleboznawstwa i Chemii Rolnej, Lublin (Poland).
M. Misztal.
Acta Hydrobiologica, Vol 22, No 1, p 55-66, 1980. 3 Fig, 3 Tab, 13 Ref.

Descriptors: *Nutrients, *Agricultural runoff, *Lake sediments, Water chemistry, Watersheds(Basins), *Lakes, Soil chemistry, Phosphorus, Calcium, Sodium, Potassium, Precipitation(Atmospheric), *Poland, Inflow.

The effects of agricultural runoff and woodland runoff on the chemical composition of shallow sediments in Lake Piaseczno (Leczynsko-Wlodawshie Lake District, Poland) were examined. The catchment area is made up of 48 ha of woods, 85 ha of water, and 131 ha of agricultural lands. Soils in the catchment area and lake sediments were sampled and analyzed for chemical content. K(+), Na(+), Ca(++) were determined by the photmetric method, while P was determined with ammonium molybdate, and Mg(++) was determined with titanium yellow. Rainfall during the sampling period (1973-1976) was also measured. Correlation coefficients indicated a close relationship between water soluble forms of potassium salt, manganese, and sodium found in both the soil and the sediments. No correlation was found between their contents of phosphorus compounds. The effects of rainfall were noted. High water levels in the lake tended to counteract penetration of enriched groundwaters into its basin. Drought was not conducive to the accumulation of phosphorus compounds, while during a wet year (1974), water soluble forms of phosphorus increased in the lake Lake water pH was highest during times of increased rainfall. SIMULATION OF SOIL NUTRIENTS LOSSES RESULTING FROM RAINFALL ACIDITY,
Colorado State Univ., Fort Collins.
J. O. Reuss.
Ecological Modelling, Vol 11, No 1, p 15-38, October, 1980.

Descriptors: *Mathematical models, *Acidic water, *Leaching, Soil properties, Precipitation(Atmospheric), Nutrients, *Soil chemistry, Ion exchange, Ions, Chemical reactions, *Acid rain, Adsorption.

A simulation model is described which provides a quantitative system using basic soil chemistry to predict the most likely effect of rainfall acidity on the leaching of cations from noncalcareous soils. The model uses the relationships between lime potential and base saturation (Clark and Hill, 1964, and Turner and Clark, 1964), the equilibrium between CO2 partial pressure and H+ and HCO3- in solution, the apparent solubility product of Al(OH)3, the equilibrium of cations and anions in solution, the Langmuir isotherm description of sulfate adsorption, and mass balance considerations. It predicts the distribution of ions between the solution and sorbed or exchangeable phases. Thus, ionic composition of leachate can be computed. The initial model results indicate that base removal due to rainfall acidity from actual soil systems can be investigated experimentally by increasing the acidity of applied water to levels in excess of that normally found in rain. This shortens the necessary experimental time. (Small-FRC)

CORRELATION BETWEEN UREA AND OTHER CHEMICAL AND BIOLOGICAL PARAMETERS IN WATERS OF LAKE SUWA, JAPAN,
Yamagata Univ. (Japan). Dept. of Chemistry.
Y. Satoh, T. Okino, and K. Aoyama.
Internationale Revue der Gesamten Hydrobiologie, Vol 65, No 3, p 445-454, 1980. 3 Fig, 1 Tab, 29 Ref.

Descriptors: *Ureas, *Eutrophication, *Decomposing organic matter, Nutrients, *Lakes, Nitrogen, Phytoplankton, Photosynthesis, *Japan, Lake Suwa(Japan).

The vertical profiles of chemical and biological treatment parameters, including urea concentration, were measured periodically since 1977 in Lake Suwa, Japan, a typical eutrophic lake. The standing stock of urea in a central water column of the lake showed two major peaks around May 1977 and May 1978, and three minor peaks around early August, late September, and mid-November 1977. These peaks may be due at least in part to urea production by bacterial decomposition of dead phytoplankton. The ratio between standing stock of urea and that of total inorganic nitrogen in the eutrophic zone increased significantly from mid-July to early October in 1977. This ratio was significantly lower the rest of the year; however, the standing stock of urea was relatively high. On the basis of Kendall's rank correlation coefficient, urea has been suggested to act as a nutrient during the process of photosynthesis on 7 days out of 33 observed. Also, the tau coefficients of urea to ammonia, nitrite, total carbonate carbon, gross production, net production, dissolved oxygen, and pH demonstrated a correlation significant enough to support the assumption that urea acted as a nutrient in the course of photosynthesis by phytoplankton. Thus, the vertical distribution of urea may be regulated by the photosynthetic activities of phytoplankton on certain occasions. (Small-FRC)

CHEMICAL AND MINERALOGICAL COMPOSITION OF THE MUD-WATER INTERFACE OF THE LAKE HULEH (ISRAEL) PRESERVE,
Pittsburgh Univ., PA. Dept. of Biological Sciences.
U. M. Cowgill.
Internationale Revue der Gesamten Hydrobiologie, Vol 65, No 3, p 379-409, 1980. 25 Fig, 43 Ref.

Descriptors: *Mud-water interfaces, *Lake sediments, *Chemical reactions, On-site investigations, Sediments, Ponds, Rivers, Sediment transport, Sorption, *Israel, Metals, Elements(Chemical), Mineralogy.

The chemical composition of the mud-water interface of a shallow pond with an inlet and an outlet was determined. Elements found in the mud-water interface of Lake Huleh Preserve (Israel) to a greater extent than in the surface waters were: Na, K, Ca, Ag, Cu, Mg, Sr, Ba, Zn, B, Ga, Se, Y, La, Ce, Si, Ge, Pb, Hf, P, As, Nb, S, Se, Cr, F, Mn, Co, and Ni. Some elements, including Br and Cd, are sorbed and retained by organic matter. Others behave as a sort of colloidal soup; elements (Cs, Be, Hg, Sn, Ti, Zr, Bi, V, Mo, I, and Fe) are sorbed by the scavenger action of ferric hydroxide type complexes. A chemical comparison of the composition of the Jordan River before and after it leaves the preserve gives some indication of the contributions of the river. Elements that showed a positive effect were: Na, Rb, Cu, Mg, Ca, Ba, Zn, Cd, Al, Ga, Y, La, Ce, Si, Ge, Sn, Pb, and others. The drainage of carp ponds into the preserve has a chemical effect on the Jordan River. (Small-FRC)

ACIDIFICATION OF A SMALL WATERSHED IN SOUTHERN NORWAY AND SOME CHARACTERISTICS OF ACIDIC AQUATIC ENVIRONMENTS,
Oslo Univ. (Norway). Zoological Inst.
J. P. Nilssen.
Internationale Revue der Gesamten Hydrobiologie, Vol 65, No 2, p 177-207, 1980. 11 Fig, 6 Tab, 109 Ref.

Descriptors: *Air pollution, *Acidity, *Lakes, Fish, Aquatic life, Small watersheds, Precipitation(Atmospheric), Invertebrates, Plankton, Hydrogen ion concentration, *Norway, *Acid rain.

Freshwater lakes in a region of southern Norway which receives a substantial amount of atmospheric pollutants were studied for acidity and biolgical characteristics. Precipitation in the area has a pH of 4.2-4.5. The acid originates further south in Europe, but prevailing winds bring this pollution to Norway. In some lakes which have lost buffering capacity, spring thaw and autumn rain are accompanied by increases in conductivity and in sulfate deposition, and by a conspicuous drop in pH. Decreasing pH, increasing conductivity, and increasing total hardness have been observed in a river draining the area. Fish, daphnia, and chaoborus have disappeared from the most acidic lakes, and these lakes are characterized by increasing abundance of Juncus bulbosus and macrophytes covered by filamentous algae. Pelagic zooplankton are mainly of the littoral species, and there are no leeches or gastropods. Brown trout is the fish most resistant to acid, while Eurasian perch were absent from most of the acid lakes. Moderately acidic lakes contained abundant food for carnivorous fish. (Small-FRC)

ON THE MECHANISM REDUCING THE PHOSPHATE CONCENTRATION IN THE WATER OF LAKE BALATON,
Research Inst. for Water Resources Development, Budapest (Hungary). Inst. for Water Quality Control.
E. Dobolyi, and S. Herodek.
Internationale Revue der Gesamten Hydrobiologie, Vol 65, No 3, p 339-343, 1980. 3 Fig, 3 Ref.

Descriptors: *Phosphorus compounds, *Nutrient removal, *Organic matter, *Hungary, Eutrophication, Algae, Lake Balaton(Hungary), Phosphates, Water pollution, Lake sediments, Aquatic algae, Plankton, Lakes, Bacteria, Aquatic life.

The main process responsible for phosphate reduction in Lake Balaton, Hungary, was direct uptake by algae. Although this lake's phosphate load grows continually, the dissolved orthophosphate has remained at a low level, 1 to 14 micrograms per liter. When phosphate was added to lake water in situ and in vitro, it was quickly removed. However, addition of sodium hypochlorite to kill algae and bacteria caused the phosphate level to remain constant, showing that biolgical activity was responsible for phosphate removal. When a complexing agent was added to prevent formation of biogenic lime, it did not influence rapid phosphate removal. A photooxidation experiment also showed that phosphate was incorporated into organic particulate matter. (Cassar-FRC)

COMBINED EFFECT OF THE CHLORIDES OF MERCURY AND COPPER IN SEA WATER ON THE EURYHALINE AMPHIPOD GAMMARUS DUEBENI,
Southhampton Univ. (England). Dept. of Oceanography.
S. M. Moulder.
Marine Biology, Vol 59, No 4, p 193-200, 1980. 5 Fig, 2 Tab, 19 Ref.

Descriptors: *Mercury, *Copper, *Amphipoda, *Water pollution effects, Metals, Sea water, Aquatic animals, Crustaceans, Invertebrates, Toxicity, Absorption, Water quality standards, Interactions.

A sublethal level of copper reduced the toxicity of inorganic mercury in Gammarus duebeni, a euryhaline amphipod. The metals, used as chlorides, were tested using 3 independent methods: 96 hours LC50, diuresis, and degree of Hg accumulation. LC50 values were as follows: Cu only, greater than 10,000; Hg only, 122; Hg preceded by pretreatment with a sublethal dose of Cu, 165; Hg plus Cu, 1520. Likewise, Cr51-EDTA clearance tests showed that Cu and Hg together (t1/2 value 81.3 hours) had less influence on diuresis than their additive effects (81.9 and 67.9 hours, respectively). Cu and Hg together produced less Hg accumulation in Gammarus than a program of Cu pretreatment followed by Hg exposure. This was also true in organic-free media. Hg accumulation concentration factors after 25 hours were Hg alone, 340; Hg plus Cu, 62; and Hg with Cu pretreatment, about 50. The possible mechanisms of interaction between Hg and Cu, including binding on SH sites and detoxification, were discussed. (Cassar-FRC)

FISH POPULATION DYNAMICS UNDER NUTRIENT ENRICHMENT - A CASE OF THE EAST SETO INLAND SEA,
Kyoto Univ. (Japan). Dept. of Applied Mathematics and Physics.
S. Ikeda, and T. Yokoi.
Ecological Modelling, Vol 10, No 3/4, p 141-165, August, 1980. 16 Fig, 7 Tab, 11 Ref.

Descriptors: *Mathematical models, Fish, *Predation, Plankton, *Fish populations, Eutrophication, Nutrients, Nitrogen, Phosphorus, Environmental effects, Mortality, *Seto Inland Sea(Japan), Japan.

A theoretical model of fish population dynamics in a primarily nitrogen and phosphorus enriched eutrophic inland sea is presented. A significant increase in pollutants in the sea and the slow exchange rate of sea water between the sea and the ocean have worsened the general condition of the East Seto Inland sea in recent years. The proposed model is based on the prey-predator relationship of the Lotka-Volterra type. The model was validated by checking recent fishery statistics of the area. The three population variables are: plankton, small fish, and large fish. Assessment of the effect of external pollution loading was essential for the identification of fish population dynamics in the sea. The simulation shows that the assumptions on fish mortality and carrying capacity of plankton in the nutrient-enriched sea could partially explain trends in recent fish catches. (Small-FRC)

THE TURNOVER RATE OF DISSOLVED ORGANIC MATERIAL IN WATERS USED BY ANADROMOUS PACIFIC SALMON ON THEIR RETURN TO GREAT CENTRAL LAKE ON VANCOUVER ISLAND, BRITISH COLUMBIA, CANADA,
Tsukuba Univ., Ibaraki (Japan). Inst. of Biological Sciences.
H. Seki, E. A. MacIsaac, and J. G. Stockner.
Archiv fur Hydrobiologie, Vol 88, No 1, p 58-72, February, 1980. 3 Fig, 4 Tab, 26 Ref.

Descriptors: *Oligotrophy, *Fish migration, *Salmon, *Aquatic ecosystems, Nitrogen, Phos-

phorus, Nutrients, *Organic matter, Carbohydrates, *Lakes, Microbial degradation, Fertilizers, Spawning, Sockeye slamon, Phytoplankton, Aquatic productivity, Water quality, Pulp wastes, Surface waters, *Great Central Lake(Canada), Vancouver Island(BC), British Columbia.

When salmon return to freshwaters to spawn, it is theorized that an olfactory imprinting device allows them to locate their parent stream. The turnover rate of dissolved organic materials by microbial activity is considered an important factor in the chemistry of this aquatic spawning system. In the present study, the uptake kinetics of a variety of organic substrates in the surface layer of aquatic systems through which adult salmon pass on their return to Great Central Lake inlet were examined. Particulate organic carbon levels were highest in surface waters of Trevor Channel and central Alberni Inlet. This was attributed in part to the organic matter discharged by the pulp mill at the head of the inlet. The microbial differences of fertilized and unfertilized areas of this Canadian lake were also studied, and the increases in primary production in response to phosphorus and nitrogen additions were investigated. Turnover times were a few weeks at the entrance to Alberni Inlet, a few days in central Alberni Inlet, a few weeks in the Stamp River, a few weeks for amino acids and galactose, and less than several days for organic acids and glucose in Great Central Lake. Fertilized regions produced higher microbial biomass, a concept which is discussed in terms of increased organic excretions from the growth-stress oscillating phytoplankton population. Heterotrophic uptakes and primary production indicate that the Great Central Lake is within the steady-state equilibrium of a temperate oligotrophic lake. (Geiger-FRC)

THE EFFECT OF EMERSION ON CADMIUM ACCUMULATION BY MYTILUS EDULIS,
Victoria Ministry for Conservation, Queenscliff (Australia). Marine Science Labs.
N. Coleman.
Marine Pollution Bulletin, Vol 11, No 12, p 359-362, December, 1980. 2 Tab, 25 Ref.

Descriptors: *Cadmium, *Mussels, *Water pollution effects, Metals, Aquatic animals, Shellfish, Path of pollutants, Victoria(Australia), *Australia, Mytilus edulis, Submergence, Littoral.

Mussels were immersed for 15 days in sea water and in sea water containg 0.35 ppm or 0.035 ppm cadmium either continuously or alternately submerged and drained. Results, expressed in ppm Cd per dry weight, were as follows: sea water drained, 1.13 + or - 0.42; sea water undrained, 1.57 + or - 2.17; 0.035 ppm Cd drained, 24.1 + or - 6.61; 0.035 ppm Cd undrained, 38.96 + or - 27.03; 0.35 ppm Cd drained, 155.5 + or - 55.06; 0.35 ppm Cd undrained, 277.55 + or - 93.28. Lowest Cd concentrations were found in drained mussels in sea water; highest in mussels in undrained water containing 0.35 ppm Cd. Although drained mussels were submerged for only half as long as undrained mussels, they accumulated more than half as much Cd. This may have been the result of increased activity upon reimmersion. After only 15 days, mussels exposed to 0.035 ppm Cd, permissible under current legislation in Victoria, accumulated more than the 2.0 ppm net weight limit specified for human consumption. (Cassar-FRC)

TISSUE DISTRIBUTION OF MERCURY IN NORMAL AND ABNORMAL YOUNG COMMON TERNS,
Rutgers Medical School, Piscataway, NJ. Div. of Occupational and Community Medicine.
M. Gochfeld.
Marine Pollution Bulletin, Vol 11, No 12, p 362-366, December, 1980. 3 Tab, 27 Ref.

Descriptors: *Mercury, *Birds, *Terns, *Water pollution effects, Water pollution sources, Water birds, Liver, Food chains, *Long Island(NY), New York, Path of Pollutants, Pollutant identification.

The large right lobe of the liver was the single tissue which provided the best estimate of mercury levels in other tissues, according to Hg tissue distribution studies done on 16 young Common Terns from colonies on the south shore of Long Island, New York. Whole blood and kidney had mean correlation coefficients of 0.38 and 0.36 respectively, near that of liver, 0.40. Muscle, brain, and feather showed little correlation, 0.18, 0.02, and 0.22. Levels were highest in blood and lowest in brain. Four birds which showed feather loss had about twice the mercury level in all tissues compared to the 12 normal birds. Levels of Hg in chicks 10-30 days old were slightly, but insignificantly, higher than compared with chicks 1-9 days old. (Cassar-FRC)

5D. Waste Treatment Processes

STATE OF WASHINGTON INDUSTRIAL WASTE SURVEY.
URS Co., Seattle, WA.
Report prepared for Washington State Department of Ecology, 1980. 45 p, 3 Fig, 7 Tab, 3 Append, 14 Maps.

Descriptors: *Washington, *Surveys, *Industrial wastes, *Waste water treatment, *Municipal water, Pollutants, Pre-treatment(Water), Cities, Sewage treatment, Chemical analysis, Pollutants, Organic compounds, Toxicity, Waste dilution, Measurement, Pulp and paper industry.

Many communities treat both industrial and residential waste waters at the municipal waste water treatment plant. The EPA-promulgated Pretreatment Regulation governs the control of industrial wastes into Publicly Owned Treatment Works (POTWs). Washington State needed definitive data to determine which POTWs would require local pretreatment programs. An industrial waste survey was conducted of commercial and industrial users that discharge, or potentially discharge, liquid and solid wastes to the sewer systems of 14 municipalities. Twenty-one industrial categories were included, as were businesses discharging excess pollutants. The survey, directed toward 129 species of chemical compounds representing 65 priority pollutant groups, was in two phases: inventory development, and questionnaire review and follow-up. Industries were initially identified by SIC code to determine suitability. Questions were asked to determine type of waste produced, general waste water characteristics of the facility, and the use and disposal of priority pollutants, Statewide, the major priority pollutant compounds identified included the heavy metals, aromatic and chlorinated hydrocarbons, phenolic compounds and cyanide. The major source of priority pollutants appeared to be paper products firms and inorganic chemical manufacturers. Breweries, photofinishers and hospitals may also produce and/or discharge priority pollutants. Each municipal sewer ordinance was evaluated using EPA's Model Ordinance covering industrial waste dischargers; however, none covered all of EPA's provisions. (Atkins-Omniplan)

FINE SOLIDS REMOVAL FOLLOWING COMBINED CHEMICAL-TRICKLING FILTER TREATMENT,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
J. C. Brown.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-140659, Price codes: A03 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-099, July, 1980. 36 p, 7 Fig, 7 Tab, 1 Ref. 68-03-0225.

Descriptors: *Waste water treatment, *Settling basins, *Filtration, *Suspended solids, Water purification, Chemical precipitation, Sewage treatment, Flocculation, Trickling filters, Treatment, Sludge.

Significant carryover of fine alum floc solids was observed in final effluent during earlier plant-scale studies of alum addition to the final clarifier of a high-rate trickling filter train of a waste water treatment plant. The effectiveness of fine solids settling ponds, and various types of granular media filters for removing residual fine solids from the effluent of a conventional, high-rate, rock media trickling filter plant when alum is applied ahead of secondary clarification is evaluated. Two pilot settling ponds, one covered and one open, were operated at detention times ranging from 8 to 30 hours. Two pilot granular media filters were operated at filtration rates ranging from 1.0 to 2.0 l/sec/square meter. The filters were operated in both downflow and upflow modes, with various media used in each operational mode. The pilot settling ponds did not perform as expected. Anaerobic conditions, which developed in the settled sludge, disrupted the floc structure and resuspended previously settled solids. Very modest improvement in final effluent quality, generally less than 25%, was observed. The two filters when operating in a downflow mode with two different configurations of anthracite and sand media, proved about equal in performance, achieving 65-86% incremental removals of suspended solids. Upflow filter operation produced a slightly lower effluent quality, but resulted in lower rates of headloss buildup and substantially longer filter runs. (Moore-SRC)

JET AERATION CHANNEL SYSTEM,
Houdaille Industries, Inc., Fort Lauderdale, FL.(Assignee).
M. G. Mandt.
U.S. Patent No 4,199,452, 14 p, 7 Fig, 1 Tab, 9 Ref; Official Gazette of the United States Patent Office, Vol 933, No 4, p 1372-1373, April 22, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Sewage treatment, Activated sludge, Oxidation, Flow control, Aerobic treatment.

This invention is directed to aerobic waste water treatment systems having improved energy requirements, which can be adapted to efficiently compensate for diurnal or other variations in sewage flow that are commonly found in medium size sewerage treatment plants. The system comprises an oxidation ditch for confining and retaining the waste liquid and defining a continuous closed flow path through which the confined liquid is moved, a first raw waste pump activated by an intermediate level of raw waste received, a second raw waste pump activated by a high level of raw waste, a first blower activated during operation of either first or second raw waste pumps, gas-liquid contactors for receiving raw waste from either or both raw waste pumps and air from the first blower and for discharging a high velocity raw waste liquid-air jet or mixed liquor into the oxidation ditch below the surface. PROCESS FOR SEPARATING AQUEOUS MINERAL ACID MIXTURES,
Monsanto Co., St. Louis, MO. (Assignee).
R. Chiang, and E. Perry.
U.S. Patent No 4,199,445, 8 p, 5 Ref; Official Gazette of the United States Patent Office, Vol 993, No 4, p 1370-1371, April 22, 1980.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Separation techniques, Acids, Membrane processes, Water vapor, Product concentration.

The separation of components, one of which is water, such as formaldehyde and water, in order to

obtain a more highly concentration solution by removing at least a portion of the water from the feed solution is described. The process comprises contacting the feed mixture against one side of an ionic organic membrane, composed of organic polymers having active anionic groups derived from acids, and withdrawing at the second side a mixture having higher concentration of water. It is also essential that the mixture at the second side be maintained at a lower chemical potential than the feed side. It is also essential that the product be withdrawn at the second side in the vapor state. Multistate operation may also be feasible since this permits the operation of individual stages at various concentrations and temperatures in order to achieve the optimum driving forces for the process. (Sinha-OEIS)
W81-01448

PROCESS FOR DECOLORIZING PULP AND PAPER MILL WASTE WATER,
Sybron Corp., Rochester, NY. (Assignee).
J. E. Blair, and L. T. Davis.
U. S. Patent No 4,199,444, 6 p, 9 Tab, 4 Ref; Official Gazette of the United States Patent Office, Vol 993,, No 4, p 1370, April 22, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, Industrial wastes, *Pulp and paper industry, Bleaching wastes, Color, Aerobic conditions, Microorganisms, Pseudomonas aeruginosa.

The object of this invention is to provide a biological process for the treatment of pulp and paper mill waste water effluent to not only remove biodegradable organic matter, but to specifically reduce or decolorize the waste water. The biological treating process uses a mutant strain of Pseudomonas aeruginosa. The mutant microorganism does not require the addition of carbohydrates to the system and is well adapted to biological treatment systems. (Sinha-OEIS)

APPARATUS FOR REMOVING SUSPENDED OIL DROPLETS FROM WATER,
Exxon Production Research Co., Houston, TX. (Assignee)
R. E. Williams.
U. S. Patent No 4,198,300, 6 p, 1 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 993, No 3, p 986, April 15, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Oily water, Oil pollution, Separation techniques, Bubbles, Coalescence, Equipment, Offshore drilling.

Suspended droplets of oil are separated from a waste water stream by injecting the oil and water mixture into a partially submerged, vertical pipe. Gas bubbles injected into the lower end of the pipe rise through the pipe and countercurrently contact the suspended oil droplets, thereby promoting the separation of the droplets from the waste water. The oil droplets coalesce and form a separate oil layer on top of the waste water which is readily withdrawn while clarified waste water is discharged from the lower end of the pipe. If employed to separate oil from a waste water stream on an offshore rig, the vertical pipe is submerged adjacent to the rig. (Sinha-OEIS)
W81-01454

MICROSCREEN METHOD AND APPARATUS,
Water Pollution Control Corp., Milwaukee, WI. (Assignee).
L. Ewing, and M. J. Bykowski.
U.S. Patent No 4,198,299, 23 p, 18 Fig, 1 Tab, 4 Ref; Official Gazette of the United States Patent Office, Vol 993, No 3, p 985-986, April 15, 1980

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Separation techniques, Equipment, Vapor pressure, Suspended solids, Flow rates, Gas pressure, *Microscreening.

A limited differential gas pressure is applied across an unsubmerged portion of the screening cloth of a microscreen unit, while rotating the drum, screening and backflushing. Thus, the invention is distinguishable from pressure filtering techniques in which pressure is applied against the submerged area of a filter by pressurizing a confined body of liquid against a filter cake. The invention provides advanced methods and apparatus which are of particular interest for dealing with agglomerated solids. These involve: applying the differential pressure only during periods of peak load on the microscreen, and/or boosting shower pressure during at least a substantial portion of the time during which the differential pressure is being applied and/or off-setting, inhibiting or preventing the application of the applied differential pressure in the zone above the collection means. Drop-back of solids into the drum pool is reduced and the invention enables operation at increased flow capacity. (Sinha-OEIS)
W81-01455

SYSTEM AND APPARATUS FOR CONTROL AND OPTIMIZATION OF FILTRATION PROCESS,
Enviro Development Co., Inc., Mountain View, CA. (Assignee).
M. M. Zuckerman, and L. C. Hamer.
U.S. Patent No 4,198,298, 9 p, 2 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 993, No 3, p 985, April 15, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Control systems, Sludge, Flow control, *Filtration, Monitoring, Regulation, Equipment.

A process control apparatus and system for dewatering a solids ladened slurry of water and waste water employs one or more of four primary process control techniques, depending upon the particular process application. The four process control techniques are: (1) monitoring of the instantaneous solids concentration increase in the dewatering unit, (2) measurement of the rate of change of the solids concentration increase with respect to time, (3) controlled pumping to produce a substantially constant flow rate in the effluent from the dewatering unit until the terminal dewatering pressure is reached, and (4) variation of the amount of conditioning agents added to the influent slurry in response to one or more control signals derived from other components of the dewatering system and apparatus. (Sinha-OEIS)
W81-01456

REMOVAL OF TRACE COPPER IONS FROM WATER,
Office of the Secretary (Interior), Washington, DC. (Assignee)
E. Valdes-Krieg, J. King, and H. H. Sephton.
U.S. Patent No 4,198,297, 5 p, 1 Fig, 5 Ref; Official Gazette of the United States Patent Office, Vol 993, No 3, p 984-985, April 15, 1980.

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Industrial wastes, Metals, Separation techniques, Surfactants, Foam fractionation, Copper, Product recovery.

A method for separation and recovery of metal ions, particularly copper ions, from dilute aqueous solutions by means of a bubble fractionation process employs countercurrent contacting of the feed solution with a stream of gas bubbles and a surface-active agent. This is achieved by utilization of an elongated vertical fractionation column, with feed solution being continuously introduced near the top of the column, and the gas bubbles and surfactant being continuously introduced near the bottom of the column. Surfactant loading at the gas-liquid interface substantially throughout the length of the column is thereby obtained, resulting in improved separation of metal ions from solution in association with the surfactant. (Sinha-OEIS)
W81-01457

PROCESS FOR INCREASING THE EXCHANGE YIELD IN ION EXCHANGE PROCESSES.
Sandor Vajna (Germany, F.R.). (Assignee).
S. Vajna.
U.S. Patent No 4,198,295, 14 p, 7 Ref; Official Gazette of the United States Patent Office, Vol 993, No 3, p 984, April 15, 1980

Descriptors: *Patents, *Waste water treatment, *Desalination, Demineralization, Separation techniques, *Ion exchange, Industrial water, Product recovery, Regeneration.

A process is described for increasing the exchange yield in ion exchange processes. According to the invention, salt-containing waste waters are formed at two locations: with the commencement of the exchange reaction, the ion loss makes up about 2 to 10% of the ion content of the solution supplied from outside, and finally about 0.2 to 4%. These ions are once again found in the secondary waste water leaving the system. For the purpose of eliminating these ions, it is proposed to admix the dilute solutions obtained in addition to the product with the water which is to be treated, as a result of which its salt content increases about 3 to 15%. This causes a corresponding higher consumption of regenerating agent, but the result is thereby obtained that only the concentration is only slightly lower than that of the solution supplied from outside, and the treated water, which can be discarded or used again without any difficulties, emerge from the system. The process can be used not only in connection with treatment of waste water, but also in connection with the removal of salt from brackish water and in connection with the softening or demineralization of raw or untreated water. It is also possible to use the process for the production of chemical products. (Sinha-OEIS)
W81-01459

WATER PURIFICATION SYSTEM,
Redux Corp., Inc., St. Louis, MO. (Assignee).
T. N. Deane.
U.S. Patent No 4,198,294, 8 p, 2 Fig, 14 Ref; Official Gazette of the United States Patent Office, Vol 993, No 3, p 984, April 15, 1980

Descriptors: *Patents, *Waste water treatment, *Water pollution treatment, *Separation techniques, Industrial wastes, Water reuse, Emulsions, Surfactants, Foam separation, Detergents, *Water purification, Laundry industry

Waste water from a washing operation is reclaimed for re-use by emulsifing with a water insoluble (or oil soluble), high molecular weight, anionic surface active oil, then breaking the emulsion by physical or chemical methods, thereby producing a coherent floc which occludes insoluble matter suspended in the water, then separating the floc from the purified water in a coherent mass. WASTE WATER TREATMENT IN THE MEDITERRANEAN ZONE: STUDY OF VARIOUS SOLUTIONS USED ON THE FRENCH COAST. (PROBLEMES POSES PAR L'EPURATION DES EAUX RESIDUAIRES URBAINES EN ZONE MEDITERRANEENNE -- ETUDE DE DIVERSES SOLUTIONS APPLIQUEES SUR LA COTE FRANCAISE.),
Societe, Rueil-Malmaison (France). Dept. de Recherches Biologiques.
J. Bebin, and J-C. Jacquart.
Progress in Water Technology, Vol 12, No 1, p 403-417, 1980. 4 Fig, 1 Tab, 9 Ref.

Descriptors: *Municipal wastes, *Tertiary treatment, *Sewage treatment, Planning, Regulation, Cities, Tourism, Facilities, Mediterranean, *France.

Several waste water treatment plants on the Mediterranean coast of France are described which utilize various methods to meet French regulations. Physical-chemical treatment has been successful at Cannes and at other sites where available land is limited due to development and tourism. Where fluctuating population levels are a problem, a combination of physical-chemical treatment under peak loading conditions with biological treatment at low or medium loadings is suggested. Advanced treatment may be required in some cases. There is a pilot plant at Montpellier which disinfects thoroughly treated effluent, and in Nice-Lingostiere, advanced tertiary treatment is necessary. Thus, treatment solutions can be found for all areas in spite of problems posed by tourism, geographic location, and socio-economic conditions. (Small-FRC)

EFFECT OF CARBON, AMMONIA NITROGEN AND HYDRAULIC LOADING RATES, RPM, AND EXPOSED SURFACE AREA VARIATIONS ON RBC PERFORMANCE,
Connecticut Univ., Storrs. Dept. of Civil Engineering.
G. E. Hoag, and W. H. Hovey.
In: First National Symposium on Rotating Biological Contactor Technology Proceedings, June, 1980, p 103-117. 9 Tab, Army Construction Engineering Research Laboratory, P.O. Box 4005, Champaign, Ill. OWRT A-081-CONN(1), 14-34-0001-0107.

Descriptors: *Rotating biological contactor, Biological waste treatment, Factorial analyses, Effects of process variation, *Waste water treatment, Performance, Limiting factors, Effects, Carbon, Ammonia nitrogen, Hydraulic loading rates.

Basic and independent factors which possibly effect rotating biological contactor (RBC) effluent quality and performance are hydraulic flow rate, carbon mass flow rate, ammonia nitrogen mass flow rate, percent of disc area exposed to the atmosphere at any given time, and disc revolutions per minute (RPM). These factors were studied in this experimental program. Influent concentrations were not chosen as variables for study because they are not basic factors, but are derived factors, equal to mass flow rates divided by hydraulic flow rates.

MICROFAUNA AND RBC PERFORMANCE: LABORATORY AND FULL SCALE SYSTEMS,
Connecticut Univ., Storrs. Dept. of Civil Engineering.
G. E. Hoag, W. J. Widmer, and W. H. Hovey.
In: First National Symposium on Rotating Biological Contactor Technology Proceedings, June, 1980, p 167-187. 4 Fig, 8 Tab. Army Construction Engineering Research Laboratory, P.O. Box 4005, Champaign, Ill. OWRT A-081-CONN(2), 14-34-0001-0107.

Descriptors: Biological wastewater treatment, Protozoa, *Rotating biological contactor, Microbial ecology, *Waste water treatment, *Biological treatment, Bacteria, Ecology, Ecosystems, *Microfauna.

The transformation of soluble substrate to cells, metabolic products and excreta is the basis of the rotating biological contactor process. Metabolic activities associated with the rotating biological contactor occur in fixed-film, or as they are more commonly termed, biofilm cultures. Bacterial populations exist as a response to combinations of various environmental factors. The sum of all these factors constitute, in an ecological sense, a niche, or a specialized environment suitable for microbial occupation. These saprophytic bacteria are in turn predated by holozoic organisms such as the Phyla: Protozoa, Rotifera and Nematomorpha. Some members of these Phyla may prey upon either bacteria, algae or other members of the above mentioned Phyla. Thus, the niches for these organisms are defined by the presence of other organisms as well as environmental factors.

EFFECT OF PRETREATMENT ON THE FILTRATION OF LOW TURBIDITY SECONDARY EFFLUENT,
Los Angeles County Sanitation Districts, Whittier, CA.
L. S. Directo, C. Chen, and R. P. Miele.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-111031, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-148, August, 1980. 85 p, 29 Fig, 11 Tab, 13 Ref. 14-12-150.

Descriptors: *Waste water treatment, *Coagulation, *Filtration, *Suspended solids, *Turbidity, Waste water(Pollution), Costs, Activated sludge, Chemical precipitation, Sewage treatment, Filters, Polymers, Alum.

Removal of residual suspended solids after biological treatment is one of the proven procedures for upgrading waste water treatment plant performance. A 17-month pilot plant study evaluated the relative effectiveness of two types of pretreatment scheme on the performance of multimedia pressure filters in the removal of turbidity, suspended solids, and other associated pollutants from an activated sludge plant effluent. The two types of filter pretreatment schemes studied were a conventional chemical coagulation-sedimentation system and an in-line coagulation system. In both pretreatment schemes, alum and polymer were used. The turbidity removal performance was essentially the same for both dual media and mixed media pressure filters, but the headloss levels across the mixed-media filter were consistently higher than those observed in the dual media filter. The study demonstrated that for a low turbidity secondary effluent, an in-line coagulation pretreatment is feasible and results in significantly lower overall capital and operating costs than that of a conventional pretreatment system. Moreover, it was observed from limited filtration data that without chemical addition, the resulting filter effluent turbidity levels were comparable to those obtained in filters with an in-line coagulation pretreatment system operated at optimum doses of alum and polymer. The lengths of filter run with an in-line coagulation pretreatment were consistently shorter than those observed without chemical addition or with a chemical coagulation-sedimentation pretreatment. SUMMARY OF LONG-TERM RAPID INFILTRATION SYSTEM STUDIES.
Robert S. Kerr Environmental research Lab., Ada, OK.
L. E. Leach, C. G. Enfield, and C. C. Harlin, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB80-222086, Price codes: A04 in paper copy, A01 in microfiche Environmental Protection Agency Report EPA-600/2-80-165, July, 1980. 59 p, 7 Fig, 12 Tab, 12 Ref.

Descriptors: *Waste water treatment, *Municipal wastes, *Infiltration, Water pollution, Metals, Iron, Phosphorus, Groundwater, Pesticides, Lindane, Environmental sanitation, Rapid infiltration systems.

Evaluation of four long-term rapid infiltration municipal waste water systems indicates that they are generally operating in conformance with current criteria published in the Process Design Manual for Land Tretment of Municipal Waste waters as well as the proposed design rationale. Two of the systems were applying primary pretreated waste water to infiltration beds and two were applying secondary pretreated waste water. Comparison of treatment efficiency of infiltration beds indicated a higher percentage of removal for selected parameters in the systems with primary pretreatment. Lake George, New York, and Hollister, California, demonstrated exceptional capability for nitrogen removal through the soil treatment systems. Both of these systems were managed using well scheduled wetting and drying cycles. Phosphorus concentration was reduced at each of the treatment sites. Iron appears to be leaching from the profile at all sites, possibly due to reducing conditions developed during flooding cycles. Generally the other metals did not indicate significant differences in concentration between the waste water applied and that reaching the shallow groundwater. The pesticides that were detected in the waste waters were all found in the shallow groundwater, indicating these pesticides are mobile in the soil profile. Lindane was the only pesticide found significantly elevated over background groundwater concentrations. (Moore-SRC)

HUMIC SUBSTANCES REMOVAL BY ACTIVATED CARBON,
Illinois Univ., Urbana-Champaign. Dept. of Civil Engineering.
M. C-Y. Lee, and V. L. Snoeyink.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-163552, Price codes: A07 in paper copy, A01 in microfiche. Water Resources Center, University of Illinois, Research Report 153, November, 1980. 125 p, 43 Fig, 12 Tab, 52 Ref. OWRT-B-110-ILL(1), 14-34-0001-8083.

Descriptors: *Activated carbon, *Adsorption, *Water treatment, *Environmental engineering, *Humus, Organic compounds, Fulvic acids, Humic acids, Chloroform, Haloforms, Coagulation-sedimentation.

Humic substances are a major concern to the water treatment industry because they can cause odor and color problems and are potentially toxic and/or carcinogenic. A humic acid and a fulvic acid were used to evaluate the removal of humic substances by various activated carbons. Different analytical methods were investigated to measure the concentration of humic substances and their chloroform potential. Total organic carbon measurement and ultraviolet/visible adsorbance correlate well with the chloroform potential of humic substances. Pore size distribution was the most important physical characteristic of activated carbon for adsorption of humic substances. A decrease of pH in solution, lower molecular weight fractions of humic substances, smaller carbon particles, and the presence of soluble alum were found to increase carbon adsorption. Chemical pretreatment with alum increased the adsorption capacity of carbon almost three-fold. The application of a mathematical model to predict the performance of the carbon bed for the adsorption of humic substances was successful. In general, this model is sensitive to values of adsorption capacity of activated carbon and the surface coefficient of humic substances inside the adsorbent particle. The higher the adsorption capacity, the lower the diffusion coefficient. Based on the model predictions, the empty bed contact time of the carbon bed and the influent concentration were the two most important factors in designing a carbon bed for humic substance removal.

THE REMOVAL OF LOW LEVELS OF PHENOL BY ACTIVATED CARBON IN THE PRESENCE OF BIOLOGICAL ACTIVITY,
Illinois Univ. at Urbana-Champaign. Dept. of Civil Engineering.
W. A. Chudyk, and V. L. Snoeyink.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-163560, Price codes: A06 in paper copy, A01 in microfiche. Water Resources Center, University of Illinois, Research Report No 154, January, 1981, 110 p, 22 Fig, 9 Tab, 94 Ref. OWRT-B-110-ILL(2), 14-34-0001-8083.

Descriptors: *Water treatment, *Phenols, *Activated carbon, *Biological treatment, Potable water, Biological oxidation of phenol, Phenol removal, Waste water purification, Water reuse.

Bioregeneration of activated carbon was shown to occur in bench-scale carbon columns through use of parallel bacterially seeded and non-seeded, non-bioactive columns. Phenol degrading organisms were taken from an enrichment using phenol as sole carbon source. Mass balance calculations on phenol and dissolved oxygen were used to estimate

amounts of pre-adsorbed phenol being biodegraded under different conditions, with a check made on this amount through the use of adsorption isotherm analysis. The amount of bioregeneration was found to be related to the influent dissolved oxygen concentration. Transient organic load experiments showed that the presence of a bacterial population could affect the effluent concentrations resulting from such transient loadings primarily through two mechanisms: increased carbon capacity due to bioregeneration, and reduction of solution concentration due to biodegradation of phenol in the bulk solution. End product analysis was performed via carbon extraction, gas chromatography, and mass spectroscopy. Total organic carbon analysis of column effluents was also performed.

FEASIBILITY OF PURIFICATION AND CONCENTRATION OF SELECTED WASTE WATER STREAMS BY ULTRAFILTRATION,
Mississippi State Univ., Mississippi State. Dept. of Chemical Engineering.
N. Espinoza.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-163610, Price codes: A05 in paper copy, A01 in microfiche. MS Thesis, August, 1980. 68 p, 13 Fig, 24 Tab, 37 Ref. OWRT-A-130-MISS(2), 14-34-0001-0126.

Descriptors: *Waste water treatment, *Filtration, *Organic wastes, *Ultrafiltration, Waste water purification, *Pulp and paper industry, Concentration of waste water, High molecular weight organic wastes, COD, Wood sugars, Membrane processes, Cheese whey, Prehydrolysate, Amicon ultrafiltration unit.

Waste water streams in pulp and paper mills, hardboard plants and cheese whey processing plants often contain significant amounts of high molecular weight organic matter which place a heavy load on the waste water treatment facilities. The purpose of this work was to determine, on a lab scale, the feasibility of using ultrafiltration (UF) to purify and concentrate these wastes. The chemical oxygen demand (COD) reduction of the cheese whey, prehydrolysate and wood sugars permeates ranged from 92 to 97% of the initial values. The initial COD values of 60,000 ppm, 130,000 ppm and 119,000 ppm were reduced to less than 2,000 ppm, 6,000 ppm and 9,000 ppm, respectively. Ultrafiltration was found to be an effective process for purification and concentration of waste water streams. Because of its conceptual simplicity and low energy consumption, the UF membrane process offers an economically attractive solution for treating waste from pulp and paper mills, hardboard plants, and cheese processing plants.

WASTE WATER DISINFECTION - TOWARD A RATIONAL POLICY,
Johns Hopkins Univ., Baltimore, MD. School of Hygiene and Public Health.
K. Kawata, V. P. Olivieri, and C. W. Kruse.
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 416-420, February, 1980. 1 Fig, 1 Tab, 8 Ref.

Descriptors: *Water treatment, *Disinfection, *Salmonella, Water quality control, Water purification, Environmental engineering, Chlorination, Environmental sanitation, Public health, *Waste water treatment, Maryland, Baltimore(MD), Black River Treatment Plant(MD).

A study was made of Salmonella and the traditional indicator organisms in the raw waste water and in the chlorinated and unchlorinated plant effluents of the Black River Waste water Treatment Plant of Baltimore City. Waste water samples were held for 14 days and assayed at time intervals to establish the survival patterns of the organisms, in order to supply a reasonable data base for microbial load to downstream water uses. The findings demonstrated that Salmonella may be discharged to receiving waters if the effluent from a conventional waste water treatment plant is not disinfected. This fact, coupled with data demonstrating that underestimation of the concentration of Salmonella is likely to occur, plus the knowledge that techniques for monitoring many pathogens still are being developed, suggests that prudence and caution be exercised and that all plant effluents be disinfected. Exceptions would be only on a case-by-case basis, where it can be shown that the health of the public is not threatened. (Baker-FRC)

WATER RESOURCES FOR CHICAGO-HISTORY AND FUTURE,
Metropolitan Sanitary District of Greater Chicago, Chicago, IL.
F. C. Neil, and F. E. Dalton.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 173-184, March, 1980. 5 Fig, 1 Tab, 2 Ref.

Descriptors: *Waste water treatment, *Storm drains, *Chicago, Reviews, Water pollution, Sewage treatment, Tertiary treatment, Lake Michigan, Storm runoff, Tunnels, Treatment facilities, Sanitary engineering, Public health, Future planning, Aeration, Municipal wastes, Water management, Cities, Chicago River.

A review of Chicago's management of its water resources is presented, with emphasis on measures taken to handle a rapidly increasing population. The Sanitary District of Chicago has increased from its original 409 sq km to 2,243 sq km. When the US Supreme Court declared in 1930 that Illinois was taking more than its share of water from Lake Michigan, Chicago began expansion of its sewage treatment program. Previous attempts to control public health problems from sewage included the reversal of the Chicago and Calumet Rivers away from this Great Lake. The history of pollution problems in the city is reviewed from the time of the city's settlement in the 17th century to the present. The main source of pollution of the Chicago River and Lake Michigan was from untreated sewage discharged from the city. The Metropolitan Sanitary District of Greater Chicago now has 3 major secondary treatment plants and maintains rigid controls over private and industrial treatment systems. Often, low flow rates in the District's waterways cause serious decreases in the levels of dissolved oxygen. Storm runoff usually overloads the sewage systems, and the overflow into the two rivers must be released into Lake Michigan. Pollution of the lake often forces the recreational beaches to close. A ten year plan to improve water quality in the Sanitary District includes building instream aeration systems, upgrading major sewage treatment plants to tertiary treatment, and furnishing an extensive tunnel and reservoir system to handle storm overflows. Attempts will also be made to eliminate backflows to Lake Michigan, which will prevent pollution of this water body by the city. (Geiger-FRC)

DECLINING-RATE VERSUS CONSTANT-RATE FILTRATION,
Sao Paulo Univ. (Brazil). Dept. of Hydrology and Sanitation.
L. Di Bernardo, and J. L. Cleasby.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 106, No EE6, p 1023-1041, December, 1980. 11 Fig, 3 Tab, 13 Ref.

Descriptors: *Filtration, *Flow rates, Performance, *Water treatment, Waste water treatment, Turbidity, On-site investigations, Equipment, Flow profiles, Declining rate filtration, Backwash, Pressure head.

The advantages of a declining rate system were demonstrated when declining rate filtration was compared to constant rate filtration at three filtration rates: 3 gal/min/sq ft, 5 gal/min/sq ft, and 7 gal/min/sq ft. The declining rate system produced an average filtrate turbidity which was consistently and substantially better than that of the constant rate system. The declining rate system produced 30-60% lower average filtrate turbidity. The poorest effluent quality of the declining rate system occurred after backwashing one filter, and the highest filtration rate occurred on the cleanest filter remaining in service during the backwashing operation when water reached its maximum level. The filtration rates in the individual filters of the declining rate system remained constant between backwashings and declined in a stepwise fashion after each backwash. (Small-FRC)

ROTATING-DISC BIOLOGICAL TREATMENT OF ACID MINE DRAINAGE,
Tennessee Valley Authority, Chattanooga.
H. Olem, and R. F. Unz.
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 257-269, February, 1980. 10 Fig, 6 Tab, 17 Ref.

Descriptors: *Acid mine water, *Mine drainage, *Biocontrol, Acidic water, Mine water, Water types, Acid streams, Mine wastes, Biological treatment, Water treatment, *Waste water treatment.

The study was conducted to determine whether naturally occurring bacteria in acid mine drainage (AMD) would effectively and efficiently oxidize Fe2+. Specific objectives of the study included the treatment of AMD of contrasting physical, chemical and microbiological characteristics; a comparative performance evaluation of different size rotating biological contactor (RBC) units for determining potential scale-up problems in design and operation of the process; and requirements for treating specific drainages and necessary modifications to accomplish desired effluent quality. Under all conditions tested the continuous microbiological oxidation of Fe2+ to less soluble Fe3+ was accomplished. Mine-water temperatures as low as 0.4 degrees C reduced but did not stop Fe2+ oxidation in field RBC units. The 0.5 m RBC unit produced an average of 10% higher Fe2+ oxidation efficiency than the 2.0 m unit. No relation was noted between Fe2+ oxidation efficiency and influent pH over the pH range of 2.18 to 5.50. Lower influent Fe2+ in Hollywood mine drainage (71.6 mg/l) resulted in a higher oxidation efficiency at equilibrium for the 2.0 m prototype RBC (95.7%) as compared with the treatment efficiency when mine water contained about twice the influent Fe2+ content (90.5%). Under similar operating conditions, Fe2+ oxidation efficiencies in the treatment of Hawk Run mine waters with the RBC field units were 10 to 15% lower than treatment efficiencies observed with Hollywood mine drainage, which may be due to differences in the nature of disc solids. START-UP PROBLEMS AT A PLANT TREATING FOOD-PROCESSING WASTEWATER,
Metcalf and Eddy, Inc., Boston, MA.
E. L. Stover.
Journal of the Water Pollution Control Federation, Vol 52, No 2, p 249-256, February, 1980. 5 Fig, 6 Ref.

Descriptors: *Food processing industry, *Waste water treatment, Industries, *Industrial wastes, Pollutants, Activated sludge, Operations, Carbohydrates, Slime.

Operational difficulties associated with the start-up of an industrial wastewater pretreatment plant treating a highly variable carbohydrate wastewater by the complete-mix activated sludge process are described. The operation consists of wastewater neutralization, two dissolved air flotation units, a complete-mix equalization basin, a complete-mix aeration basin, a final clarifier, and an aerobic digester. The system functions as a two-stage system, with the equalization basin also serving as the first stage of biological treatment. High point in both wastewater flow and organic load correspond

to cleanup operations at the end of the production week. Two major problems caused by the organic shock loading conditions were encountered during the start-up of the plant. The fluctuations in wastewater flow rate did not present operational problems, as these changes could be handled by the equalization basin while a constant flow to the aeration basin was maintained. During nitrogen-deficient conditions in the equalization basin caused by doubling of the organic loading, bacterial cell replication was retarded, and the bacteria capable of producing extracellular polysaccharide began producing large amounts of polysaccharide slime. The equalization basin was reseeded with biological sludge from the aeration basin and with domestic treatment plant sludge to reduce the slime biologically. (Baker-FRC)

SELECTED ORGANIC PESTICIDES, OCCURRENCE, TRANSFORMATION, AND REMOVAL FROM DOMESTIC WASTEWATER,
North Texas State Univ., Denton.
F. Y. Saleh, G. F. Lee, and H. W. Wolf.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 19-28, January, 1980. 3 Fig, 7 Tab, 16 Ref.

Descriptors: *Waste water treatment, *Chlorophenoxy herbicides, *Pesticides, Chlorinated hydrocarbon pesticides, Activated carbon, Aldrin, 2,4-D, Dieldrin, DDT, Water pollution, Domestic water, Domestic wastes.

Results are presented of a study on the occurrence, transformation, and removal of chlorinated hydrocarbon pesticides (CHP) and chlorophenoxy herbicides (CPH) from Dallas, Texas municipal wastewater. The pilot plant used in the study includes two completely mixed activated sludge units (aeration basins and final clarifiers), a chemical treatment module, two mixed-media filters, and two activated carbon columns. Throughout the study period, electron capture gas chromatography of the wastewater demonstrated the resolution of 20 to 25 peaks having relative retention time (Rr) values less than 1.3. Only minor changes were noted in the number of peaks during the study period. The finding of the same characteristic fingerprints in higher magnitude in extracts of raw and treated wastewater indicates the refactory nature of the organic pesticide and herbicide residues and indicates that each area has a profile characteristic of the activities which infiltrate the system. Confirmation in wastewater was attained for aldrin, dieldrin, o,p'-DDT, p,p'-DDT, 2,4-D alkyl esters, and inorganic salts of 2,4-D. The chlorinated hydrocarbons aldrin, dieldrin, and DDT compounds represent only a minor fraction of the CHP residues. The major part was the 2,4-D compounds, which are commonly used in lawn and aquatic weed control. The results of the study indicate that activated sludge treatment of wastewater under nitrifying conditions effected only limited removal of these organic residues as detected on EC chromatograms. HYDRAULIC CONSIDERATIONS IN DECLINING-RATE FILTRATION.
Iowa State Univ., Ames.
J. L. Cleasby, and L. Di Bernardo.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 106, No EE6, p 1043-1055, December, 1980. 4 Fig, 7 Ref.

Descriptors: *Filtration, *Flow rates, Turbidity, Filters, Equipment, Head loss, Flow profiles, Water treatment, *Waste water treatment, Declining rate filtration, Pressure head.

The six most common hydraulic questions are answered for declining rate filtration systems. Declining rate filtration can be used as a flow system for granular bed gravity filters in water and waste water treatment plants. Head loss for the system is the sum of the clean filter head loss when the filters have dropped to level 2 after the backwash of one filter, plus the rise in level which occurs between backwashes from level 2 to level 3, and the rise in level which occurs during the backwash of one filter. Excessive rates of filtration through a clean filter are prevented by a flow restricting orifice or a fixed position valve. Predicted water level variations are presented, and the effect of turbulent head loss on filter operation is discussed. A declining rate system can operate with low turbulent head loss if the maximum water level is limited to avoid excessive rates on a clean filter Declining rate can be operated under varying plant load by washing filters at various times throughout the day. Full understanding of the declining rate system should make it more common. (Small-FRC)

EFFECTIVENESS OF LAND APPLICATION FOR PHOSPHORUS REMOVAL FROM MUNICIPAL WASTE WATER AT MANTECA, CALIFORNIA,
Cold Regions Research and Engineering Lab., Hanover, NH
I. K. Iskandar, and J. K. Syers.
Journal of Environmental Quality, Vol 9, No 4, p 616-621, October/December, 1980. 4 Fig, 4 Tab, 18 Ref.

Descriptors: *Waste water treatment, *Sorption, Soil treatment, Soil filters, Soil disposal fields, Phosphorus, Municipal wastes, *Phosphorus removal.

The effectiveness of removal of dissolved inorganic phosphate (DIP) from municipal waste water by slow infiltration systems such as the one at Manteca, California, is evaluated. The design flow rate at the sewage treatment plant is 9.5 million liters/day. When necessary, waste water is stored in a holding pond. Perennial ryegrass makes up the major vegetation of the area. Most of the waste water applied at the site infiltrates to the ground water table. While ground water flows in a southwesterly direction toward a river, it is likely that a substantial portion of the water is intercepted by a major drainage ditch that bounds the north, west, and south sides of the disposal area. Three sets of monitoring wells were installed during the initial construction. Samples were collected in June, September, and November of 1974 and again in February, May and July of 1977. DIP concentrations in soils that had received municipal wastewater for 4 and 13 yr ranged form 7.3 to 13.9 micrograms P/ml. The ability of the soil to remove added P was low. Only a small portion of the total P accumulated from waste water addition was in the organic form. Calcium chloride was able to remove large amounts of P from the upper 45 cm of the profiles receiving waste water. The very low P sorption capacity of the soil is regarded as the major factor for the poor performance of the Manteca system in terms of P removal from waste water. (Baker-FRC)

SEWER RENOVATION--SOLUTIONS FOR THE 80'S.
Water Services, Vol 84, No 1016, p 625-626, October, 1980. 1 Fig, 2 Tab.

Descriptors: *Insituform process, *Linings, *Sewers, *Pipes, *Rehabilitation, Costs, Repairing, Construction costs, Conveyance structures, Cost comparisons, Manholes, Comparative costs, Sewage disposal, District of Columbia, Dublin.

The most economical methods of renovating sewer systems involve relining existing pipes. After asbestos cement sewer pipes in a Dublin housing development were discovered not in compliance with local standards, the Insituform process was chosen to reline existing pipes and eliminate groundwater infiltration. The process used flexible, strong, and chemically inert pipe lining installed in sections and grouted in place. Although the inside diameter of the pipe was reduced by 12 mm, flow characteristics were improved by the smooth lining. Total costs of inspection, relining, etc. were 9,423 pounds compared with the estimated 25,000 pounds for reexcavating and replacing the defective system. Comparable work done in Washington, D. C., showed that pipes from 150 to 600 mm diameter were installed for about 50% of costs necessary to dig up and replace old pipes. (Cassar-FRC)

FLOW SPLITTING CONTROL,
A. M. Crossley.
Water Services, Vol 84, No 1016, p 608, 610, October, 1980. 3 Fig

Descriptors: *Flow control, *Instrumentation, *Control systems, *Flow splitting, *Waste water treatment, Activated sludge, Flow measurement, Penstocks, Flowmeters, Remote control, Gradually varied flow, Inflow, Flow separation

Flow splitting in a waste water treatment plant is an attempt to distribute the incoming flow equally to each treatment lane, even if the total flow varies. This differs from flow balancing, which attempts to maintain a constant flow to treatment throughout the day. Design of flow splitting equipment should consider flow measurement, flow control, flow-loop control, and flow splitting control If traditional flowmeters are not suitable, there is an experimental device consisting of a Doppler sensor head and an ultrasonic level meter. Penstocks used in flow control may be modified by adding a remote actuator. Proper design of flow splitting control systems is based on diverting flow into appropriate channels rather than restraining it from channels. Although flow into the primary treatment plant is considered in this paper, the possibility of use in return of activated sludge is mentioned. (Cassar-FRC)

COST-EFFICIENT DESIGN SOLVES TOWN'S PROBLEM.
Camp, Dresser and McKee, Walnut Creek, CA
S. Goodman, and D. Trumball
Water and Wastes Engineering, Vol 17, No 11, p 31-35, 50, 51, November, 1980. 2 Fig, 3 Tab.

Descriptors: *Industrial wastes, *Municipal wastes, *Sludge treatment, Rotational flow, Inflow, Waste water treatment, Effluents, Sewage effluents, Primary treatment, Secondary treatment, Sewers, Drainage systems, Water quality control, Design, Infiltration, Crescent City(CA), California, Food processing industry.

A cost-efficient design for sewage system improvements in Crescent City, California, is described The design addressed the problems of an overloaded primary treatment plant, an aging sewer system, a central urban location, waste discharge standards, and accommodation of nuisance wastes from seafood industries. The design consisted of a three-pronged plan, cost-effective in both capital outlays and continuing expense. An on-site pre treatment plan was developed for seafood wastes, which included hauling screened wastes to a landfill. Correction and repair of storm inflow sources accompanied by a surveillance program eliminated infiltration/inflow. The existing primary treatment facility was upgraded and expanded to include a secondary treatment process using rotating biological contactors and a two-stage sludge digester This system has the benefits of simple operation, low power consumption, minimal maintenance requirements, good sludge settleability, potential for nitrification, control of odors, and the ability to handle shock loads and high industrial loads. WETLANDS IRRIGATION AIDS MAN AND NATURE.
T. C. Williams
Water and Wastes Engineering, Vol 17, No 11, p 28-31, November, 1980. 2 Fig.

Descriptors: *Irrigation design, *Wetlands, *Marshes, Pilot plants, *Michigan, Operation and maintenance, Irrigation practices, Irrigation engineering, *Waste water treatment, Freshwater marshes, Wildlife, Game birds, Construction costs.

Two wetlands in Michigan, one natural and one artificial, are successfully used for irrigation of

treated effluent from waste water treatment facilities. During a 4 to 6 month irrigation season, an average of 85 million gallons per day of effluent containing 4 milligrams per liter of phosphorus, 0.6 milligrams per liter of ammonia and 5.4 milligrams per liter of nitrate nitrogen results in a high level of treatment. The wetlands require little or no maintenance, less isolation than spray irrigation areas, and have lower manpower and energy costs than conventional systems. This system has potential application for strip mines and other barren lands or areas lacking viable marsh habitat for recreational game. (Titus-FRC)
W81-01574

POLLUTION SOLUTIONS--THE CATIOPHORETIC PAINT INDUSTRY.
Effluent and Water Treatment Journal, Vol 20, No 10, p 506-507, October, 1980. 2 Fig.

Descriptors: *Paints, *Industrial wastes, *Froth flotation, *Water pollution treatment, Lead, Protective coatings, Coatings, Sewage treatment, Waste water treatment, Flotation, Flocculation, Coagulation, Foaming, Sludge, Separation techniques.

Catiophoretic paints used for electrocoating car and appliance bodies have a density near that of water, making sedimentation of the waste waters impractical. A flotation process has been developed which combines liquid-solid-gas phases in variable proportions. After coagulation and flocculation of the paint-contaminated water, air is added to the system by mixing with water previously saturated with air under pressure, producing microbubbles, 20-80 micrometers in diameter, upon controlled depressurization. These bubbles carry the particles to the surface, where they form a flocculated sludge. Treated effluent contained less than 3 mg per liter soluble lead, reduced from 250 mg per liter, and less than 100 mg per liter suspended solids. If paint concentration exceeds 1,500 mg per liter, prior dilution may be necessary. Sodium carbonate is used to raise the pH to prevent polymerization of the particles at the point of injection. PERFORMANCE OF SOME OIL DISPERSANTS ON OIL SLICKS OF VARYING THICKNESS,
British Petroleum Co. Ltd., Sunbury-on-Thames (England).
D. G. Meeks.
Marine Pollution Bulletin, Vol 11, No 12, p 348-352, December, 1980. 6 Fig, 3 Tab, 1 Ref.

Descriptors: *Oil pollution, *Dispersion, *Water pollution treatment, *Emulsifiers, Ultimate disposal, Disposal, Biodegradation, Sea water, Laboratory tests, Water pollution sources, *Oil spills, Oil dispersants, Emulsions.

Effects of oil dispersants were studied on 50 g samples of a fuel oil-kerosine mixture in a laboratory apparatus based on a Perspex tank with agitation. This tank is similar in size to a household aquarium. The purpose of the study was to explore the possibilities of the method and to relate this work to the original method and to other laboratory testing procedures within the industry. Commerical dispersants such as BP 1100WD performed well. A 5-10 minute static soaking time using the dispersant as a 10% emulsion yielded low efficiencies. A soak time of at least 5 minutes improved effectiveness of BP 1100X. Doubling the film thickness (from 5 mm to about 10 mm) dropped the dispersing efficiency of BP 1100X on heavier oils to a level unlikely to be effective in real spill situations. However, the kerosine-fuel oil mixture dispersed even at a 12 mm thickness. Increasing the amount of dispersant applied to a slick increased performance. Possible procedures for practical spill situations are injection or booming and flooding of the slick and ruptured tanks with solvent based dispersants or use of aircraft to apply undiluted dispersant. (Cassar-FRC)

FORMATION, PREVENTION AND BREAKING OF SEA WATER IN CRUDE OIL EMULSIONS 'CHOCOLATE MOUSSES',
Shell Research B. V., Amsterdam (Netherlands).
A. L. Bridie, Th. H. Wanders, W. Zegveld, and H. B. Van Der Heijde.
Marine Pollution Bulletin, Vol 11, No 12, p 343-348, December, 1980. 8 Tab, 3 Ref.

Descriptors: *Oil spills, *Emulsions, *Water pollution treatment, Oil pollution, Water pollution sources, Emulsifiers, Chocolate mousses, Waste water treatment, Transportation, Sea water, Ships, Mousses, Laboratory studies.

'Chocolate mousses,' brown, highly viscous, stable emulsions of about 70% sea water in oil, are a result of shipping accidents and other releases of crude petroleum at sea. An emulsifier, designated LA 1834, was successful in laboratory scale and field trials as a 'mousse-breaking' chemical. During salvage and cleanup following an explosion aboard the tanker, Irene's Serenade, off the Greek coast, addition of 200-400 g of the additive per 200 liter drum reduced the viscosity so that the material was easily loaded and unloaded into disposal trucks. On storage, the emulsion lost much of its water content. The formation and properties of mousses were studied by making sea water emulsions with several crude oils and fractions. Emulsions formed by fractions with initial boiling points of 200 C were stable at 20 C and lower; those made with fractions with initial boiling points of 275 C were stable at 30 C and lower. Experiments showed that paraffin wax and asphaltenes were responsible for the stability of mousses. (Cassar-FRC)

RELATIONSHIP BETWEEN PHOSPHATE STRESS, EFFLUENT QUALITY, AND OBSERVED CELL YIELD IN A PURE-OXYGEN ACTIVATED-SLUDGE PLANT,
Gent Univ. (Belgium). Lab. for General and Applied Microbial Ecology.
W. Verstraete, and W. Vissers.
Biotechnology and Bioengineering, Vol 22, No 12, p 2591-2606, December, 1980. 4 Fig, 5 Tab, 14 Ref.

Descriptors: *Phosphates, *Activated sludge, *Oxygenation, *Industrial wastes, *Waste water treatment, Phosphorus compounds, Waste treatment, Organic wastes, Effluents, Sludge digestion, Operating costs, *Belgium.

An industrial waste treatment plant at the BP Chemicals Belgium Works was tested under 3 conditions--nonstress, continuous phosphate stress, and discontinuous phosphate stress-to determine the effects of these factors on sludge production and effluent quality. The system, which has a 3,000 cu m per day capacity, used pure oxygen in an activated sludge process with pH adjustments and ammonia and phosphate additions. Best results were produced by the discontinuous phosphate stress condition, in which the minimum daily phosphate dose was provided in two stages, at the initial stage and during a 3 hour period later in the day. Cell yield coefficient and sludge production was 45% below normal, and total operating cost reduction was 24%. The high quality effluent produced had excellent settling properties. Although the continuous phosphate stress conditions reduced sludge production by 36%, effluent quality was not improved. (Cassar-FRC)

SEPARATION OF URANIUM FROM NATURAL WATERS ON CHELEX-100 RESIN,
Australian Atomic Energy Commission Research Establishment, Lucas Heights.
P. Pakalns.
Analytica Chimica Acta, Vol 120, p 289-296, November, 1980. 1 Fig, 2 Tab, 9 Ref.

Descriptors: *Uranium, *Water analysis, Sea water, Analytical techniques, Ion exchange, Separation techniques, *Water treatment, Separation techniques.

Uranium can be separated from fresh and saline waters on Chelex-100 resin by adjusting the pH of the sample to 4.0 after addition of 1,2-diaminocyclohexanetetraacetic acid. After elution with 2 M nitric acid, uranium is determined either by the spectrophotometric 4-(2-pyridylazo)-resorcinol method (preferable for high levels) or the fluorometric method (preferable for microgram per liter levels). Phosphate at 25 to 500 micrograms does not interfere if thorium nitrate is added before the resin separation step. Best uranium recovery (93%) is obtained when the resin column is maintained at pH of 4.6 by addition of sodium acetate, acetic acid buffer. Surfactants, sodium tripolyphosphate, and complexing agents reduce recoveries to 84-91%. Vanadium interferes with the spectrophotometric method, but not the fluorometric method. Uranium was concentrated on the resin without prior acidification and with and without the complexing step at a recovery rate of 90%. Levels obtained were 3.5 and 3.4 micrograms per liter. SEEKING A SOLUTION TO MULTIPLE SEWER PROBLEMS,
Wegman Engineers, New York.
G. R. Schevon.
Public Works, Vol 111, No 2, p 60-62, February, 1980. 3 Fig.

Descriptors: *Diversion tunnels, *Sewage treatment, *Interceptor sewers, Water pollution, *Waste water treatment, Tunnel design, Tunnel construction, Urban drainage, Storm runoff, Costs, Sewage effluents, Sanitary engineering, Model studies, Computer models, Sewage disposal, Environmental sanitation, *Buffalo(NY).

A study of the Buffalo Sewer Systems was initiated in 1970 to address the problems besetting the facilities serving 402,000 people. Raw sewage had been discharged into the Scajaquada Drain, the enclosed portion of Scajaquada Creek, for many years, causing pollution of the creek. A weir and an inlet grate structure were installed in the Drain to divert creek waters to an outfall sewer connected to the city's main interceptor. Water from sewage effluent discharged by Cheektowaga, Buffalo's upstream neighbor, was also intercepted by the treatment plant. Creek water also flowed into the Delaware Park Lake, a recreational lake downstream from the treatment plant, which had to be closed to the public in 1958 due to unsanitary conditions. Intrusion of waters from the Black Rock Canal and storm overflows also added to the treatment burden of the city's main plant. A Road Research Laboratory model, a computerized stormwater management model for highly urbanized areas, was applied to the problems of the Buffalo city sewage system. The master sewer plan which was developed recommended the transporting of raw sewage from Cheektowaga to Buffalo's new secondary treatment plant. It was also suggested that all sewage discharging into the Scajaquada Drain should be intercepted. To accomplish this, a tunnel interceptor was proposed which would carry sewage by gravity flow from the creek at the easterly city line to the Niagara Street interceptor at Squaw Island. The tunnel would be between 40-60 feet below the ground with a 9 foot diameter bore and a 9 inch concrete lining. Estimated costs of $34,750,000 would be covered by federal funding. Tunnel boring began in September of 1979 and completion of the project is anticipated early in 1981. (Geiger-FRC)

NO NONSENSE MANAGEMENT: KEY TO SUCCESSFUL WASTEWATER PLANT OPERATION,
Toledo, OH. Water Reclamation Div.
K. Keil, P. Munn, and H. Bhatt.
Public Works, Vol 112, No 1, p 61-64, January, 1981. 1 Fig.

Descriptors: *Activated sludge, *Administration, *Operation and maintenance, *Waste water treatment, Treatment facilities, Planning, Personnel, Performance, Municipal wastes, Industrial wastes, Ohio, *Toledo(OH).

Sound management techniques were used to improve the performance of the large waste water

treatment plant in Toledo, Ohio. Operation and maintenance costs were also reduced at the 100 mgd plant. The facility employs the activated sludge process and receives municipal wastes, storm water, and industrial wastes. A new commissioner of the division of water reclamation instituted a cost accounting system and a preventive maintenance program, made efforts to reduce chemical and energy consumption, began a training and safety program for division personnel, and let a new contract for sludge hauling and land spreading. These policies caused significant improvements over a period of two years. For example, four primary digesters were cleaned for the first time in ten years, resulting in a marked difference in digester operation. Also, to avoid breakdowns which had been common, the 10 primary and 11 secondary clarifiers are systematically cleaned and inspected twice a year. Operating costs were reduced in part by eliminating unnecessary personnel and controlling purchasing. (Small-FRC)

GAC WATER TREATMENT SYSTEMS,
Culp/Wesner/Culp, El Dorado Hills, CA.
R. L. Culp.
Public Works, Vol 111, No 2, p 83-87, February, 1980. 5 Fig, 1 Tab.

Descriptors: *Water treatment, *Operating costs, *Activated carbon, Pilot plants, Waste water treatment, Tertiary treatment, Potable water, Organoleptic properties, Color, Odor, Water treatment, Project planning, Organic compounds, Design data, Model studies, Safety factors, Taste, Public health.

Little design or cost data has been available on the granular activated carbon (GAC) treatment of public water supplies, a practice employed in approximately 46 cities of the United States for control of taste, odor, and color. Many of the problems encountered with GAC treatment have been mechanical. Five GAC performance studies are currently being sponsored by the EPA to yield GAC performance and cost data on reactivation at water supply installations. Twenty to thirty GAC plants for food processing will give insight to design and safety factors of the process and a similar number of facilities for industrial water pollution control will yield operation and cost data for this application of GAC systems. Pilot plant studies of GAC adsorptive and reactivation properties in municipal water treatment installations may be combined with known costs of GAC systems in waste water treatment to give design models and estimates of preliminary costs which are appropriate for developing new water treatment facilities. (Geiger-FRC)

BACTERIAL SUPPLEMENTATION AIDS WASTE WATER TREATMENT,
Arvada Public Works Dept., CO.
C. Gardner.
Public Works, Vol 111, No 3, p 71-72, March, 1980. 1 Tab.

Descriptors: *Waste water treatment, *Sewage bacteria, Lipids, Sludge digestion, Cultures, Odor, *Biological treatment, Industrial wastes, Biochemical oxygen demand, Colorado, Temperature, Trickling filters, Municipal wastes, *Arvada(CO).

Problems of grease digestion at the Arvada waste water treatment plant, Colorado, due to the destruction of bacterial action by industrial wastes were handled by a program of bacterial supplementation. Type A DBC Plus dried bacterial cultures were added along with wetting agents and buffers to plant influent after grit removal at rates of 14 pounds/day for 10 days, and afterwards additions were gradually decreased. Occasional industrial discharges of chromates have periodically halted the system, but the operations have been altered to recover these compounds. Since the new system has been in operation, effects of cold weather on BOD and suspended solids reduction have not been as severe, and odor has been reduced. Complete digestion of sludge has also helped to prevent some of the odor problems. After 9 months of operation, a line that used to clog continuously with grease due to restaurant wastes required no additional maintenance other than the supplemental bacterial treatment. The technique allows in-house management and regulation of environmental conditions affecting treatment processes. (Geiger-FRC)

URBAN AND AGRICULTURAL DEVELOPMENT: THE WASTE WATER ROLE,
B. Christopher.
Public Works, Vol 111, No 4, p 65-66, April, 1980.

Descriptors: *Water reuse, *Soil amendments, *Irrigation programs, Irrigation water, Imparied water use, Waste water treatment, *Reclaimed water, Colorado, Sludge disposal, Reservoirs, Water storage, Local governments, Federal government, Water resources development.

A water reuse program has been operating successfully in Westminster, Colorado, wherein secondary treatment plant effluents are used by farmers for irrigation water in exchange for their allotted amount of canal-supplied irrigation water which may have been reduced in periods of water shortages. The system, which has been in operation since 1977, utilizes the pumping of water from the treatment facility to the Farmer's High Line Canal two miles away. The city draws water from Standley Lake when it is needed without purchasing additional water rights. An expansion of the treatment plant scheduled to be completed in 1982 will provide the city with 3,000 acre feet of water annually. Pumping of potential irrigation water to the system will substantially reduce the costs that the city would have had to pay to purchase raw water. Local courts have addressed the parameters of the exchange system, and precedents will decide the ultimate potentials of the reuse program. A reservoir to store effluents generated in the winter is planned so that farmers may begin to use the supply for irrigation during spring planting in April and May. Liquid sludge has also been injected into cultivated farmland, eliminating all the sludge from the city's operation and avoiding the need for expensive landfilling. Higher yields of corn were reported from sludge amended plots, which were attributed to increased nutrients and mulching effects. Daily quality tests have been conducted by local farmers and city and state health officials. The cooperation of the city water treatment facilities with local farmers has received praise from all sectors of government. (Geiger-FRC)

CONTROLLING AMMONIA IN WASTE WATER EFFLUENTS,
Environmental Protection Agency, Chicago, IL.
D. H. Stoltenberg.
Public Works, Vol 111, No 2, p 72-73, February, 1980. 2 Fig, 2 Tab, 3 Ref.

Descriptors: *Ammonia, *Nitrification, *Activated sludge, Aeration, Biological treatment, Nitrate, Nitrite, Temperature, Hydrogen ion concentration, Dissolved oxygen, Biochemical oxygen demand, Organic compounds, Metals, Flocculation, Aerobic bacteria.

Ammonia nitrogen is undesirable in waste water treatment plant effluents due to its toxicity to fish, its high oxygen demand and its ability to combine with chlorine to form chloramines. The activated sludge process can biologically convert ammonia to nitrite and nitrate by nitrification. Favorable temperatures for nitrifying bacteria are in the range of 5-30 degrees, with more efficient processing occurring in the summer than in the winter. Dissolved oxygen conditions in aeration tanks should be maintained at 2.0 mg/liter or above, and the optimum pH for nitrification is 8.4 and should not fall below 7.0. To require nitrification, the ammonia nitrogen concentration of an influent waste water should be more than 1 mg/liter at all times. Toxic metals and organics may also interfere with the nitrification process. Conventional activated sludge processes are usually well suited to biological nitrification. Contact stabilization is generally not adequate for nitrification, because insufficient biological mass in the contact tank often produces incomplete removal of ammonia by the floc. (Geiger-FRC)

OPERATIONAL EXPERIENCE WITH AERATED LAGOONS,
Hawksley (Watson) Consulting Engineers, High Wycombe (England).
H. R. Oakley.
Progress in Water Technology, Vol 11, No 3, p 239-242, 1980. 2 Fig, 2 Tab.

Descriptors: *Aerated lagoons, *Sewage lagoons, *Operatings, Costs, On-site investigations, Performance, Baffles, Settling basins, Aeration, *Sewage treatment.

Operating experiences with two aerated lagoons with integral settlement zones are described. One, in the Middle East, treats settled sewage to a nitrified standard suitable for limited reuse applications. The second, in the Far East, treats crude sewage to a standard suitable for sea discharge. Initially some difficulties were experienced in obtaining adequate settlement in the settling zones, but this was corrected through modifications to the baffle. This form of treatment has low capital costs but high power consumption and high operating costs. Thus, these lagoons are most successful when used for short-term temporary works and should be of the simplest construction possible. The main process design parameters are presented. The initial operating results of the Middle Eastern lagoon included: effluent BOD 16 of mg/liter, effluent suspended solids of 21 mg/liter, and effluent NH3N of 1 mg/liter. (Small-FRC)

CONVENTIONAL BIOLOGICAL FILTERS AT ULTRA-HIGH LOADINGS AS MAIN PROCESS STAGE FOR A STRONG MIXED WASTE,
Ninham Shand, Inc., Cape Town (South Africa).
H. C. Blersch.
Progress in Water Technology, Vol 12, No 3, p 243-249, 1980. 3 Fig.

Descriptors: *Filtration, *Rocks, Biochemical oxygen demand, Filters, *Canneries, *Waste water treatment, Industrial wastes, Sedimentation, Aeration.

Very highly loaded two-stage stone media biological filters are part of a 35,000 cu m/day treatment plant treating waste which originates largely from fruit canneries. The biological filters have a diameter of 30.5 m and a depth of 2.7 m, and use rounded river pebbles as the filtering media. The waste piped from the industrial sites has a BOD of 1,200 to 1,400 mg/liter. Little increase in BOD removal is obtained at loadings exceeding 4 kg/cu m/day in these coarse media filters, but the filters will tolerate loadings exceeding 6.0 and will produce an effluent acceptable to fine media filters at such high loadings. The optimum ratio of primary to secondary filter volumes was approximately 1.0 : 1.1 for maximum combined removal capacity. With two-stage filters in this ratio, BOD removal will be 1.6 kg/cu m/day at loadings per cu m of combined media volume of 2.2 kg/day (70% removal). After evaluations of full scale performance data, the following treatment sequence was adopted: (1) Primary sedimentation, (2) Two-stage biological filtration, (3) A mechanically aerated lagoon with 10 days retention during peak flow, and (4) Existing treatment ponds. THE WULKATAL TREATMENT PLANT - COMBINED TREATMENT OF FOOD PROCESSING WASTES BY A LOWLY LOADED ACTIVATED SLUDGE PROCESS,

Amt der Burgenlandischen Landesregierung, Eisenstadt (Austria).
W. Stalzer.
Progress in Water Technology, Vol 12, No 3, p 251-261, 1980. 4 Fig, 6 Tab, 8 Ref.

Descriptors: *Waste water treatment, *Aeration, *Chemical precipitation, *Activated sludge, Treatment facilities, Municipal wastes, Industrial wastes, *Food processing industry, Canneries, Costs, Energy, Austria.

Extended aeration with simultaneous precipitation (Fe++) was used to treat municipal sewage, effluent from a canning operation, and effluent from a sugar beet processing plant. Variation in load ranged from 300 kg BOD5/day to 9000 kg BOD5/day. Excellent effluent concentrations were obtained: 8.6 mg/liter BOD5, 19.5 mg/liter COD, 6.9 mg/liter total coliforms, 0.7 mg/liter NH4-N, 15.2 mg.liter NO3-N, and 1.4 mg/liter PO4-P. Despite no controlled denitrification and full nitrification, 45% total-N was removed as well as 90% total P. Sixty to 70% of influent COD load contributed to respiration, and 25 to 35% was incorporated into excess sludge. Specific energy consumption for the plant was 1.6 kWh/kg BOD5. The plant required a small staff and produced a small amount of excess sludge. Disadvantages included the high energy requirements and higher construction cost compared to more highly loaded plants. (Small-FRC)
W81-01647

5E. Ultimate Disposal Of Wastes

INSTALLATION FOR TREATMENT OF SEDIMENTS COMING FROM STATIONS FOR PURIFICATION OF INDUSTRIAL WASTE WATER,
Regie Nationale des Usines Renault, Boulogne-Billancourt (France). (Assignee).
M. Petiot.
U. S. Patent No 4,198,914, 4 p, 1 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 993, No 4 p, 1194, April 22, 1980.

Descriptors: *Patents, *Waste water treatment, *Sediments, *Industrial wastes, Sludge, Sludge disposal, Incineration, Industrial plants.

An installation for the treatment of sediment coming from a purification station for industrial waste water consists of a static furnace incinerator into which sediment is transferred by means of an injector. The injector is made up of an elbow tube connected between the furnace and the sediment, a blast pipe injecting air into the furnace and drawing sediment with it due to the vacuum created by the blasted air flow, and an additional air inlet in the furnace wall, the additional air inlet surrounding the elbow. The combustion of this detritus proves to be a satisfactory solution, since the treatment of 4 sq m of the latter leads to only about 10 kg of residual ash. However, in putting such a process into operation there is a problem of transshipment of heterogeneous residues between the storage tank and the incinerator. The invention remedies those drawbacks, notably in eliminating the operations of mechanical pumping and filtration, difficult and complex. (Sinha-OEIS)

CHARACTERISTICS OF FULL AND PARTIAL MULTIPORT DIFFUSERS DISCHARGING THERMAL WASTES IN OPEN CHANNEL FLOW,
Florida Univ., Gainesville. Dept. of Civil Engineering.
B. A. Christensen, J. G. Melville, and A. D. Parr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-161085, Price codes: A08 in paper copy, A01 in microfiche. Florida Water Resources Research Center, University of Florida Publication No 49, December, 1980. 156 p, 52 Fig, 3 Tab, 36 Ref, 3 Append. OWRT-A-035-FLA(1), 14-34-0001-7019, 14-34-0001-7020.

Descriptors: *Heat transfer, *Diffusion, *Jets, *Open channel flow, *Thermal pollution, Discharge(Water), Pipe flow, Streamflow, Thermal water, Energy dissipation, Energy transfer, Hydraulics, Channel flow, Continuous flow, Heat flow, Temperature, Evaluation, Mechanical engineering, Equipment, Cooling towers, Waste water(Pollution).

Of the two system types which transfer condenser waste heat to the atmosphere, once-through cooling systems are significantly less costly than closed-cycle cooling systems. For once-through cooling, disposal methods using multiport diffuser-pipes provide the most efficient mixing by discharging the heated water effluent through high velocity jets near the bed of the receiving body of water. In addition, specific State of Florida regulations exist for heated effluent disposal in the Florida Administrative Code. The present work concerns itself with an undistorted physical model of a multiport diffuser-pipe, discharging heated water into a co-flowing ambient. Vertical jet angle and transverse discharge distribution were varied and the resulting mixing characteristics were noted. Best mixing for large distances downstream of the diffuser occurred with a jet angle of ten degrees, but major drawbacks existed. The most promising angle was 20 degrees. In port spacing, no jet interference was observed in the plan isotherms for any of the runs. Finally, it was observed that, for the same quantity of heat to be injected into the ambient, partial diffusers perform much less efficiently than full. The optimal design is to match the diffuser discharge distribution to that of the ambient. (Zielinski-IPA)

CODISPOSAL OF MUNICIPAL SOLID WASTE AND SLUDGE.
Public Works, Vol 111, No 2, p 88-89, 98, February, 1980. 3 Fig, 1 Tab, 1 Ref.

Descriptors: *Waste disposal, *Economics, *Sludge, *Municipal wastes, *Solid wastes, Incineration, Waste water treatment, Air pollution, Landfills, Leaching, Environmental effects, Boilers, Fuels, Energy conversion.

Simultaneous disposal of solid waste and waste water treatment sludges (codisposal) is proposed as a more efficient method of waste disposal and may be handled by landfilling, composting, or thermal destruction. Thermal destruction is useful for recovery of refuse derived fuel from multiple hearth or fluidized bed sludge incinerators, sludge in multiple solid waste (MSW) incinerators, sludge in MSW dedicated boilers, and sludge in MSW starved-air combustors. Of these, the MSW incinerator method proves the most economical. Comparisons of annual costs of the methods yielded estimated combined single purpose costs (in thousands of 1978 dollars) of 5,420 for the multiple hearth/fluidized-bed system, 6,395 for the water-wall method, 6,995 for dedicated boiler techniques, 1,077 for modular incineration and 8,495 for pyrolysis. EPA fundings for co-disposal options are also considered. The remaining questions concerning co-disposal technologies focus on environmental issues. Problems of air emissions and leachate from combustion residue matter landfills are the main ecological disadvantages of such systems. (Geiger-FRC)

5F. Water Treatment and Quality Alteration

PILOT STUDY OF FLUORIDE AND ARSENIC REMOVAL FROM POTABLE WATER,
Rubel and Hager, Inc., Tucson, AZ.
F. Rubel, Jr., and F. S. Williams.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-111080, Price codes: A03 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-100, August, 1980. 43 p, 5 Fig, 6 Tab, 8 Ref, 3 Append. 68-03-1351.

Descriptors: *Potable water, *Water purification, *Arsenic, *Fluorides, Adsorption, Water treatment, Pilot plants, Treatment facilities, Costs, Arizona, Activated alumina.

Fluoride and arsenic are two contaminants frequently found in high concentrations in drinking water. Occasionally, the two contaminants are found together in the same water supply, which presents a unique treatment problem. Pilot plant studies were conducted on the removal of fluoride and arsenic from potable water using activated alumina as the adsorbent. The tests were conducted using water from the community of Why, Arizona, that contained 3 mg/l fluoride and 0.15 mg/l arsenic. Activated alumina is shown to be effective means of treating this water. Arsenic is preferentially adsorbed on the activated alumina, and a stronger sodium hydroxide solution (4%) is required during regeneration of the activated alumina for arsenic than for fluoride (1%). The capacity of the alumina for removing fluoride is decreased by any arsenic remaining in the alumina. The pilot studies indicate that the preferred method of treating water with these combined contamiants is the use of two activated alumina columns in series. A schematic of a full-sized treatment plant is included, along with engineering estimates of operating and capital equipment costs for small communities. Operating costs are approximately 5 cents per kiloliter of treated water (19 cents per 1000 gallons). (Moore-SRC)
W81-01437

PACKAGE WATER TREATMENT PLANTS, VOLUME 1. A PERFORMANCE EVALUATION,
Cincinnati Univ., OH. Dept. of Civil and Environmental Engineering.
J. M. Morand, C. R. Cobb, R. M. Clark, and R. G. Stevie.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-110934, Price codes: A04 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-008a, July, 1980. 54 p, 10 Fig, 13 Tab, 8 Ref, 2 Append. GS-05S-10458.

Descriptors: *Water treatment, *Treatment facilities, *Potable water, *Rural areas, Kentucky, West Virginia, Tennessee, Costs, Turbidity, Water quality, Water purification, Operation and maintenance.

Many small and rural water systems have both cost and quality problems. Their unit costs tend to be higher because of the small number of connections they service. Package water treatment plants are a possible alternative to conventional water treatment. These plants are self contained units that can be installed for minimum cost. Results from a study of 36 package plants in Kentucky, West Virginia and Tennessee show that these treatment plants can provide water that meets the turbidity limits established under the National Interim Primary Drinking Water Standards. Plants that were not meeting standards had problems caused by lack of operator attention, such as not varying chemical dosage to meet changing raw water quality, or they were not running for lengths of time sufficient to achieve stable operation. These plants, contrary to some manufacturers' claims, are not totally automatic but require supervision. Nevertheless when properly maintained and operated, they can provide good quality drinking water at minimum cost. (Moore-SRC)

W81-01440

SPLIT FLOW WATER TREATMENT PLANT,
Neptune Microfloc, Inc., Corvallis, OR. (Assignee).
A. K. Hsiung, and G. F. Eaton.
U. S. Patent No 4,199,451, 5 p, 4 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 993, No 4, p 1372, April 22, 1980.

Descriptors: *Patents, *Water treatment, *Waste water treatment, Water purification, Flow control, Settling basins, Flocculation, Filtration, Water levels, Equipment.

It is an object of this invention to provide a packaged water treatment plant that will permit more cost-effective design configurations, provide treated water in larger capacities, and which will be applicable to both water and waste water treatment. The split flow water treatment plant includes a settling basin comprising a pair of banks of generally horizontally extending settling tubes and an inlet baffle comprising parallel vertical perforated sheets upstream of and adjacent to each of the banks. An inclined diverting plate extends from the downstream end of the lowermost tube in the first of the banks to the upper upstream end of the inlet baffle adjacent the second bank. The distribution of flow between the banks may be regulated by an adjustable weir or by water level control. (Sinha-OEIS)
W81-01445

FILTER APPARATUS USING FLOATING FILTER MEDIUM,
Ishigaki Kiko Co. Ltd., Tokyo (Japan). (Assignee).
A. Iwatani.
U. S. Patent No 4,198,301, 9 p, 4 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 993, No 3, p 986-987, April 15, 1980.

Descriptors: *Patents, *Water treatment, *Water quality control, Filtration, Separation techniques, *Filters, Equipment, Backwashing, Floating filter medium.

A filter apparatus contains a filter tank separated by a water-penetrable partition wall into an upper section forming a filtrate reservoir and a lower section forming a filter chamber. Floating filter medium is place in the filter chamber. Water to be filtered is fed into the filter chamber at the bottom and caused to flow upward, passing through the floating filter medium. The filtrate is removed from the reservoir. The apparatus is further characterized by the improvements including: apparatus for agitating the filter medium, a pit beneath the filter chamber, a siphon-shaped discharge pipe for back-flow wash water with a discharge opening positioned adjacent the bottom of the pit, the discharge pipe being provided with a siphon breaker having an air feed port positioned adjacent the bottom of the filter chamber, a supply pipe for feeding water to be filtered into the filter chamber with a feed opening positioned adjacent the bottom of the filter chamber so as not to disturb water retained in the pit. (Sinha-OEIS)
W81-01453

PROCESS AND APPARATUS FOR TREATING DRINKING WATER,
Consolidated Foods Corp., Old Greenwich, CT. (Assignee).
J. J. Doumas, A. H. Molof, G. H. Raymond, and L. Wikstrom.
U.S. Patent No 4,198,296, 14 p, 11 Fig, 7 Ref; Official Gazette of the United States Patent Office, Vol 993, No 3, p 984, April 15, 1980.

Descriptors: *Patents, *Water treatment, *Water quality control, *Water purification, Suspended solids, Halides, Activated carbon, Oxidation, Disinfection, *Silver ions.

A process and apparatus for producing biologically safe and palatable drinking water is described in which water may be preconditioned by removal of suspended solids and further subjected to removal of halide ions and then subjected to treatment with a disinfectant or combination of disinfectants capable of exercising suitable biocidal and virucidal action. This may be followed by steps and the utilization of apparatus to reduce below the legal limit for potable water the disinfectant. The disinfectant may be supplied by a compound capable of releasing silver ions by contacting the water with a media of activated charcoal having absorbed silver salts. Oxidizing disinfectants may be applied as solutions or soluble solids either alone or in sequence with silver ions. Objectionable amounts of the disinfectant may be reduced to the amount below the legal limit for potable water by passing the treated water through an activated charcoal media which is sanitized against bacterial growth or through ion exchange resins similarly sanitized or through a combination of both. The invention involves use of silver ions in the absence of chloride as a purifying agent. The use as purifying agents of other metallic ions, such as mercury ions or oxidizing disinfectants is also facilitated by the prior elimination of halide ions. (Sinha-OEIS)
W81-01458

WATER QUALITY EFFECTS RELATED TO BLENDING WATERS IN DISTRIBUTION SYSTEMS,
Southern California Metropolitan Water District, Los Angeles.
W. K. Schimpff, and H. E. Pearson.
Environmental Protection Agency Report EPA-600/2-80-132, August, 1980. 106 p, 25 Fig, 15 Tab, 15 Ref, 1 Append. R804709.

Descriptors: *Water distribution(Applied), *Water quality, *Imported water, *Corrosion, *Water chemistry, California, Diurnal, Corrosion control, Groundwater, Hardness(Water), Water properties, Alkalinity, Hydrogen ion concentration, Calcium carbonate, Water supply, Zinc phosphate, *Water blending effects.

In an area with a regional supplemental water supply there is the chance that a given water distribution system may be exposed to two waters of different quality and origin, and to various blends of the two waters, which could have an adverse effect on the distribution system itself or on the quality of the water. The Environmental Protection Agency mobile water quality monitoring laboratory was deployed at 30 selected sites in southern California where imported waters from the Colorado River and California aqueducts are used as delivered or blended with local groundwaters. Eighteen computer controlled parametric systems on board the laboratory analyzed and recorded field data to assess water quality factors associated with corrosion and stability. The waters studied could be classified as having moderate to high hardness, alkalinity and total dissolved solids content. The data were analyzed for significant interrelationships relative to pH, calcium hardness, alkalinity, dissolved minerals, corrosion rates, calcium carbonate deposition test results, and calculated values for the Langelier saturation and Ryzner stability indices. For waters of similar chemical composition the calcium carbonate deposition test results were more indicative of the benefits to be derived from pH control or zinc phosphate films for mitigating corrosion than the polarization corrosion rates. In one case, the diurnal shifting from one water source to another resulted in higher corrosion rates during the period when the surface water was blended with the well water than when either water was delivered alone. On the basis of this study, the blending of imported surface waters and their mixing with local groundwaters in this regional water system has not generated serious water quality problems in the distribution systems of the area. AN OVERVIEW OF EUROPEAN WATER TREATMENT PRACTICE,
Water Storage Corp., Rotterdam (Netherlands).
P. L. Knoppert, G. Oskam, and E. G. H. Vreedenburgh.
Journal of the American Water Works Association, Vol 72, No 11, Part 1, p 592-599, November, 1980. 9 Fig, 17 Tab.

Descriptors: *Water treatment, *Water pollution treatment, *Storage, *Europe, Water quality control, Water purification, Organic chemicals, Ammonia, Chlorination, Rivers, Ozone, Monitoring, Bioindicators, Coagulation, Rhine River, Activated carbon.

Although European river water quality has improved with respect to certain parameters, the micropollutant load is still a major problem. This paper discusses recent water technology developments in several European countries. Automatic monitoring continuously measures water quality in major rivers. Several countries use the behavior of live rainbow trout to warn of high pollution levels, especially an accidental release of toxic material. Emergency storage protects against accidental pollution situations and during periods of low flow. Storage also decreases the concentration of ammonia, heavy metals, bacteria, organic chemicals, and other contaminants. Chlorination of raw water before transport has been largely eliminated to reduce production of trihalomethanes. Biological nitrification is used to oxidize ammonia in place of breakpont chlorination. Some cities now use chlorine dioxide or ozone in place of chlorine. Reducing precursor levels is accomplished by using improved coagulants (alkaline polyaluminum chloride), optimized floc separation techniques, and granular or powdered activated carbon. (Cassar-FRC)

CANCER MORTALITY AND PUBLIC DRINKING WATER IN ST. LOUIS CITY AND COUNTY,
Missouri Univ.- Columbia.
C. J. Marienfeld, M. D. Collins, H. T. Wright, R. Reddy, and G. Shoop.
Journal of the American Water Works Association, Vol 72, No 11, Part 1, p 649-654, November, 1980. 5 Tab, 14 Ref.

Descriptors: *Potable water, *Mortality, Epidemiology, Public health, *Cancer, St. Louis, *Water pollution effects, Pathology, Human diseases.

Cancer death certificates for St. Louis City and County were classified according to residential areas served by the different water sources identified: the Missouri River, the Meramec River, and a deep well. The latter two sources were hypothesized to have lower carcinogen contents than the Missouri River water. However, the higher cancer death rate in the city of St. Louis as compared with the adjacent St. Louis County was concluded not to be a result of differences in the city and county water supplies for the period of study, 1960-1976. In fact, no significant differences in water quality are seen in the common source, the Missouri River, in the treatment processes, in Ames mutagenicity tests, nor in inorganic chemical analyses. The mortality rates appear to be inversely correlated with income and school years completed, and directly correlated with the percentage of incomes below the poverty level, percentage of unskilled workers, and air pollution as measured by suspended particulates and sulfur dioxide. (Cassar-FRC)

ELEVATED LEVELS OF SODIUM IN COMMUNITY DRINKING WATER,
Massachusetts Univ., Amherst.
E. J. Calabrese, R. W. Tuthill, J. M. Klar, and T. L. Sieger.
Journal of the American Water Works Association, Vol 72, No 11, Part 1, p 645-649, November, 1980. 2 Fig, 1 Tab, 21 Ref.

Descriptors: *Sodium compounds, *Potable water, *Blood pressure, Hypertension, Water pollution effects, *Massachusetts, Standards, Human diseases, Salinity, Water properties.

Students in two geographically contiguous Massachusetts towns with similar socio-economic conditions and differing sodium levels in the drinking water were subjects of a blood pressure study. Both third grade and tenth grade students in the community with higher sodium content (107 mg per liter) in the water supply had statistically significantly higher blood pressures than those children from the low sodium area (8 mg per liter). Systolic and diastolic readings differed by about 3-5 mm Hg between the two communities. Excretion studies on the third graders showed Na-K ratios of 5.4 (boys) and 5.1 (girls) for those drinking high sodium water and 3.7 for those in the low sodium area. (Cassar-FRC)

RESOURCE MANAGEMENT OF AN INDUSTRIAL RIVER SYSTEM,
Yorkshire Water Authority (England).
K. H. Tattersall.
Journal of the Institution of Water Engineers and Scientists, Vol 34, No 5, p 453-473, 1980. 4 Fig, 3 Tab.

Descriptors: *Management, *River systems, *Reviews, Riparian rights, Sewage treatment, Rivers, Water quality, Legal aspects, Water resources, Resource allocation, Geology, Topography, Flow rates, River basin development, Industrial wastes, Industrial water, *Yorkshire River System(UK), *England.

Management of an industrial river may call for its proper use as a drainage channel, a source of water power, or a hydro-cooling device. In Great Britain the Water Resources Act of 1963 and the Control of Pollution Act of 1974 are aids in water resource management in controlling the use of industrial rivers. The Yorkshire River system is examined as typical industrial river, and its management by the Yorkshire Water Authority is reviewed. The topography, geology, and tributaries of the system as well as the populations that they serve are outlined. Among the hydrologic considerations of an industrial river, the dry weather flow is an important management parameter. Flow diagrams are used to estimate flow information at various points along the river. River water quality models are usually calculated for each pollutant to aid in the management of the industrial river. The Water Resources Act set guidelines for compensation water to meet modern requirements. Other aspects of industrial rivers that are examined include water power, fish farming, irrigation, industrial and groundwater abstractions, mine drainage, sewage treatment, and trade effluents. The Water Authority is responsible for managing a river to satisfy the greatest number of interests and preserve riparian rights. (Geiger-FRC)

UPGRADING THE OLD WHILE BUILDING THE NEW,
Inca, Ltda, Cali (Colombia).
L. E. Medina, and H. E. Hudson, Jr.
Journal of the American Water Works Association, Vol 72, No 12, p 666-671, December, 1980. 4 Fig, 5 Ref.

Descriptors: *Water treatment, *Construction, Water quality control, Construction costs, Costs, Planning, *Colombia, Water demand, Potable water, Deforestation, Turbidity, On-site investigations, Low flow, Flocculation.

The upgrading of an already existing water treatment plant during the construction of a new facility to meet increased consumer demand is reviewed. The Rio Cali plant was 50 yrs old. The renovation undertaken allowed its capacity to be increased and advantage taken of the low turbidity of the Rio Cali throughout most of the year. An additional advantage is that the plant serves the higher, older part of the city by gravity, thus reducing energy costs. The study included a determination of the hydraulic capacity of the system, a study of the processing capacity of existing structures, and the design of modifications to yield increased capacity. The maximum capacity of the raw water canal was determined to be set for 173 ML/day. The flocculation, sedimentation, and filtration systems are described. The modification was undertaken in a series of steps, since the service could not be interrupted. (Baker-FRC)

NEW DAY DAWNS FOR CALIFORNIA WATER,
T. S. Maddock, and D. L. Hardan.
Water and Wastes Engineering, Vol 17, No 10, p 39-42, October, 1980. 1 Fig, 3 Tab.

Descriptors: Networks, *Treatment facilities, *Municipal water, Industrial water, *California, Flocculation, Filtration, Chlorination, Chemicals, *Irrigation water, Agriculture, Telemetry, *Domestic water, Quartz Hill treatment plant(CA).

The Quartz Hill water treatment plant, which will provide full treatment for 14 mgd of raw water and will eventually expand to treat 56 mgd, is described as the major facility in the DAWN (Domestic and Agricultural Water Network) water distribution system. DAWN will distribute 140,000 acre-feet of water annually for municipal and industrial use through a 150 mile distribution network. The Quartz Hill water treatment plant is the administrative headquarters of DAWN and houses the project management and operational facilities, including the central computer. Influent first passes through a moss screen, then water is treated as needed with chemicals: chlorine, alum, polyelectrolytes, caustic soda, and activated carbon. Following mixing with chemicals, flocculation is performed. Water is clarified and passed through four dual media filters. After chlorination, the water is released to the distribution system. Sludge is dewatered and transported to a Class 2 disposal area. (Small-FRC)

NEW YORK CITY'S PILOT PLANT FILTER STUDIES,
Metcalf and Eddy, Inc., New York.
G. P. Fulton.
Public Works, Vol 111, No 4, p 62-64, April, 1980. 3 Fig.

Descriptors: *Pre-treatment, *Pilot plants, *Filters, *Water treatment, Model studies, Turbidity, Color, Organoleptic properties, Water quality, Filtration, Sludge, Flocculation, Porous media, Costs, *New York City.

The high costs of water treatment, resulting in part from the stringent regulations of the Federal Safe Drinking Water Act, have led to a number of pilot plant studies aimed at upgrading the water quality of the Croton System, a 375 square mile major watershed of the New York City area. In the spring of 1971, the Croton supply was plagued with unsatisfactory organoleptic features attributed to an increased nutrient load from excessive urban development, and consequently better water treatment methods were sought. Various piping arrangements in pilot plant studies allowed the use of all, some, or none of four pretreatment chambers which offered flocculation, settling or filtration. Filtration options involved the use of dual anthracite/sand media or Neptune Microfloc multimedia. The flow rate through each pretreatment pattern was kept at 10 gpm, and turbidity was continuously recorded from inlet raw water, filter manifold water, and filter effluents. Piezometric measurements were made manually by manometer for each filter. After 14 months of testing, no distinct prototype simulations were obtained from the settling experiments due to unpredictable sludge depths. The granular filter performed well in the pilot simulation, but care must be taken during filter washings to eliminate trapped air surges. The release of dissolved air near filter heads due to changes in water temperature must also be carefully monitored by the operator. It was also noted that full-sized filter units cannot be effectively simulated in pilot column installations, and care must be taken in selecting a single spray nozzle with a proper discharge pattern. Some energy and costs considerations for the pilot pretreatment systems are also given. (Geiger-FRC)

ECONOMICAL ZERO DISCHARGE ACHIEVED AT WATER PLANT,
Wauford (J. R.) and Co., Nashville, TN.
R. C. Woods.
Public Works, Vol 112, No 1, p 65, January, 1981.

Descriptors: *Water treatment, *Treatment facilities, *Settling basins, *Water purification, Potable water, Sludge disposal, Lime, Chemicals, Project post-evaluation, Tennessee, Costs, Lewisburg(TN).

The city of Lewisburg, Tennessee, acting as its own general contractor, built a 4 mgd water treatment plant with no waste water discharge for $172,000. The treatment facility consists of a large reinforced settling tank with a total water volume of 250,000 gal. This tank functions as a gravity thickener, with dual rectangular hoppers for sludge withdrawal and a telescoping valve for decanting supernatant. The thickened sludge is dewatered on open-air sand drying beds, and final disposal is on city owned property by trench burial. Treatment chemicals are alum, lime, and occasionally potassium permanganate and activated carbon. Thus the sludge is basically an alum-lime sludge. The supernatant is recycled, making zero discharge of waste water possible. Thus, no waste water is discharged back into the Duck River. Through proper management, the city was able to build a very successful plant itself. (Small-FRC)

COALESCENCE OF OIL IN OIL/WATER EMULSIONS,
Imperial Chemical Industries Ltd., London (England). (Assignee).
D. B. Chambers, and B. Walker.
U. S. Patent No 4,199,447, 4 p, 6 Ref; Official Gazette of the United States Patent Office, Vol 993, No 4, p 1371, April 22, 1980.

Descriptors: *Patents, *Water quality control, *Oil pollution, *Water pollution treatment, Emulsions, Coalescence, Plastics, Separation techniques, Oleophilic properties.

This invention related to a method for the removal of oil from an oil in water emulsion by passing the emulsion through a fibrous structure comprising fibres having finely divided particles having an average size of one micron or less and which exhibit oleophilic and hydrophobic properties adhered to and penetrating their outer surfaces, and removing the coalesced oil droplets so formed. A particularly desirable expanded plastics material for this purpose is a hydrophilic plastics material

such as a hydrophilic polyurethane foam. (Sinha-OEIS)

OIL/WATER SEPARATION PROCESS AND APPARATUS,
Imperial Chemical Industries Ltd., London (England). (Assignee).
G. F. G. Clough.
U.S. Patent No 4,199,446, 6 p, 2 Fig, 8 Ref; Official Gazette of the United States Patent Office, Vol 993, No 4, p 1371, April 22, 1980.

Descriptors: *Patents, *Water quality control, *Water pollution treatment, *Oil pollution, Emulsions, Coalescence, Equipment, Flow control, Separation techniques, Gravity separation.

Oil is removed from an oil in water emulsion by a process in which the emulsion is passed through a coalescer which coalesces the oil droplets within the emulsion so that they can be removed by gravity separation. The emulsion is passed into and through a vessel containing a rectangular shaped oil coalescer which is immersed in the emulsion so that the emulsion flows through the coalescer from a first face to a second face. During operations suspended solids are retained on the upstream face of the coalescer and the passageways through the coalescer are progressively obstructed by the solids. Changing the position of the coalescer within the vessel and reversing the direction which the emulsion flows through the coalescer allows the emulsion to flow through the coalescer from its second face to the first face. The temporary reversal of flow through the coalescer causes a substantial proportion of the retained solids to be dislodged and removed in the stream. (Sinha-OEIS)

STATISTICS FOR GROUNDWATER QUALITY ASSESSMENT,
Calscience Research, Inc., Huntington Beach, CA.
R. D. Morrison, and R. J. Stearns.
Public Works, Vol 111, No 2, p 90, 100, February, 1980. 2 Tab.

Descriptors: *Statistical models, Water quality, *Water quality control, Monitoring, *Groundwater, Leaching, Landfills, Waste disposal, Wells, Probability, Water pollution sources, Mathematical studies, Equations.

As groundwater quality monitoring programs expand, the maintenance of an overall perspective becomes more difficult. Often officials must rely on data obtained from the sampling of well networks to monitor the quality of an underground water supply. This system is useful in checking for contaminating leachates from waste disposal sites when complete physiographic baseline data is available. Statistical models are described to aid in reducing judgmental errors in monitoring practices. Sampling wells must be categorized in terms of their relationship to the contamination source. The categorization system distinguishes a background well, an onsite well, a downstream well, and an underlying well. The parametric r, Student's t test, and the Mann-Whitney U test provide a wide range of statistical accuracy. An equation is given to generate probability values (P). Low P values (less than .05) are suggestive of a relationship between two well groups, while P values greater than .05 indicate a lower probability of a relationship between well groups. The system provides useful data about the relationship of a disposal site to observed groundwater quality degradation. (Geiger-FRC)

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

AN EVALUATION OF MICHIGAN'S WETLAND PROTECTION ACT AND RECOMMENDATIONS FOR ITS IMPLEMENTATION,
Great Lakes Basin Commission, Ann Arbor, MI.
R. A. Sullivan, and C. Wyman.
Great Lakes Environmental Planning Study (GLEPS), Contribution No 27. August, 1980. 171 p, 16 Fig, 3 Tab, 3 Append.

Descriptors: *Michigan, *Wetlands, *Coastal marshes, *Water values, *Management, Flood protection, Aquatic habitats, Wildlife habitats, Groundwater recharge, Project planning, Project benefits, Bogs, Swamps, Marshes.

The Goemaere-Anderson Wetland Protection Act of 1980 is the result of a long-term effort to provide Michigan's wetlands with comprehensive and meaningful protection. The key provisions of the act are presented and analyzed. To make the act most effective, it is necessary to identify the major questions and problems most likely to arise in implementing it. A number of issues should be addressed by the Department of Natural Resources (DNR), including delineation of regulated wetlands, further clarification of certain Section 9 standards for permit review, determining an effective date for 'grandfathered' status to be assigned to a project, administration of a general permitting system, and means to deal with upland uses directly impacting wetlands. The DNR should initiate an active information/education effort to familiarize the public with the requirements and benefits of the act; in the process, DNR may learn of some non-regulated wetlands. Monitoring and enforcement should be a key part of the protection program. Procedures should be developed to define wetlands and to evaluate and estimate project impacts. A continuous evaluation of the program from its inception should be instituted; such an evaluation could save money and increase wetlands protection. Michigan's fiscal troubles underscore the necessity of carefully evaluating different program elements for their contribution to the ultimate program goals. (Atkins-Omniplan)

FLOOD CONTROL OPERATIONS AND OPTIMIZATION: A CASE STUDY FOR BONNY RESERVOIR, COLORADO,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
J. Kimzey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-163586, Price codes: A09 in paper copy, A01 in microfiche. MS Thesis, Summer, 1980. 179 p, 76 Fig, 20 Tab, 36 Ref, 7 Append. OWRT-B-195-COLO(2).

Descriptors: Reservoirs, *Flood control, *Flood routing, Operation optimization, *Optimization, Simulation analysis, Storm runoff, Hydrographs, Forecasting, Bonny Reservoir, South Fork Republican River(CO), Colorado.

Flood control operations for reservoirs are evaluated by discussing existing policies and optimization and simulation techniques. A case study for Bonny Reservoir, Colorado, routes five generated storm hydrographs through the reservoir considering the influence of the downstream reservoir. The storms are routed by a computer algorithm which simulates the standard operating rule and by a dynamic programming optimization algorithm. The resulting releases were lower for the more extreme storm events and higher for the less extreme storm events with the dynamic programming algorithm than the simulated standard operating rule.
W81-01494

PLANNING GROUNDWATER SUPPLY SYSTEMS FOR URBAN GROWTH: A MULTILEVEL PERSPECTIVE,
Purdue Univ., Lafayette, IN. School of Civil Engineering.
J. W. Delleur, S. A. Dendrou, and G. V. Loganathan.
In: Water and Related Land Resource Systems. International Federation of Automatic Control Symposium, Cleveland, Ohio, 28-31 May, 1980, p 239-249, 1980. 6 Fig, 7 Tab, 17 Ref. Pergamon Press, New York. OWRT A-057-IND(2) and B-083-IND(12).

Descriptors: *Groundwater, *Urban water supply, Finite elements, Large scale systems, Mixed integer programming, Optimization, Urban systems, Water resources, Planning, Water supply, Urbanization, *Groundwater supply, *Model studies, Costs, Indiana, West Lafayette(IN).

A methodology has been developed to include effectively water supply from groundwater in urban planning. The model LANDUSE for prediction of urban development and water demand is linked to the model WATSUP, an optimization oriented finite element based water supply model for prediction and optimization of future water supply configurations. The nonlinearity of the objective function due to nonlinear head losses has been circumvented by means of empirical relationships for head losses and design criteria for pump and pipe sizes. The requirement that some decision variables such as the number of wells, equalizing reservoirs, etc. be integer variables leads to a mixed integer programming formulation. A two level coordination scheme is used in locating an optimal number of facilities such that cost is minimized and a safe exploitation of aquifer in the future is guaranteed. The methodology is applied to an actual situation in West Lafayette, Indiana.

PRACTICAL ASPECTS OF TOWN WATER PLANNING,
P. G. Fischer, Jr., and T. T. Chiang.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 159-172, March, 1980. 7 Fig.

Descriptors: *Planning, *Computer models, *Water demand, Model studies, Mathematical models, Runoff, Water requirements, River basin development, Watersheds, *Water supply, Precipitation, Rainfall disposition, Costs, Diversion, Water management, Probability, Ipswich River Basin, *Municipal water.

A case study was made of the practical aspects of town water-supply planning to demonstrate the importance of probability distributions of estimated demands and rainfall and to explain the use of digital computer modeling as a method for analyzing these probability distributions. The involvement of the 'systems' aspects along the reach of the river, including legal constraints, was also demonstrated. The Ipswich River Basin served as the study site, and the precipitation, population, projections, and water demand projections of this area are outlined. A 'safe yield' and a drought yield approach are examined for precipitation design purposes. Results have shown that the Nicholas Brook area would provide a divertable flow when combined with the existing impoundment storage, while the new 1.3 billion gallon Emerson Pond Reservoir would add 9.0 mgd. Raising the pool elevation of Swan and Middletown Ponds would create a 'safe yield' of 10.0 mgd. A data base for runoff data gave a detailed analysis of projected quantities and diversion rates, while knowledge of the precipitation probability allowed power costs to be developed. Energy and equipment costs and legal and topographical constraints are also examined. (Geiger-FRC)

COMMENT ON 'STOCHASTIC OPTIMIZATION OF WATER SUPPLY EXPANSION' BY M.G.V. BOGLE AND M. J. O'SULLIVAN,
Army Engineer Waterways Experimental Station,

Vicksburg, MS.
T. M. Walski.
Water Resources Research, Vol 16, No 6, p 1138, December, 1980.

Descriptors: *Estimated costs, *Water supply, *Construction costs, Planning, Water distribution(Applied), Public utilities, Cost analysis, Economics, Diseconomies of scale, Unit costs, Project planning.

The author suggests that the Bogle and O'Sullivan method (1979) for scheduling water supply plant expansion may have no practical application. Basically, the method describes construction of a water plant with annual incremental capital expenditures rather than expansions in 10 to 30 year increments. O'Sullivan and Bogle answer that their method applied to a particular type of plant capacity expansion problem which occurs in some water supply systems. The work was motivated by a proposed plant for Auckland, New Zealand. (Cassar-FRC)

A MODEL FOR LAND USE AND WATER QUALITY,
Washington Univ., Seattle. Graduate School of Public Affairs.
L. D. Goodisman, and F. Caslich.
Water Supply and Management, Vol 4, No 5/6, p 371-377, 1980. 6 Fig, 6 Ref.

Descriptors: *Water quality, *Land use, *Model studies, Planning, Washington, River basins, Water pollution sources, Municipal wastes.

A model for the relationship between land use and water quality was developed and tested to provide data on pollution from non-point sources. This information may be used for planning purposes and to set priorities for pollution abatement. It specifies a chain of relationships between land ownership (forest or park service, Indian, state, private) and hydromodifications (reservoir, channel, agricultural), between water parameters and water quality, between water quality and land use (agriculture, urban, range, forest), and between hydromodifications and river basin properties. As applied to river basins of the State of Washington, the model predicted 88% of the variation in biological water quality and 96% of the variation in recreational water quality. (Cassar-FRC)
W81-01571

CO-ORDINATION OF MODELS IN SOFTWARE SYSTEMS FOR LARGE SCALE WATER RESOURCES PROJECTS,
Soyuzgiprovodkhoz, Moscow (USSR).
A. S. Berezner, and F. I. Ereshko.
Water Supply and Management, Vol 4, No 4, p 253-262, 1980. 9 Ref.

Descriptors: *Mathematical models, *Water resources development, Model studies, Data processing, Stochastic processes, Computer models, Agriculture, Hydroelectric power, Water resources, Simulation analysis, Water supply development, Watershed management, River basin development, Water utilization, Recreation facilities, Design criteria.

Procedures are suggested for carrying out experiments on simulation systems for developing river basins using optimization and game-theoretic models. The system combines research from mathematicians, design engineers, agronomists, ichthyologists and other specialists under a process of computerized information management. Emphasis is placed on the development of scenarios to define control and stochastic parameters within the system of models. The generation of a water supply system scenario is described in detail. The simulation system for examining river basins used the following block models: water resources, agriculture, hydro-electric power, development of industry and of communal services, fishing, river transportation, and the sea. The interrelations of the water resources block, the agricultural block and the hydro-electric block are explained mathematically. The roles of sub-blocks of the agricultural block (the animal husbandry and plant sub-blocks) in the model are also explored. (Geiger-FRC)

6B. Evaluation Process

RESEARCH NEEDS IN MODELING AND DATA INTERACTIONS AS RELATED TO GOVERNMENT WATER RESOURCES PROGRAMS,
D. R. Dawdy, and T. Maddock, III.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-161002, Price codes: A04 in paper copy, A01 in microfiche. Completion Report to Office of Water Research and Technology, October, 1980. 50 p, 1 Tab, 28 Ref. OWRT-C-90293-T(No 9629)(1), 14-34-0001-9629.

Descriptors: *Research priorities, *Model studies, *Data collections, *Water resources, *Federal project policy, Federal government, Institutions, Management, Research and development, Evaluation, Planning, Project planning, Testing, Design, Experimental models, Mathematical models, Estimating, Hydrologic data, Theoretical analysis, Governmental interactions, Networks.

Four research areas were examined as they relate to three topics, groundwater, surface water, and, to a minor extent, water quality; since the problems and models for each of the three topics raise different questions. The research areas examined were: (1) assessment of problems facing water resources managers; (2) describing how models fit into programs developed to solve water resources problems; (3) assessing how well models fit program objectives; and (4) assessing data requirements for the models in terms of the way data requirements, models, and programs interact. About 40 questions were developed and categorized in the assessment of models, data needs, and government programs that use these models and data, to identify research needs. It was also generally concluded that: a central clearinghouse is needed concerning model use to judge the use and appropriateness of models; research should be undertaken into attitudes toward modeling; the worth of existing data and situations of no data should be evaluated as related to modeling; and that model uncertainty analysis should be applied more widely and consider economic impacts for model requirements that generate data requirements. (Zielinski-IPA)
W81-01429

PRELIMINARY ANALYSIS OF HYDROPOWER PRODUCTION FEASIBILITY AT TWENTY-ONE EXISTING DAM SITES IN THE STATE OF MINNESOTA,
Minnesota Univ., Minneapolis. St. Anthony Falls Hydraulic Lab.
J. Gulliver, R. J. Garver, R. E. A. Arndt, and C. E. Bowers.
Project Report No 196 prepared for State of Minnesota Energy Agency, August, 1980. 25 p, 5 Fig, 5 Tab, 9 Ref.

Descriptors: *Minnesota, *Hydroelectric plants, *Damsites, *Feasibility studies, Power head, Hydraulics, Hydrologic data, Discharge(Water), Inflow, Flow rates, Rehabilitation, Economic feasibility, Cost repayment, *Hydropower production feasibility.

A preliminary estimate of hydropower production feasibility was made for twenty-one existing dam sites in the State of Minnesota. The purpose of the preliminary analysis was to determine whether a comprehensive feasibility study is justified for the site. The expected annual energy production and initial project cost were estimated for each site. Initial cost estimates include turbine, generator, transmission line, and other electromechanical features as well as the civil features of hydropower retrofitting. Initial cost does not include dam rehabilitation, since the required information is not available for 19 of the 21 sites. The 'relative cost' of the project was defined as the initial cost divided by the annual energy production, and was calculated for each site. The relative cost and general curves for payback period were used to estimate hydropower feasibility at each site. The results of the preliminary analysis are: 5 sites have good or very good hydropower feasibility, 6 sites are marginal, and 10 sites have poor hydropower feasibility. Estimates of the cost of a comprehensive feasibility study are included for each site. (Author's abstract)

Colorado Water Resources Research Institute, Colorado State University Competion Report No 102, September, 1980. 50 p, 5 Fig, 13 Tab, 46 Ref. OWRT-B-175-COLO(1), 14-34-0001-8068.

Descriptors: *Recreation demand, *Economics, Water demand, Recreation facilities, *Reservoirs, Public land, Social aspects, High mountain reservoirs, Public benefits, Evaluation, Front Range(CO), *Colorado.

This report analyzed the public benefits from expanding recreation opportunities at high mountain reservoirs located in the Front Range of Colorado. Until recently, more than 100 reservoirs with 3,500 surface acres were closed to public use, representing 40% of the total surface area of reservoirs at 6,000 to 11,000 feet elevation. A representative sample of 200 persons were interviewed at 14 study sites. Respondents reported willingness to pay contingent on changes in congestion and water level. Benefit functions were adjusted for the effects of crowding, reservoir water drawdown, characteristics of participants, type of recreation facilities present, and costs of management. Policy implications were discussed with emphasis on application of the information to water management decisions. Benefits from expanding recreation opportunities at high mountain reservoirs which until recently were closed, would accrue to all individuals who have access to high mountain reservoirs, because of the reduced congestion which would result at substitute sites. Providing access to one-third more undeveloped and semi-developed reservoirs would increase individual recreation benefits by an average of $3-$6 per user day. However, the same cannot be said for fully developed reservoirs, where expansion of recreation opportunites is not critical in the short run.

QUALITATIVE ASSESSMENT OF THE ECONOMIC IMPACTS OF A RISING WATER TABLE, LAS VEGAS, NEVADA,
Nevada Univ. System, Reno. Water Resources Center.
W. W. Woessner.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-161051, Price codes: A03 in paper copy, A01 in microfiche. Publication No 41068, 1980. 24 p, 7 Fig, 2 Tab, 13 Ref, Append. OWRT-A-091-NEV(1), 14-34-0001-9030.

Descriptors: *Water table, *Groundwater management, *Groundwater movement, *Economic impact, *Irrigation effects, Water injury, Salinity, Infiltration, Lawns, Nevada, Las Vegas Valley(NV).

This effort was directed toward reviewing available information on the shallow groundwater reservoir in Las Vegas Valley and assessing the general

existing and potential economic consequences resulting from evidence of a rising shallow water table. The rising water table is principally a result of excessive lawn irrigation. Over 50% of the valley is within an area in which the water table is less than 50 feet below land surface. Groundwater infiltration and inflow to sewer lines which result in excessive high salinity water for treatment are the current and most immediate future economic impacts. Additional future impacts include recharge of poor quality water to the deeper water supply zone, water-logging of property causing landscaping and foundation damage, and increased groundwater discharge and salinity loading to the Colorado River system. Mitigation methods include reduction of over-irrigation of lawns by voluntary and regulatory methods.

DIFFERENTIALS IN AGENCY POWER: DETERMINING INNOVATIVE CAPABILITY IN WATER RESOURCES AGENCIES,
Arizona Univ., Tucson. Dept. of Political Science.
J. Nienaber.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-161069, Price codes: A06 in paper copy, A01 in microfiche. Completion Report, September 1980. 96 p, 4 Fig, 3 Tab, 43 Ref, 1 Append. OWRT-B-054-ARIZ(1), 14-34-0001-7138.

Descriptors: *Federal government, *Water resources development, *Institutional constraints, *Political constraints, *Creativity, Administrative agencies, Governmental interrelations, Political aspects, Research priorities, United States, Federal jurisdiction, Legal aspects, Institutions, Constraints, Administration, Water management(Administrative), Administrative decisions, Planning, History.

Various internal agency characteristics and external environmental variables were examined that influence the capacity of an agency to take on new responsibilities, obtain increased appropriations/personnel, and establish a predominance within the agency's area of operation. By carrying out a detailed historical analysis of seven Federal agencies (Bureau of Reclamation; Bureau of Land Management; Corps of Engineers; Fish and Wildlife Service; Forest Service; National Park Service; and Soil Conservation Service), six variables were isolated that impact on an agency's ability to innovate. Relative measures of agency appropriations, work force size and perceived status rankings were established through a cross-validation of the historical data, and an agency innovation model was developed. Using this approach, explanation of the strength of some agencies relative to other agencies was assessed. Federal perception of agency strength from interviews with middle/upper level officials of the seven agencies (ranking the other six agencies on four variables: relative power within Executive Branch; close relationship with Congress; Interest Group support; quality of response to NEPA), ranked the Corps of Engineers highest and the Forest Service, second. VULNERABILITY OF WATER SUPPLY SYSTEMS TO DROUGHTS,
Utah Water Research Lab., Logan.
D. S. Bowles, T. C. Hughes, W. R. James, D. T. Jensen, and F. W. Haws.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-163578, Price codes: A05 in paper copy, A01 in microfiche. Water Resources Planning Series UWRL/P-80/08, December, 1980. 67 p, 7 Fig, 13 Tab, 33 Ref. OWRT-A-042-UTAH(1), 14-34-0001-9047.

Descriptors: *Droughts, *Drought vulnerability, Stochastic processes, *Model studies, *Utah, Drought tolerance, Water supply, Irrigation, Municipal water, Drought effects, Salt Lake County(UT), Utah 1977 drought.

This summary completion report describes the project work completed in three areas: (1) the development and preliminary testing of drought severity and vulnerability indices, (2) the impacts of Utah's 1977 drought, and (3) an operation comparison of stochastic streamflow models. The drought indices were evaluated for three municipal and three irrigation water supply systems in Utah. It was concluded that a continuous loss function to define the effects of water shortage would be more appropriate than the existing assumption that drought-related losses occur suddenly at a certain degree of water shortage. Information on the impacts of Utah's 1977 drought was collected by surveys of municipal and rural domestic systems, water users in Salt Lake County, and farmers, stockmen, ranchers, and irrigation company officials. Survey results were used to examine drought effects in different regions of the state and with respect to size of municipal supply systems. Despite severe restrictions placed on Salt Lake county water users most did not consider the experience an 'undue burden'. The comparison of five stochastic streamflow models on four Utah streams lead to a preliminary model choice strategy which is based on the historical estimates of the lag-one autocorrelation and Hurst coefficients.

CHANGE: A MANAGEMENT PROBLEM OR A PROBLEM WITH MANAGEMENT,
Honolulu City and County Board of Water Supply, HI.
K. Hayashida.
Journal of the American Water Works Association, Vol 72, No 11, Part 1, p 612-613, November, 1980.

Descriptors: *Management, *Productivity, *Water works, Public utilities, Personnel management, Administration, Employee relations, Honolulu, Costs.

Management of water utilities must respond to changes in order to maintain productivity. Examples of implementing changes with minimum employee resistance are given from an experience in the Honolulu Board of Water Supply. Overtime was cut from $400,000 in 1974 to $256,000 in 1975 by transferring some tasks to other city departments and managing overtime requests more carefully. Staff cut-backs were made slowly through attrition and assigning certain jobs to outside contractors. Take-home cars for emergency transportation were reduced from 73 to 42, with immediate complaints from affected personnel but considerable savings to the utility. The department was decentralized from a vertical pyramid with 5 major divisions into 9 divisions with shorter lines of communication to the executive level. (Cassar-FRC)

TREATED WATER DEMAND AND THE ECONOMICS OF REGIONALIZATION: VOLUME 1. THE RESIDENTIAL DEMAND FOR TREATED WATER,
Alabama Univ., University.
B. P. Helms, and J. F. Vallery.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-145617, Price codes: A05 in paper copy, A01 in microfiche. Environmental Protection Agency Report EPA-600/2-80-162, August, 1980. 93 p, 5 Fig, 14 Tab, 22 Ref, 3 Append. R805617.

Descriptors: *Domestic water, *Water demand, *Water rates, *Economics, Water utilization, Lawns, Water conservation, Irrigation practices, Pricing, Income, Appliances.

The present and future demands and costs for residential water are examined in view of the new requirements for water quality standards under the Safe Drinking Water Act of 1974. The determinants of residential water demand, including water price, family income, and appliance ownership were investigated using data from two surveys of utility customers. A methodology was developed by which utilities can determine future customer demand. It was found that the number of persons in the home and family income are the most important determinants of water consumption. Price affects consumption, but much less than has been indicated in most previous studies. The presence of various water-using appliances affects the use of water, but this is generally a reflection of income, and therefore information on appliances may be redundant if accurate income data are available. The percent of customers irrigating increases with income, but heavy waterers are found scattered throughout the moderate-to-high income levels, and are in the minority at all income levels. Completely eliminating lawn irrigation cannot greatly curtail the need for new water supplies, since irrigation water accounts for only about 3.5% of total use. Significant water conservation is unlikely to be achieved through the use of rational rate increases. Future reductions in water demand will more than likely come from technological changes in the household water-consuming appliances. An increasing block rate structure may be feasible only in systems with computerized billing systems, and it would induce only limited conservation with relatively high, widely publicized rates. The primary advantage would be that the revenue would be collected from these primarily responsible for the peak load. (Moore-SRC)

BREAKING THE COST BARRIER TO HOUSEHOLD WATER SERVICE,
E. F. Lowry.
Journal of the American Water Works Association, Vol 72, No 12, p 672-677, December, 1980.

Descriptors: *Domestic water, *Cost analysis, Water costs, Water distribution(Applied), Construction costs, Water utilization, Potable water, Water demand, *Philippines.

The Barangay Water Program in the Philippines is used as an example of one way of providing economically feasible water systems connected to private households in rural, low income areas in developing nations. A key aspect of the success of this program has been the reduction of the per capita construction cost as much as possible. The Barangay Water Program under the Ministry of Local Government and Community Development set forth a technical manual covering design criteria that are to be used, determinations for size and locations of storage, selection of pipeline sizes, presentations of materials specifications, and prepartion cost estimates. This approach has allowed the program to proceed under sound economic designs. Much of the cost reduction seen in the program has resulted from the standardization of design criteria. Additional savings were realized through the use of standardized storage in a standpipe configuration instead of conventional elevated storage tanks. The choice of materials was the last factor which contributed to the cost reductions. The potential for consumption would indicate that the day begins with the equivalent of 5 cans of water (each can equalling a 5 gal kerosene can) in storage per home. The water enters the home at the rate of 23 liters (6 gal) per hour. Level 3A services such as this were in place in 8 diverse locations around the Philippines by May, 1980. In the future a water system is expected that will pipe water into rural areas at 450 liters (120 gal) per day in the home for less than $21 per capita construction cost. (Baker-FRC)

NATIONAL MUNICIPAL POLICY AND STRATEGY: TIGHTENING THE SCREWS,
D. V. Feliciano.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 3-7, January, 1980. 1 Fig, 1 Tab.

Descriptors: *Water quality control, *Legislation, *Clean Water Act, National Municipal Policy and Strategy, Government supports, Permits, Water policy, EPA, Water institutions.

The National Municipal Policy and Strategy was signed by the EPA in 1979 and is viewed as a vehicle for dealing with the almost 60% noncompliance of some 17000 publicly owned treatment works (POTWs). These POTWs were failing to cooperate with the 1977 guidelines and treatment requirements that had been previously established. The municipal strategy will permit examination of those POTWs that are not in compliance with the standards set in 1977 and will determine whether they are eligible for extension of the deadline provided for under the Clean Water Act. Specific compliance schedules will be drawn where applicalbe. In cases where enforcement is necessary, the municipal strategy will coordinate this with the availability of construction grant funds and with reordered state priority lists. (Baker-FRC)

WATER QUALITY MANAGEMENT-HAVE WE LOST SIGHT OF THE OBJECTIVE,
Mathematical Sciences Northwest, Inc., Bellevue, WA. Consulting Div.
G. R. Minton.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 131-141, March, 1980. 50 Ref.

Descriptors: *Federal Water Pollution Control Act, *Water management, Planning, Water quality, Water pollution sources, Local government, Federal government, Water quality control, *Water pollution control, Pollution abatement, Federal government, Water resources development, Water policy, *Water quality standards.

After the passage of the Federal Water Pollution Control Act Amendments in 1972, the water pollution control strategy of the United States was criticized by the General Accounting Office, the business community, scientists and professional agencies, and the National Resources Defense Council. The general complaints have focused upon the strategy's attempts at control of effluents rather than concentrating on a long-term strategic approach to achieving better water quality. The need to put receiving-water considerations back into water management decisions is stressed. To deal successfully with nonpoint pollution sources, studies must be made on the seasonality of certain beneficial uses as well as on water quality. Effective parameters must be adopted in monitoring nonpoint pollution. The evaluation of the integrity of the biological community has been suggested as an indicator or receiving water reaction to nonpoint pollution sources, but such a system would require vast sums of money for research. Little data exists on the potential benefits of improved water quality, but this situation is expected to be remedied under the 1977 Amendments. Under a proposed plan for improved water quality management, emphasis is given to nonpoint pollution, the role of local governments, monitoring, the handling of policy conflicts, the use of incentives, new technical tools and natural resource management. The need for integration of environmental objectives in urban areas is also discussed. (Geiger-FRC)

MANAGEMENT OF US WATER RESEARCH,
North Carolina Water Resources Research Inst., Raleigh.
N. S. Grigg.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol 106, No WR1, p 143-158, March, 1980. 10 Fig, 19 Ref.

Descriptors: *Water management, *Water Resources Research Act, Water resources, Planning, Administrative agencies, Research and development, Federal government, State government, Water policy, Water quality, Water law.

The United States' organizations for managing water research exist at five levels: international, national, agency, organization and project levels. The international organizations include such groups as UNESCO, WHO, and WMO. No single main national organization exists for water research in the United States, and organizational level facilities may occur in academic, government-controlled or private-sector institutions. It is estimated that an evaluation of the effectiveness of these organizations would take a substantial effort. The technology adopted to manage the US water resources has been described as a function of the quality of life society wishes to attain. Water management involves budgetary decisions and energy and manufacturing considerations on an intergovernmental level. The contributions of utilities, industries and water associations have not been fully recognized when establishing water research fund allocations. Input from these sources has been recently taken into account under the National Science and Technology Policy, Organization, and Priorities Act of 1976. New and expanded programs will be needed at the federal level to serve state and local governments and coordinate the intergovernmental aspects of water resource managment. (Geiger-FRC)

ECONOMIC DREAM OR ENVIRONMENTAL NIGHTMARE. THE LEGALITY OF THE 'BUBBLE CONCEPT' IN AIR AND WATER POLLUTION CONTROL,
Lewis and Clark Coll., Portland, OR. Natural Resources Law Inst.
J. L. Landau.
Boston College Environmental Affairs Law Review, Vol 8, No 4, p 741-781, 1980. 224 Ref.

Descriptors: *Water pollution control, *Bubble concept, *Environmental control, *Regulation, Air pollution, Legal aspects, Administrative agencies, Legislation, Water quality standards, Control, Clean Air Act, Legislation, Water Quality Act, Water policy, Water institutions, *Economics.

The 'bubble' concept or alternative emission reduction options policy is a reform proposed by the U.S. EPA to improve economic efficiency in its regulatory program. This concept offers industries an incentive to develop effective pollution control technology at the least cost. As an example, if an imaginary bubble were placed over a factory, the industry would be responsible for the total emissions, not emissions from individual pipes or stacks. The bubble concept is applied to water pollution control as well as to air pollution. The question is how to define 'point source', whether it can be considered an entire plant as opposed to individual pipes and processes. Much debate on the merits and disadvantages of the water pollution bubble system had taken place within the government, and the status of such a policy remains indefinite. Some of the objections are increased need for regulatory personnel, development of bargaining between agencies and industries, threats of environmental degradation, difficulty of verification, and mistrust of industries to comply in good faith. Rebuttals to these statements respectively cite great cost savings for industry and indirectly for the consumer, present and past use of negotiations, no change in character or quantity of discharges, and noncompliance by some businesses no matter what the system. (Cassar-FRC)

6F. Nonstructural Alternatives

WATER QUALITY AND WESTERN ENERGY - WHAT ARE THE TRADE-OFFS,
J. T. Dale.
Journal of the Water Pollution Control Federation, Vol 52, No 1, p 8-14, January, 1980. 1 Fig, 3 Tab.

Descriptors: *Water quality control, *Resources development, *Energy, Runoff, Salinity, Land management, River basin development, Water resources planning, Colorado River, Mexican Water Treaty.

The development of potential sources of energy in the western states of Montana, North Dakota, South Dakota, Wyoming, Colorado, Utah, Arizona, and New Mexico, and the impact of such development on the quality of water in the Colorado River are discussed. Both the Upper Colorado and the Upper Missouri river basins will be affected, but the former will suffer the most from the development. The water of the Colorado is already overobligated, according to some experts, and is creating a water deficiency/water quality problem in violation of a treaty with Mexico. Increased demands will only hurt the situation. Major efforts will have to be made to prevent increases in stream salinity resulting from concentration effects. Choices include better control of point sources, better control of non-point sources, or treating surface water through desalination plants. With energy development in this area, population increases are also expected, with added municipal effluent effects on the water quality. Various suggestions for improving water quality include control procedures, improved design of holding ponds, pretreatment of effluents prior to pond discharge, selection of energy conversion facilities in locations which minimize water quality problems, secondary and tertiary waste water treatment, land applications of municipal waste water, reduction of runoff from energy facilities, and reduction of runoff from agricultural lands. SOME ENVIRONMENTAL ISSUES IN WATER FOR DEVELOPMENT,
United Nations Environmental Programme, Nairobi (Kenya).
L. E. Obeng.
Water Supply and Management, Vol 4, No 3, p 115-128, 1980. 2 Fig, 2 Tab.

Descriptors: *Regional development, Regional economics, Water management(Applied), Water distribution(Applied), *Water supply development, Water resources development, *Environmental effects, Developing countries, Ecosystems.

The major environmental issues in water use for development are the availability of adequate water, water quality, the significance of water in productive ecosystems, and the efficient management of water resources. Proper resources management may include the establishment of an institutional structure to support information gathering and dissemination. Management problems are shared by most countries. Generally, manpower, equipment, and money are not sufficient for proper management. The most basic problems nations may face are the lack of sufficient water or the poor quality

of the water that is available. While water treatment and waste and sewage treatment are important, they are expensive and often beyond the means of a developing nation. The effects of necessary dams and irrigation must be considered. Water management is necessary for the improvement of life, food, shelter, clothing, and health of developing nations. (Small-FRC)

THE ENVIRONMENTAL DIMENSION IN WATER MANAGEMENT: THE CASE OF THE DAM AT SALTO GRANDE,
Bariloche Funacion, San Carlos de Bariloche (Argentina).
G. Gallopin, T. R. Lee, and M. Nelson.
Water Supply and Management, Vol 4, No 4, p 221-241, 1980. 5 Fig, 4 Tab, 6 Ref.

Descriptors: *Water management, *Model studies, *Dams, Water resources development, Ecosystems, Future planning, Social aspects, Water quality, Environmental effects, Economics, International commissions, Quality control, Dam construction, *Uruguay River, *Argentina, *Uruguay.

A bi-national Technical Commission (CTM) was formed to handle the project of construction of a dam at Salto Grande on the Uruguay River. CTM initiate numerous study programs to develop regulatory and management criteria to maintain environmental quality in the area that the dam would affect, which included land from the nations of Uruguay and Argentina. A workshop attended by CTM members defined the system to be controlled and gave as the main objective of the system the maintenance of the quality of life. This system was subdivided, yielding an economic and socio-cultural subsystem which was in direct interaction with a physical subsystem to maintain the integrity of air, water, soils, and terrestrial and aquatic biota. To gather information as quickly as possible and enhance inter-disciplinary communications, a questionnaire approach was adopted. The questionnaire focused on indicators of the state of each sector and attempted to highlight significant associations that might exist between sectors. A second workshop compiled data from the questionnaire and generated flow diagrams for each sector, showing interactions between systems. A final CTM workshop clarified actions which impacted on the water sector, the soil and terrestrial flora and fauna sector, the socio-economic sector, and actions which had chain effects through several systems. It was concluded that the model offered a viable organizational framework for coordinating research on an array of natural and social sciences. (Geiger-FRC)

7. RESOURCES DATA

7A. Network Design

SAMPLING: DEFINING THE TASK AND PLANNING THE SCHEME,
Water Research Centre, Marlow (England). Medmenham Lab.
J. C. Ellis, and R. F. Lacey.
Water Pollution Control, Vol 79, No 4, p 452-467, November, 1980. 8 Fig, 1 Tab, 4 Ref.

Descriptors: *Statistical methods, *Sampling, *Streams, Water sampling, Streamflow, Effluent streams, Influent streams, Project planning, Methodology.

Applying statistical planning increases the effectiveness of stream sampling, which includes rivers, streams, effluents, and influents. The paper emphasizes how the program design is influenced by the objective, the degree of tolerable imprecision, assumptions concerning variability in the system, and available resources. A clear objective is necessary to gather the proper amount of relevant information. Some possible objectives are as follows: to spot abnormal concentrations, to define peaks, to gather general information, to estimate mean concentration, to detect changes, to monitor processes, to determine a fair industrial effluent charge, to estimate a percentile, and to monitor for compliance. Specific instructions, as well as examples of applying the statistical method, are given for each of these objectives. (Cassar-FRC)

Descriptors: *Water quality changes, Water quality monitoring, *Mathematical models, Water quality management, Hydrologic data, Simulation analysis, Statistical methods, Correlation analysis, Evaluation, *Time series analysis.

The detection of change in a hydrologic variable, particularly in water quality, is a current problem. A method of formulating this problem in a mathematical programming context is presented. The method is based on using weighted linear combinations of water quality variables from different locations with the weighting factors being adjusted so that the time required to detect the change is minimized. The basis of the technique, then, is a trade-off of time by adding information from other locations. The results of example applications show that significant savings in time can be achieved by using this method. Since the detection method is based on sample statistics developed from historic data, uncertainty exists as to how accurately the optimal values of the time required to detect the change and the weighting factors reflect the true, but unknown, values. A method of evaluating the reliability of these estimates is presented using an analytical solution of the optimization problem. Through this approach, expressions are obtained relating explicitly the optimization variables to the random variables of the problem, giving a clear picture of the interrelationships. Simulation is then used to evaluate the behavior of the optimization variables through these explicit relations.

A REMOTE SENSING TECHNIQUE TO MONITOR CLADOPHORA IN THE GREAT LAKES,
Environmental Research Inst. of Michigan, Ann Arbor.
F. J. Tanis.
Environmental Protection Agency Report EPA-600/3-80-075, July, 1980. 36 p, 12 Fig, 4 Ref. R803611.

Descriptors: *Great Lakes, *Cladophora, *Remote sensing, *Eutrophication, Lake Ontario, Algae, Nuisance algae, Aquatic plants, Biomass, Analytical techniques, Distribution, Water pollution, Standing crops, Monitoring, Mapping, *Aerial photography, Multispectral scanner.

The presence of the nuisance alga Cladophora along parts of the Great Lakes shoreline is one of the negative consequences of excess inputs of pollutants into the Lakes and their contributing rivers and streams. An airborne multispectral scanner was used to monitor Cladophora at two sites on the Lake Ontario shoreline near Rochester, New York. Computer generated color maps were produced to show spatial distribution of Cladophora in the nearshore zone and to estimate standing crop. Recognition of Cladophora biomass from aircraft imagery requires gathering Cladophora samples at known locations. Sampling locations can be marked with highly reflective floats which are visible in the multispectral imagery. The use of multispectral digital instrumentation allows development of automatic recognition techniques. Results can be displayed as high resolution maps for selected areas and to compile standing crop estimates over large reaches of shoreline. Specific influences of local sources of nutrients of various environmental contaminants on the growth and extent of Cladophora should be monitored using this aerial technique with multiyear surveys. Improvements in local water quality as a result of implementation of remedial programs can be expected to affect Cladophora growth and therefore are observable in the airborne surveys. (Moore-SRC)

RECOMMENDATIONS FOR USE OF SI UNTS IN HYDRAULICS,
M. S. Petersen.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 106, No HY12, p 1981-1994, December, 1980. 11 Tab, 8 Ref.

Descriptors: *Construction, *Standards, *Measurement, Technical societies, Metric system, International System of Units, Hydraulics, Hydraulic engineering, *International system of units(SI).

Basic information is presented on the International System of Units (SI), including recommended units, in a suitable form for hydraulic engineers The following are included: a table for conversion to SI units of physical quantities frequently used in water resources practice, such as acceleration, energy/area-time, force, and heat; and tables of equivalent units for length, area, volume, flow rate, velocity, mass, force, and physical properties. The information presented is the result of meetings and questionnaires from the ASCE Committee on Metrication. While changeover to the use of SI is voluntary, the changeover is to start in the construction industry on January 1, 1981. By January 1, 1985, most of the construction industry will work in the metric system. (Small-FRC)

A DESIGN FOR A SIMPLE UNDERWATER IRRADIANCE METER,
Liverpool Univ., Port Erin (England). Dept. of Marine Biology.
T. H. Moller, and H. Bailey.
Estuarine and Coastal Marine Science, Vol 11, No 3, p 347-352, September, 1980. 5 Fig, 9 Ref.

Descriptors: *Instrumentation, *Light intensity, *Irradiation, Performance, *Aquatic animals, Aquatic environment, Calibrations, Measurement,

Light attenuation, Light penetration, Extinction coefficient.

The assembly, calibration, and performance of an irradiance meter intended for underwater measurements in a single waveband are described. The meter utilizes seven Clairex cadmium sulfide photoconductive sensors and a Field Effect Transistor Volt Ohm Meter to measure changes in resistance of the coupled photoconductors. Calibration follows the method of Jones (1970) and Arnold (1975). A calibration curve was constructed by placing a succession of neutral density filters in a known light path. The irradiance meter is simple to deploy and operate even from small vessels. Since the meter is independent of an external power source, a diver can take in situ irradiance readings. At depths of 70 m, 60 seconds are required to obtain a constant reading. Ten to the minus 7th watts per square meter represents the minimum irradiance level which is accurately detected by the meter, but the response time of about five minutes for values below ten to the minus 6th watts per square meter may in some cases be impractical. Instrument performance is discussed in relation to angular light response, immersion effect, response time, temperature dependence, and filter band width error. (Small-FRC)

U.S. Patent No 4, 199,453, 7 p, 5 Fig, 8 Ref; Official Gazette of the United States Patent Office, Vol 993, No 4, p 1373, April 22, 1980.

Descriptors: *Patents, *Intakes, *Powerplants, *Aquatic life, Filters, Entrainment, Engineering structures, Impingement.

An apparatus for protecting aquatic life carried by water passing through a vertical traveling band screen unit has inwardly opening screening baskets. Each basket carries a longitudinally extending, inwardly projecting baffle adjacent its trailing side with the portion adjacent the basket being imperforate. The area along the length of each basket at the inner side of the baffle is imperforate and defines with the baffle a pocket for receiving water and aquatic life carried upon upward movement through the water. It is adapted to discharge the water and aquatic life upon movement of the pocket to a predetermined elevation. A low pressure stream of water transfers the aquatic life from the pocket to a discharge trough located inwardly of the screening unit. (Sinha-OEIS)

RELIABILITY OF DAMS SUBJECTED TO HYDRODYNAMIC FORCES DURING EARTHQUAKES,
Delaware Univ., Newark. Dept. of Civil Engineering.
V. Chiarito.
Available from the National Technical Information Service, Springfield, VA 22161 as PB81-163594, Price codes: A06 in paper copy, A01 in microfiche. MS Thesis, June, 1981. 97 p, 20 Fig, 18 Tab, 18 Ref, 5 Append. OWRT-A-047-DEL(3), 14-34-0001-0108.

Descriptors: *Design criteria, *Dams, *Reservoirs, Earthquakes, *Hydrodynamics, Structural geology, Engineering structures, Equations, Random hydrodynamic force, Delaware, Hoopes Dam(DE).

The assumptions and formulation of the governing wave equation are presented for the dam-reservoir system. The equations for the random hydrodynamic force and moment response are derived in a nondimensional form. Using random vibrations theory reliability functions are formulated for stability criteria concerning sliding and overturning. An application of the final results to Hoopes Dam in Delaware is presented. In this thesis the safety of the dam-reservoir system is analyzed by a probabilistic approach. Other works are cited; and nonstationary models used for the acceleration and response force are explained. The equations involve integrals with no known analytic solution. Thus, the integrals need to be evaluated numerically. All the numerical results are presented and discussed. Comparisons to approximate solutions are made to determine the validity of the numerical results. Finally, extensions from this study for future research are noted.
